Chancellor of the University of Cambridge.

VICE-PRESIDENTS.
The Mayor of Sheffield, John Brown, esq.
The Master Cutler.
The Right Hon Lord Wharncliffe.
Sir David Brewster, K.H. D.C.L. F.R.S.L. & E. M.R.I.A.
Sir Roderic Murchison, F.R.S. Director of the Royal School of Mines.
John Percy, esq. M.D. F.R.S. Professor of Metallurgy in the Royal School of Mines.
William Fairbairn, esq. C.E. F.R.S.
Robert Hunt, esq. F.R.S. F.S.S. Keeper of Mining Records
Warrington W. Smyth, esq. M.A. F.R.S. Professor of Mining and Mineralogy in the Royal School of Mines.

DIRECTOR.
The Rev. G. B. Atkinson, M.A. Principal of the Collegiate School; late Fellow and Assistant Tutor of Trinity Hall, Cambridge.

PROFESSORS.
Chemistry, Metallurgy, and Geology.—James Allen, Ph.D. F.C.S. of the Universities of Giessen and Berlin.
Engineering and Mining.—J. Thomas, C.E.
Mathematics, Natural Philosophy, and Applied Mechanics.—Rev. G. B. Atkinson, M.A.

The Sheffield School of Practical Science and Metallurgy will afford a complete scientific and practical education to students who are desirous of becoming civil, mechanical, or mining engineers, or manufacturers of any kind. Its object is thoroughly to develope the student in the principles of those sciences upon which the operations of the engineer, metallurgist, or manufacturer depend.

Practical education will be given by means of systematic Courses of Lectures, by Catechetical Class Instruction, by Practical Teaching in the Laboratory and Drawing room, and especially by Field Excursions.

In the Buildings of the Sheffield Collegiate School. The two Institutions, although both under the superintendence of the Rev. G. B. Atkinson, Principal of the College, are local, are, however, entirely distinct.

A detailed Prospectus, containing Syllabuses of all the Courses of Lectures, and all other information, arrangements for boarding, &c. may be obtained by application to the Director.

THE SCHOOL WILL OPEN IN THE FIRST WEEK IN FEBRUARY, 1863.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.—The next SESSION commences on SATURDAY, FEBRUARY 7th.—Students entering the College at this time are eligible for Election to a Scholarship.—For prospectuses and further particulars apply to the Principal.

COMPETITIONS.

TO SCULPTORS.—The COUNCIL of the ART UNION of LONDON propose to award the sum of SIX HUNDRED POUNDS for a GROUP, or SINGLE FIGURE in MARBLE, to be competed for by finished models in plaster, the size of the intended work, which must not be less than five, assuming five feet as the minimum. The models are to be sent in by the 1st of MARCH, 1864, and the work is to be completed in the best statuary marble, by the 1st of MARCH, 1865. Two hundred pounds will be paid on the award of the premium, and the remainder on the completion of the marble. The Council reserve to themselves the right of withholding the premium if a work of adequate merit be not submitted. The competition is open to artists of all countries.

GEORGE GODWIN, } Honorary
LEWIS POCOCK, } Secretaries.

444, West Strand, Feb 2, 1863.

PLYMOUTH WESLEYAN CHAPEL, &c. and the ARCHITECTURAL ALLIANCE.—Members of the Allied Societies are informed that a communication has been made to the Manager of the competition by the Hon. Secretary of the Alliance; and all members are requested to refrain from competing until the conditions are satisfactorily altered. See letter in columns of "The Builder."

TESTIMONIAL to Sir BARTLE FRERE, K.C.B.—To ARCHITECTS.—DESIGNS, to consist of complete working drawings and detailed estimates, are invited for a BUILDING to be erected in Karra-hee, Scinde, to be called the Frere Hall. 500 will be paid to the author of the selected design, which will thus become the property of the Frere Hall Committee. Competitors must send their plans under a motto and cased to the Joint Secretaries, Frere Hall Committee, Kurrachee, Scinde, on or before the 30th of APRIL next, accompanied by a sealed envelope containing name and full address of the designer. The Committee will use every possible care in returning the plans to the unsuccessful competitors; but they will not be answerable for loss or damage to the plans in transit. A plan of the site may be seen on and after MONDAY next, the 9th inst. at the Offices of Mr. BRUNTON, M.I.C.E. Chief Engineer Scinde Railway, 31 and 32, Commercial Sale Rooms, Mincing-lane, City, who will furnish full particulars of the funds available and of the building requirements; also information as to the local prices of materials and workmanship.

TO ARCHITECTS.—A PREMIUM of 25*l*. is OFFERED for the BEST PLAN for LAYING OUT EIGHT ACRES of LAND, at Ripon, in building sites, with the elevations of detached and semi-detached villas, of from 30*l* to 50*l* rental.—Plans to be sent in by the 25th MARCH.—For further particulars, and to view the ground, application must be made to

ROBERT WILKINSON, Jun. } Hon. Secs.
JOSEPH STEVENSON, }

Ripon, February 2nd, 1863.

CONTRACTS.

TO CONTRACTORS.—SHEERNESS DRAINAGE WORKS.—CONTRACT, No 1 OUTLET PIPE.—The Sheerness Local Board of Health hereby give notice, that they are prepared to receive TENDERS from persons willing to CONTRACT with them for PROVIDING and LAYING DOWN about 1,200 LINEAL FEET of CAST IRON FLANGED and SOCKET PIPES, 24 inches in diameter, with tidal flap. Plan, sections, and specification, may be seen, and forms of tender obtained, by applying to Mr. JAMES LUND, the Surveyor of the Board, at his Office, No. 10, Montague terrace, Sheerness. Sealed Tenders, indorsed "Tender for Outlet Pipe," are to be delivered at the Office, not later than THURSDAY, the 12th FEBRUARY, 1863, at SIX o'clock in the evening.—By order of the Sheerness Local Board of Health,

EDWARD FELKIN, Clerk.

Office of the Local Board of Health, Sheerness, January 15, 1863.

DELAMERE, CHESHIRE.—The Commissioners in charge of Her Majesty's Woods and Royal Forests hereby give notice that TENDERS will be received for the ERECTION of a HOUSE and OFFICES, a HOMESTEAD, BAILIFF'S HOUSE, and TWENTY LABOURERS' COTTAGES, at Delamere, near Hartford, in the County of Chester. Drawings and specifications may be inspected, on application to Mr. MOODIE, at the Abbey Arms Inn, Delamere, on and after the ELEVENTH instant, and further particulars obtained on application to Mr. JOHN CLUTTON, 9, Whitehall-place, Westminster.

Tenders to be sent in on or before the 9th day of March, addressed to the Honourable JAMES A. HOWARD, Office of Woods, Whitehall Place, Westminster, S.W. endorsed, "Tender for Works at Delamere."

The Commissioner does not bind himself to accept the lowest or any Tender.

TO BUILDERS.—TENDERS are required for the ERECTION of OFFICE and BOARD-ROOM, with RESIDENCE attached; also four shops adjoining, in a plot of ground at the corner of Eleanor-road and Powis-street, Woolwich. The plans and specifications may be seen at the Offices of Messrs. CHURCH & RICHWOOD, Architects, Waldram-street, Woolwich, where all further information may be obtained. The Tenders to be sent in on FRIDAY, the 13th instant, before TWELVE o'clock. The lowest or any Tender will not necessarily be accepted.

Woolwich, 4th February, 1863.

[*For remainder of Contracts see next Page.*

DURABILITY of GUTTA PERCHA TUBING.—Many inquiries having been made as to the Durability of Gutta Percha Tubing, the Gutta Percha Company have pleasure in giving publicity to the following letter FROM SIR RAYMOND JARVIS, Bart VENTNOR, ISLE of WIGHT.—Second Testimonial:—"March 10th, 1852. In reply to your letter received this morning, respecting the Gutta Percha Tubing for Pump Service, I can state with much satisfaction, it answers perfectly. Many builders and other persons have lately examined it, and there is not the least apparent difference since the first laying down, now several years, and I am informed that it is to be adopted generally in the houses that are being erected here."

N B From this testimonial it will be seen that the CORROSIVE WATER of the ISLE of WIGHT has no effect on Gutta Percha Tubing.

PERIN'S PATENT BAND SAW BLADES.
B. WORSSAM & CO. beg to announce that they have purchased of Mons. Perin, of Paris, the exclusive right to SELL his celebrated BAND SAW BLADES (the superiority of which is universally allowed in the United Kingdom 8, W. & Co. have always a large assortment of these Saws at their Works, No. 305, ROMAN ROAD, LMEHOUSE, A.S. where also the Band Saw Machine exhibited by Mons. Perin in the Western Annexe, International Exhibition, is now on sale.

TO BUILDERS, CONTRACTORS, AND OTHERS.
AN OVERHEAD TRAVELLER with single purchase crane, spur and pinion wheels, spindles and stretchers pair 4-inch 2 and 3-sheave wrought iron blocks, length 5 301 x inch chain about 300 feet; 2 trussed girders 17 feet long each 4 cast iron travelling wheels, and 2 length s 3 by 1-inch girder iron pair rail 30 feet long each, two 12 by 12 inch horizontal timber bearers 40 feet long each, and 4 uprights 12 by 6-inch timber supports 10 feet each—For particulars, apply to Mr. S. H. RODMAN, 8, Vauxhall Bridge-road, S.

PAIR of HORIZONTAL HIGH PRESSURE and CONDENSING STEAM ENGINES, each 4 horse power—FOR SALE by private contract. The cylinders are 1 foot 8 inches diameter, 3 feet stroke, with metallic pistons, bright connecting rods, slide valves, eccentrics, 8 inch fly-wheel shaft, crank and pinion, exhaust pipe, cast iron condenser, cast-iron feed pumps, steam and vacuum gauges, pair of bright governor balls and apparatus, made in 1851.—For further particulars apply to Messrs. FULLER & HORSEY, 13, Billiter-street, London, E.C.

ST. PANCRAS IRON WORK COMPANY,

OLD SAINT PANCRAS ROAD, LONDON, N.W.

PATENT WROUGHT-IRON STABLE FITTINGS

SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—

That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick, or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, WITH RACK AND WATER-TROUGH,

The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.

These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible; advantages peculiarly their own.

THE PATENT HARNESS FITTINGS

Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.

EVERY DESCRIPTION OF STABLE FURNITURE.

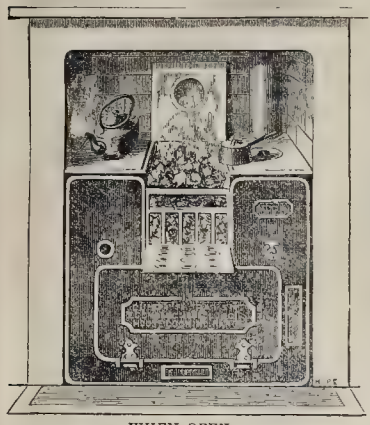
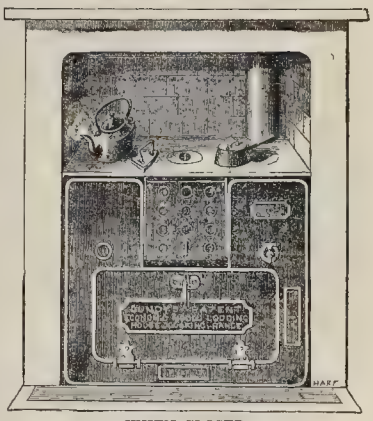
J. TYLOR & SONS' PATENT BATH APPARATUS.



The bath and boiler may be fixed in the same or separate rooms, anywhere below the level of cold water cistern. Open or close fire at pleasure. No brickwork setting for boiler required.

Estimates given from architects' drawings, or by inspection of buildings.



Catalogues, containing Nine Illustrations of different methods of heating baths, sent on application to the Manufacturers, J. TYLOR & SONS, Warwick-lane, Newgate street, London.

CUNDY'S MULTUM IN PARVO ECONOMIC POOR MAN'S KITCHENER.

WHEN OPEN.

These drawings represent a Stove of the following dimensions:—24 inches long, 24 inches high, and 15 inches deep, when used as an open fire-stove, and also when closed, for BAKING, BOILING, and IRONING. The oven, which is placed underneath the fire, is 18 inches long, 14 inches deep, and 11 inches high. The flue passes all round the Oven, and the Boiler will contain six gallons of water. This Stove, which is also made 30 inches long, 26 inches high, and 15 inches deep, is admirably adapted for BACK KITCHENS, as an auxiliary Cooking Stove, and for STILL-ROOMS, NURSERIES, and SMALL HOUSES, the consumption of coal being only 112 lbs. per week. This Stove, also Cundy's Patent BRICK OVEN Double Fall-down Bar KITCHEN RANGE; also Cundy's Warm-Air Ventilating Stove, suitable for CHURCHES, HALLS, STAIR-CASES, and SCHOOLS, for which invention Mr. Cundy received the SOCIETY OF ARTS MEDAL, also a Medal from the Royal Commissioners of the GREAT EXHIBITION of 1851, can be seen in operation daily, at the Show-rooms of THE MANUFACTURER,

WHEN CLOSED.

FIRE-PROOF CONSTRUCTION.—

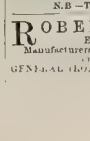
FOX & BARRETT'S PATENT.

This improved system of fire-proof construction has been most extensively adopted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether Public or Private. The system combines ECONOMY with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.

The floors are formed by a combination of joists of wrought or rolled iron with concrete, so constructed that each floor becomes in effect a beam of artificial stone with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring-boards, or of cement, asphalte, tiles, slate, or other material.

Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as superseding the necessity for cast-iron girders and brick arches, and as bringing the great essential of fire-proof construction, even for ordinary dwelling-houses and domestic buildings, within the reach of every one.

Further information may be obtained of the Proprietor of the Patent,



MR. BARRETT,

12, YORK BUILDINGS, ADELPHI.

We invite particular attention to the PATENT LOCK FURNITURE, which we do not hesitate to say is the most perfect article now manufactured, great improvements having been recently made in it. It has been extensively used in public and private buildings, in Her Majesty's Pavilion and Camp at Aldershott—alone, many hundred sets without one single failure. It is applicable to all Locks and Latches, both rim and mortise, and effects a most secure fastening, without any screw in the neck of the knob. Perfect action guaranteed in both Locks and Furniture, if the Locks are of our own manufacture.
New rich designs in glass, china, brass, bronzed, gilt, carved woods, metal, &c. &c. or to any design.
THIS FURNITURE MAY BE HAD WITH PLATES OR NUTS.
A most complete and extensive stock of every description of locks, latches, brass foundry, and ironmongery required for buildings, of the best quality manufactured, at the lowest wholesale prices.
*** Illustrations and particulars sent upon application.

NOW OPEN, YOUNG'S IRONMONGERY WAREHOUSE,
No. 2½, Davies-street, Three Doors from Oxford-street.
For the supply of Builders, Carpenters, Upholsterers, Smiths, Bell-hangers, and the Trade in general, at wholesale prices. In connection with his Old Establishment, No. 18, Blandford street, Manchester-square, running out of Baker-street, Portman-square, London, W.

The PRIZE MEDAL for SUPERIOR PATENT SASH and BLIND LINES, was awarded to JAMES AUSTIN, at the INTERNATIONAL EXHIBITION, 1862
AUSTIN'S IMPERIAL PATENT SASH and BLIND LINES
To BUILDERS, CARPENTERS, and BLIND MAKERS.
J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his
IMPERIAL PATENT FLAX SASH-LINES
of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.
ESTABLISHED 1774.

PATENTED HOT AIR APPARATUS in CAST IRON, consisting of prismatic tubes, to be applied to chimneys with flues and heat-conductors. By this system is obtained less fuel, durability, a clear fire, security, economy. An apparatus in use can be seen, every day, at the Office of M. LEWAL, Nos. 5 and 6, Philpot lane, City.

IRON RAILINGS, for enclosing TOMBS and GRAVES.

COMMUNION RAILINGS, SCREENS, GATES, &c.
Illustrated price catalogue, of numerous designs, in various styles (free), on application to
COTTAM & CO. IRON WORKS,
2, WINSLEY-STREET, OXFORD-STREET, LONDON, W.

OLD RAILS, GIRDER and BEAM IRON, FOR SALE.
Apply to
WILLIAM BIRD & CO.
2, LAURENCE POUNTNEY HILL, E.C.

CHUBB'S LOCKS with all the recent improvements.
STRONG FIRE-PROOF SAFES, CASH AND DEED BOXES.
Complete Lists of Sizes and Prices may be had on Application.
CHUBB and SON,
57, ST. PAUL'S CHURCH-YARD, LONDON,
28, Lord-street, Liverpool; 16, Market-street, Manchester; and Horsley-fields, Wolverhampton.

A HIGHLY-FINISHED 10-Horse Power High-pressure STEAM ENGINE.
A Second-hand IRON RACK CIRCULAR SAW BENCH, and a small DOUBLE MOULDING MACHINE, TO BE SOLD cheap Apply to S. WORSSAM & CO. Saw Mill Engineers, King's-road, Chelsea, S.W.

PRIZE MEDALLISTS OF THE GREAT EXHIBITION, 1851. **BUNNETT & CO.** ORIGINAL PATENTEES AND MANUFACTURERS.

Invite the attention of Architects, Builders, and the Public, to their recent Improvements in

REVOLVING IRON AND COPPER SHUTTERS,

Thief-proof and Fire-proof, varying in price from 3s. 6d. to 6s. 6d. per Foot super. according to description and quality, inclusive of the Gearing for raising and lowering them.

WORKS, DEPTFORD, KENT; LONDON OFFICE, 17, QUEEN-STREET, CITY; GLASGOW OFFICE, 199, BUCHANAN-STREET.

BY ROYAL LETTERS PATENT. **BUNNETT & CO.**

Invite the attention of Architects to a completely new

Combination of the Revolving Iron Shutter and the Louvre Blind,

Especially suitable for all Tropical or Semi-Tropical Climates, or for Private Mansions in England, where thorough Ventilation and Shade are required, together with perfect security.

15, GATE STREET, LINCOLN'S INN FIELDS, LONDON.

IMPORTANT TO ARCHITECTS, ENGINEERS, BUILDERS, RAILWAY, AND OTHER COMPANIES.

VIEILLE MONTAGNE ROOFING ZINC.

Company's General Agency, 12, Manchester Buildings, Westminster.

Zinc properly laid has been proved by most extensive and long experience in France, Belgium, and Germany to be a most secure, durable, and economical covering, and is now preferred to all other materials for roofs. Its extreme lightness makes it most valuable for covering buildings requiring large spans with comparatively light framing. On a rough calculation it may be estimated that not less than 41,000,000 square feet is the average quantity of Roofing surface now annually covered in the above countries alone. Within the last few years persevering efforts have been made to introduce into England proper workmanship, in accordance with the principles which are observed on the Continent, and which alone can secure the sound and perfect construction of a Zinc roof. To aid in extending as much as possible the knowledge of these simple rules, models showing all the details are to be seen in the Architectural Exhibition in Conduit-street, and the following, selected out of a very great number of recently constructed roofs, are referred to as examples:—The Patent Granary, West-India Docks; Copenhagen Works, Limehouse; a private house in Holland Park; Homes for Poor Merchants' Clerks, Muswell-hill; a large Warehouse, 77, Thames-street; Ship roof, Sheerness Dockyard; the Victoria Station, Pimlico; the Stations in the Metropolitan Railway; the Stations of the Madras Railway Company (400,000 feet); the Warehouse of Messrs. Oakes, Brothers, & Co. Madras (20,000 feet); the Refreshment Rooms at the Exhibition; the Verandah of the Horticultural Society's Conservatory; Gloucester Railway Station; Messrs. Horniman & Co.'s Tea Warehouse, Wormwood-street; Messrs. Hoare & Co.'s Brewery, Smithfield; Cape Town and Wellington Railway (60,000 feet); Fifty new Dwelling Houses at Palace Gardens-terrace, Kensington; Twenty ditto, Inverness-terrace, Bayswater.

Plans, Estimates, and all useful information will be furnished, without charge, by applying to either of the Directing Architects.

JAMES EDMESTON, 5, Crown-court, Old Broad-street.
R. G. FISHER, 12, Manchester-buildings, Westminster.

N.B. No covering can be more economical, durable, and secure than Zinc when well laid, but good Zinc badly laid will spoil the roof, and, with a view still further to encourage good work, a special Discount will be allowed to all persons upon the Zinc used in roofs, when certified by either of the above Architects to be properly laid.

BATH STONE OF BEST QUALITY.

RANDELL & SAUNDERS, Quarrymen and Stone Merchants, Bath.

List of Prices at the Quarries and Depôts, also Cost for Transit to any part of the United Kingdom, furnished on application to BATH STONE OFFICE, CORSHAM, WILTS.

BENSON'S WATCHES AND CLOCKS.

"Perfection of Mechanism."—*Morning Post.*

Watches and Clocks of every description, from the plainest to the highest quality of which the Art is at present capable.

BENSON'S ILLUSTRATED PAMPHLET (free by post for two stamps) ON WATCHES contains a short History of Watch-making, full descriptions and prices. How to economize in the purchase of a Watch, and enables those who live in Scotland, Ireland, Wales, the Colonies, India, or any part of the World, to select a Watch, and have it sent free and safely post.

Watches.	Clocks.
Chronometer, Pocket, Lever, Horizontal, Vertical, Minute, Half-quarter, and Quarter Repeaters, Lacapement and Plain Centre Seconds, Keyless, Chronographs, Etc., Astronomical, and Reverse Dial Watches	Drawing room, Dining room, Bedroom, Library, Hall, Staircase, Bracket Carriage Chime, Musical, Astronomical, Church, Turret, Stable, Railway, Post office, Ship, Warehouse, Office, or Counting House
FROM 200 Guineas TO £3. 3s. each.	FROM 1,000 Guineas TO £1. 1s. each.

Clocks and Bronzes manufactured from High Art Designs by English, French, and Italian Artists of great celebrity.

ESTIMATES GIVEN FOR CHURCH AND TURRET CLOCKS.

OPINIONS OF THE LONDON PRESS UPON BENSON'S GREAT CLOCK AND WATCHES.

"As a sample of English clockwork on a large scale, the works of this are probably the finest finished that have ever been seen in this country. No admirer of mechanism should leave it unseen."—*Times*, June 11, 1862.

"A triumph of ingenuity."—*Daily News*, March 31.

"The entire finish is of the highest class."—*Builder*, May 29.

"A more splendid and exquisitely-finished piece of mechanism we have never seen."—*Standard.*

"The largest, and unmistakably the best finished clock in the Exhibition."—*Engineer*, Aug. 1, 1862.

"Some of them are of great beauty; and if the English watch-trade only follow up with the same spirit and success this first attempt to compete with foreigners in decorative watches, there seems to be no reason why we should not get the trade entirely into our own hands."—*Times*, June 25.

33 & 34, Ludgate-hill, London.—Established 1749.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint obliterated with Sulphate of Barytes from ten to thirty per cent. Whether sold under the name of "Improved Zinc Paint," or as the number Two or three quantities, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other. Put up for their best work.

CHEAPNESS.—Not only is it cheaper per Hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 34, LIME STREET, LONDON.

A STOCK OF THE ABOVE ALWAYS ON HAND.

JAMES LYNE HANCOCK,
VULCANIZED INDIA-RUBBER WORKS, GOSWELL-MEWS, GOSWELL-ROAD (opposite Spencer street), LONDON, E.C.

The Builder.

VOL. XXI.—No. 1044.

Mr. Fergusson's History. Ethnology of Art.

THE "History of the Modern Styles of Architecture," by Mr. Fergusson, is too important in the present condition of our art, to be left with the notice that we gave of it immediately on its publication, which notice however presented a sufficient indication of the general spirit of the work, along with the heads into which it is divided.* Though it would be easy to find in the book itself, sufficient testimony to our view that prospects are not so bad as the author would seem to regard them for the Anglo-Saxon race especially, expressions of opinion in the work deserve to be weighed, whilst the narrative of the course of architecture in the present and the three preceding centuries, had not previously been given with a like completeness; and indeed for many parts of the world, and for the really important period comprised in recollection of living men, it had been touched hardly at all. We might almost take credit to ourselves for pointing out in this journal, that there was such a field of architectural history as what is here referred to, and for urging that its study was essential to the adjustment of right measures for the future. This history Mr. Fergusson has presented in a manner which, if showing that upwards of 500 pages, and of 300 illustrations, do not go near to exhausting the subject, may be quoted as an example of how history should be written.

It has been held by some one, that history, as of states and governments, was all the better treated if under some of the leaning which is that of a partisan; and Mr. Fergusson of course felt that he had a purpose when he sat down to write. That purpose was to show by something more than assertion,—which has been made repeatedly of late, and with too little effect upon the public,—that copyism and the exhibition of learning are not architecture, and that "buildings which delight the scholars and archæologists of the day, but which the less educated classes can neither understand nor appreciate," will "lose their significance the moment the fashion which produced them has passed away." He considers that in the sixteenth century,—

> ... "men forsook the principles on which this and all other cognate arts had been practised from the beginning of time; they forsook common sense and common prudence, not in the hope of attaining greater convenience or greater effect, more easily, or with less means, but in order to reproduce certain associations with which education had made them familiar."

To the period of commencement, or which ultimately grew to the effort to reproduce, he confines the designation "Renaissance;" whilst he calls "Revival," any modern use, in fact or intention, of an old style.

Just as Cooking may be refined into Gastronomy, so may, he says, the "technic" or *useful* art, Building, be refined into the *fine* art, Architecture; and so long as that common-sense path was followed, progress was achieved. Architecture, "the æsthetic form of the purely Technic art of building," he regards as having nothing in common with Speaking, Writing, Painting, and Sculpture, "different modes in which men's thoughts can be communicated to other men, or perpetuated for the use of posterity;" and he considers that a really great change to which several causes conduced, was introduced into the practice of architecture at the time of the Reformation, namely, that "a Technic art came to be cultivated on the principles which belong only to one of the Phonetic class," subjecting art to the caprices and vagaries of intellect of the individual, instead of to the feeling of the age, and having the attendant "inconvenience that what a man learns in his life-time dies with him, and his successor has to begin at the beginning, and, following what may be a totally different track, their careers neither assist nor probably even cross each other." We have already in our former article, given expression to the view that the author's depreciation of the importance of individual influence is carried too far; we might have said something also about an apparent exaltation of the abilities of "men who could neither write nor draw," which might almost lead persons to think he would not be favourable to any education of architects; but we may say that the "inconvenience" which he speaks of, is one of the unfortunate circumstances in what we regard as the position of our art in this country, at the actual time. All the writing and talking, and machinery of societies, have succeeded in establishing a discursive and random firing at objects, but not an adequate system of registration and conservation of discoveries and acquired steps; whilst little of that cordiality exists between master and pupil, which was maintained elsewhere in some periods of art, which still is to be remarked in France, and which there is in the profession of civil engineering. Perceiving exceptions, however, we have hope of them.

But what else, we would ask, will be that future, hoped for even by Mr. Fergusson, but a combining of individual influence, and solidarity of the age, when all architects will be working within the same system or style, no matter which, though allowing scope to those individul efforts whereby have arisen the differences existing between works that are of the same age and locality? We shall have both, and we cannot spare either, of the sorts of influence: but, the truth is, they are not of the nature of things to be regarded as separate. Given the possibility of good architecture of the future; whatever the style or character be, is it not obvious that the art will be indebted in some slight degree to individuals,—for example, Pugin and Barry? Even a book may individually exert influence: and we are disposed to think in the face of the author of the one before us, that he himself will have helped to produce the very result. Moreover, we must not forget the *fact* of influence of individual architects in the early Classical and Mediæval periods. Greek architects have had their authorship recorded; and there are stories of the rivalry, as on the point of attaching a name to a work. William of Wykeham is almost as well known as Jones or Wren. But it seems to us scarcely possible to draw an accurate comparison between the circumstances of periods so different as were those which had and had not the advantage of printing to record the true facts.

There is in the volume, so much besides a narrative of the styles, so much in the form of observations to which the reader may respond, feeling that the matter was waiting to be said, and so much that arrests attention from its piquancy, if not correctness, that it is difficult to present a fair review of the work within ordinary limits. Designating the whole of the styles which preceded the Reformation as the "True Styles,"—those wherein we can reason with regard to buildings, "with the same certainty, and according to the same rules, which we apply when speaking of the works of Nature,"—and those, in whatever countries, subsequent to the same or a like epoch, as the "Copying" or "Imitative" Styles, wherein it would be "not too much to say that no perfectly truthful building has been erected in Europe," and the art has lost, besides intellectual value, all ethnographic signification, the author traces the chief features of ecclesiastical and secular architecture in Italy, Spain and Portugal, France, England, Germany; North-Western Europe, including Belgium, Holland, Denmark, Hamburgh, Sweden and Norway; India and Turkey, and some of the principal countries of North and South America. In the Introduction he recounts, and examines into, the proximate causes of the change that took place, as the revival of classical literature, the reformation in religion, and the development of the Italian school of painting. In the body of the work, further, he shows how such causes combining with circumstances of a people or locality, or operating after an interval of time, led to such varieties as the French and English forms of Renaissance and Revival. The division on Spain and Portugal, though written under difficulties which might be supposed, of gaining correct information, is a valuable portion of the work, giving not only information as to the succession of the three epochs which succeeded the Moorish and Gothic, the Plateresco, the Greco-Romano, and the Churrigueresque, but pointing attention to arrangements of plan, forms of steeples, effects of grouping, and many details which could be turned to account in modern English practice. In this and the other divisions of his work, he gives some attention to the subject of race as concerned in the varying intensity of the pursuit of art.

He sees, as others will if they attend to the subject, a remarkable difference between the Anglo-Saxon, Teutonic, Indo-Germanic or Aryan race, as he may choose to call our own, and the Celtic. He discovers in the race which has the work of colonizing and so peopling the globe, a temperament or an organization not favourable to the spread of art. He says in the Appendix, speaking of a possible success of the Aryan as result of education rather than feeling, and saying that such work fails to impress like real Art:—

> "This, probably, also is the true cause of the decline of architecture and other arts in Europe, and in the rest of the modern world. Wherever the Aryans appear, art flies before them; and where their influence extends, utilitarian practical common sense is assumed to be all that man should aim at. It may be so, but it is sad to think that beauty cannot be combined with sense."

The alliance of common sense and beauty, forming, however, as our author has shown, the art of architecture, and our branch of the race being not so much engrossed with the "true mission" of the Aryans, of pervading "the world with the useful and industrial arts," as to neglect poetry and painting, we have that expectation of an art, English and excellent, which Mr. Fergusson himself has, it seems to us, from time to time. No one can regard the particular fertility of taste which is French, and which, as we understand the theory of races, would be Celtic, without being struck with the fact that there are wanting to it just those "common-sense principles" which, by the aid of recent teaching and pursuits more than ever recognized and felt in England, this country could so easily offer in exchange for the element of art which it needs. In effect, there is in the horizon both for England and France, art that each country may grasp, if present relations continue, which will be the full denial to all such assertions as have been heard, that new and living art in architecture could never be seen again.

Notwithstanding that our author seems to underrate the imaginative element as exhibited in the *literature* of the Teutonic races, or not to observe that perfect art, like perfection in everything else, requires the special qualities of the Aryans, along with those of other races competent in imparting to it the essential of striking the attention at first sight, we recommend his Appendix, "Ethno-

* See p. 865, vol. xx.

logy from an Architectural Point of View," as one of the most interesting divisions of his book. We should be disposed to read it first. The author leaves indeed salient features of the difference as between the English and French in aptitude for art-work, unmentioned or unexplained. He alludes, however, to those differences which are observable in France itself; and we hope that he will pursue the interesting subject of the influence of race upon art, and be able to tell us why it is that there are the differences which strike the wonder of a traveller who studies the moving picture of human character, and which have their reflection in decorative form and colour, and that he will develope the field in what relates to savage races, and extend that which he has well commenced, the inquiry into the art-practice of civilized and colonizing nations under the new conditions which are presented by change of country and climate.

In the important division which we have mentioned, of Mr. Fergusson's work, after showing that archæology is of the same value to ethnology as palæontology is to geology, and putting aside all hypotheses of successive or simultaneous creations of mankind, he supposes that an original family, or tribe, in the highest state of civilization, and dwelling in the first seat of the human race, on becoming too large for resources of the country, sent off at successive periods, swarms or migrations, which hordes would degenerate, as there are innumerable proofs that man will, when exposed to want and misery, and that thus the world became divided amongst the Turanians, the Semites, the Celts, and the Aryans, the last being a Sanscrit-speaking race which went to India, and thence sent off the migration called Indo-Germanic.

The Turanians, supposed to have been at first hunters, would include the ancient Egyptians; the Chinese, ancient and modern, and the Japanese; the Mexicans, possibly; the Tamuls who once occupied all India; all tribes generally called Tartars, and all those now between India and China; the predecessors of the Semitic and Aryan races in Assyria; and amongst other races the Turks, who however, we may observe, are at present believers in one God, which characteristic Mr. Fergusson says is not generally Turanian. In Europe, are found the Magyars, Fins and Lapps, but overpowered by the more civilized Aryans; in Africa the Turanians have been almost as completely overpowered, by the Semites; whilst in America the same result has been produced by the Aryans.

The Semitic races, who were perhaps shepherds, migrated from the sources of the Tigris and Euphrates to the plains of Shinar, and reached Arabia, where now the tribes are nearly pure Semitic. The race included the Phœnicians and the Jews, and it is found in Africa; but the chief locality in which it developed itself was the country between the Tigris, the Mediterranean, and the Red Sea.

The next migrating horde, the Celts, who may be considered agriculturists, were not sufficiently distinct from the other races to have developed a form of nationality, polity, or religion, like the Semites. Mixing freely with those with whom they settled, they adopted manners and customs; yet they retained their principal characteristics. Their course was westward, to Europe, where they displaced the earlier Turanians. We first find them in Asia Minor. Thence, it is supposed, one portion of them passed by the northern coast of Africa to Gibraltar, and thence to Ireland. Another portion crossed the Bosphorus and ascended the Danube; and subsequently this branch was divided, part of those Celts entering Italy and getting to Rome, and the main portion going to Gaul and Belgium, and thence to Britain and Ireland. They are still going west.

The Aryan races having left their fatherland, crossed the Indus about 3101 B.C. More than a thousand years later they were penetrating to Ceylon. They gradually lost much of their purity of blood and faith; and in 300 B.C. they became Buddhists. Ten centuries after Christ, when the Moslems came to India, the religion of the earlier people, Turanians, had become supreme; and there was only a nominal thread of Aryanism showing the prior existence of a purer faith. They appeared in the western world in Greece, where by their union with the Turanian Pelasgi was formed the Greek civilization. In Rome they mixed with the Turanian Etruscans and the Celts. At last they reached Northern Europe, where they are at present. Whilst in India, they had sunk into the arms of a Turanian people; in Europe they found the country cleared of Turanians by the Celts. These last were improved by the mixture of new blood; but where the country was unoccupied, the Aryans have remained so pure that "they may perhaps regain something of the position they had temporarily abandoned, and something of that science which mankind only knew in their primeval seats."

Mr. Fergusson notes under separate sections of Religion, Government, Morals, Literature, Arts and Sciences, the characteristics which were those of the races. These features differed considerably; and those of architecture were variously affected by them.

The Turanians had no idea of a God external to the world: they worshipped trees, and a serpent, or a bull. From the reverence which they had for localities, pilgrimages originated. Government with Turanian races was a despotism. Having hieroglyphics rather than a regular alphabet, they had no poetry beyond lyrics, and have never advanced beyond the rudiments of a literature. The Chinese are in an advanced stage; but it appears that Mr. Fergusson does not regard them as having mastered even the elements of any scientific philosophy. The Semites have and always had, the distinguishing tenet of belief in one God. Their government was patriarchal. Having always had an alphabet, they possess one of the oldest literatures of the world, which with their creed has exerted influence over almost all the nations of the earth. Of the Celts our author writes, that in religion, none of the pure race "ever rose to a perfect conception of the unity of the Godhead," and that they have "a whole hierarchy of heavenly powers of various degrees, to whom the Celt turns with as confiding hope and as earnest prayer, as ever Turanian did to the Gods of his Pantheon;" that the Celt is the slave of a casteless priesthood; whilst that his temples are as splendid, and the formula of his ceremonials as unmeaning "as any that ever graced the banks of the Nile, or astonished the wanderer in the valleys of Thibet, or on the shores of the Eastern Ocean." As to Celtic government it is difficult to speak; the only form we know of is despotism, though not necessarily personal. The people are "too impatient to submit to the sacrifices and self-denial inherent in all attempts at self-government, and too excitable to be controlled, except by the will of the strongest, though it may also be the least scrupulous among them." A real aristocracy, and the restraints of caste, are impossible; "la carrière ouverte aux talens" is their boast; and the gratification of "individual ambition is consequently always preferred with them to the more sober benefit of the general advancement of the community." In morals, the Celts had lax ideas of the marriage-vow. "The ruling passion in the mind of the Celt is war," war not like that of the intolerant Semite, of extermination or of proselytism, but one "from pure 'gaieté de cœur' and love of glory. No Celt fears to die, if his death can gain fame, or add to the stock of his country's glory; nor in a private fight, does he fear death or care for pain, if he has had a chance of shooting through the heart, or at least wounding, his best friend at the same time." As to literature, nine-tenths of that of Europe which is lyric is of Celtic origin. "The Epos and the Drama may belong to the Aryan; but in the art of wedding music to immortal verse, and pouring forth a passionate utterance in few but beautiful words, the Celtic is only equalled by the Semitic race." The remainder of the literature is epigrammatic, but less sound and enduring than that of the Aryan.

The religion of the Aryans was the belief in one God, pervading everything that was made, in and beyond the universe. "A creed so etherial could not long remain the faith of the multitude, and we early find fire,—the most etherial of the elements,—looked to as an emblem of the Deity." But fire, with the earth and the heavens, were "reverenced because they were visible manifestations of a Being too abstract for an ordinary mind to grasp. Below this the Aryans never seem to have sunk." No temple or human ceremonial could be wanted with such a faith. "The most marked characteristic of the Aryans," says our author under another division of his subject, "is their innate passion for self-government." "The village system" which they "introduced into India is still the most remarkable of its institutions." Caste is another feature in these races. Where it is a living institution, our author speaks of it "as perhaps more conducive to the proper regulation of society than any with which we are acquainted." In the ratio in which a people is Aryan, they possess an aristocracy and municipal institutions, and are prepared to respect the gradations in society, and to sacrifice individual ambition. In literature, the possession of an alphabet more perfect than that of the Semitic races, and the structure of their language, enabled the Aryans to assume a position which the other races never attained to. History was not a mere record of dates; their poetry tended more to the didactic than the lyric; the Epos first rose to eminence, and the drama was elevated above a mere spectacle. When the blood of the Aryan has been mixed with that of other races, a literature eminently imaginative and poetic has been produced; but in proportion to their purity has been the tendency towards a more prosaic style. He says:—

"The aim of the race has always been the attainment of practical common sense, and the possession of this quality is their pride and boast, and justly so; but it is unfortunately antagonistic to the existence of an imaginative literature, and we must look to them more for eminence in works on history and philosophy than those which require imagination or creative power."

Of the four races thus described, the Turanian and the Celtic are regarded as all that are innately imbued with what brings the realization of great works of architectural art. Deficient as the first of these races was in the "phonetic modes of literary expression," as architects the Turanians were "unsurpassed,"—as shown, the author would seem to say, by the *dimensions* of their works in Egypt, Southern India, China, and Mexico, as well as by a degree of taste and skill, considering the civilization, which is remarkable as it is unexpected. In consequence of their gods having been kings, and being supposed to continue influencing destiny, temples were palaces on a large scale. More sacred however than their temples were the tombs.

"Wherever a Turanian race exists or existed, there their tombs remain; and from the Pyramids of Egypt to the mausoleum of Hyder Ali, the last Tartar king in India, they form the most remarkable series of monuments the world possesses; and all were built by people of Turanian race. No Semite and no Aryan ever built a tomb that could last a century, or was worthy to remain so long."

The Buddhist reform altered the funereal tumulus into a relic shrine; but the tope is still essentially a tomb. The Turanians also possessed, combined with wonderful appreciation of form, a passion for coloured decoration and an intuitive feeling for harmony of colours. They used throughout, the primitive colours, so as to be always brilliant, but never vulgar.

"From the first dawn of painting in Egypt to the last sign-board in Constantinople or Canton, it is always the same—the same brilliancy and harmony produced by the simplest means."

In sculpture, and indeed in painting regarded as the higher art, they were not so fortunate. Not having a literature, they felt obliged to attempt to make their sculpture express more than sculpture can. For the same reason the picture was to be all in all. But is the author sure the Egyptians had no literature? The story, in the picture, is told, he continues, with clearness that charms; its greatness however is less intellectual than the utterances of the other divisions of the human family.

There is this peculiarity about the Turanian arts, that they are instinctive rather than intellectual, and as shown by the works in Egypt and China, are incapable of "that progress which distinguishes most of the works of man."

The Turanians were to some extent astronomers; and in artificial irrigation they have always been singularly expert.

"Wherever you follow their traces, the existence of a tunnel is almost as certain an indication of their pre-existence as that of a tomb. It is amusing, as it is instructive, to see at this hour an Arab pasha breaking down in his attempts to restore the irrigation works of the old Pharaohs, or an English engineer officer blundering in his endeavours to copy the works instinctively performed by a Mogul, or a Spaniard trying to drain the lakes in Mexico."

Building and irrigation were "the special instincts" of the Turanians; and the perfection attained therein is the more singular, from contrast with what they did not do in other branches of art or science.

The Semitic races, Mr. Fergusson says, never erected a building worthy of the name. His assertion that "neither at Jerusalem, nor at Tyre or Sidon, nor at Carthage, is there any vestige of Semitic architectural art," and that the works never existed, however, requires some explanation. If he means that the numerous works of imitative art, *quasi* Egyptian, Greek, or Roman, that Mr. Franks has suggested to him may be Phœnician, are not true art,—that the Semitic races were in fact copyists,—we can understand him; though there is a particular character of masonry (*en bossage*) that is Phœnician, and that has been regarded as the original of *rustication*. As to Phœnician remains in general, we noticed in a recent volume the

researches, at Sidon, of M. Renan, for the French Government, and described the sarcophagus in the Louvre discovered at a previous date; and perhaps we may be tempted to return to the subject, for the sake of seeing what was discovered at Tyre, Jerusalem, and other places. We do not quite understand the remark, that Solomon had recourse to *Turanian* people to build his temple; for, Hiram was a Phœnician; and the Phœnicians, no less than the Jews, our author says, were Semitic. As we pointed out in our notice of the French researches, they deserve the attention of writers of Mr. Fergusson's calibre: we greatly suspect that though the bulk of the Phœnician art was imitative, there was something more, and that the whole of the works have more importance in the history of architecture, the art, than has been perceived. Taking the Semitic art, however, as all imitative of other art, we should instance it along with Egyptian works of the Ptolemies, as tending to controvert the notion,—though, may be, it is not that of our author,—that such unoriginal art is peculiar to the last three centuries.

The architecture in Assyria, of palaces of dynasties more or less Semitic, our author believes was unimportant prior to the time of Sennacherib, when the art was derived from the Egyptians. During the domination of the Romans, the temples of Baalbec and Palmyra were erected "without one trace of Semitic feeling or Semitic taste;" but they are beside the question, as being Roman works. Whatever there might be of architecture about the Jewish tombs, our author shows was subsequent in date to the Babylonish captivity or the Roman influence; neither the Turanian idolatry, nor any special reverence for the dead, being consistent with the Jewish feelings and religion. Painting and sculpture were forbidden. Music was the one æsthetic art of the Semitic races.

"The true glory of the Celt in Europe," says Mr. Fergusson, "is his artistic eminence."

"It is perhaps not too much to assert that without this intervention we should not have possessed in modern times a church worthy of admiration, or a picture or a statue we could look at without shame.

"In their arts, too,—either from their higher status, or from their admixture with Aryans,—we escape the inistinctive fixity which makes the arts of the pure Turanian as unprogressive as the works of birds or of beavers. Restless intellectural progress characterizes everything they perform; and had their arts not been nipped in the bud by circumstances over which they had no control, we might have seen something that would have shamed even Greece, and wholly eclipsed the arts of Rome."

Without the instinctive knowledge of colour of the Turanian, and without having been able to give to music that intellectual culture elaborated by the Aryans, the Celts are far better musicians than the former, and far better colourists than the last-named races. But,—

. . . "in modern Europe. Architecture is practically their own. Where their influence was strongest, there architecture was most perfect; as they died out, or as the Aryan influence prevailed, the art first languished, and then died."

Temples were required by their "quasi-Turanian theology," almost as grand as those of the Copts or Tamuls; whilst even more remarkable were their tombs, which were such as a Turanian might have envied, not for size, but for art; and "even now" they can "adorn their cemeteries with monuments which are not ridiculous." The Celts are mixed with other races; but it is thought that,—

. . . "where no Celtic blood existed there no real art is found; though it is perhaps equally true to assert that not only Architecture, but Painting and Sculpture have been patronized, and have flourished in the exact ratio in which Celtic blood is found prevailing in any people in Europe; and have died out as Aryan influence prevails, in spite of their methodical efforts to indoctrinate themselves with what must be the spontaneous impulse of genius, if it is to be of any value."

In the future of science, "it is doubtful whether the deductive brilliancy of the Celtic mind can avail anything against the inductive sobriety of the Aryan."

As to the Aryans, we understand our author to say, their practical common-sense aim is antagonistic to imaginative literature, and is more than doubly so to the Fine Arts. We have already suggested that there may be some difference of opinion on this point. Our feeling is that the assertion is not accordant with what is elsewhere said of what goes to form good architecture. We must also dissent from a following *dictum*, put forward as an explanation of another assertion, that a people possessing great "power of phonetic utterance," never could look upon picture or statue as more than subsidiary illustration of written text. A painting may represent what took place at one moment of time; but also, it can show what it is scarcely possible for the best written description to afford. Architects know this; or there is no need of plans and working-drawings. With architecture, the case of the Aryan is so bad, Mr. Fergusson says, that "had there been no Pelasgi in Greece, there probably would have been no architecture of the Grecian period." Convenience is the first thing which the Aryan seeks, and by the readiest means, and "why should he do more?" If out of emulation he is induced to ornament, he is willing to copy what has proved successful, to spend money, and to submit to some inconvenience; but "in his heart he thinks it useless, and he neither will waste his time in thinking on the subject, nor apply those energies of his mind to its elaboration, without which nothing great or good was ever done in Art." As to faith in ceremonial worship, he,—

. . . "can never be brought to understand that prayer is either more sincere or more acceptable in one form of house than in any other. He does not feel that virtue can be increased or vice exterminated by the number of bricks or stones that may be heaped on one another, or the form in which they may be placed; nor will his conception of the Deity admit of supposing that He can be propitiated by palaces or halls erected in honour of Him, or that a building in the Middle Pointed Gothic is more acceptable than one in the Classic or any other style."

The want of faith "may be reasonable," our author adds, "but it is fatal to poetry in art."

Moreover, the Aryan is deficient in appreciation of colours; though, even savage races cannot go wrong in this respect. As before noted, if the Aryan be exceptionally successful in art, education, not feeling, is, according to Mr. Fergusson, the cause. The ancient Aryans, in marked contrast with the Turanians, never erected a building in India; and we do not know what their style was or is.

Though wherever *such* "Aryans" appear, it may be that "Art flies before them," and "utilitarian practical common sense is assumed to be all that man should aim at," *we* do not think "that beauty cannot be combined with sense." We have no belief that it is necessarily uncombinable. Our poetic literature, appreciated by all who understand our language, would show otherwise. Even if the task be hard to the Aryan race, is it so to the "true-born Englishman," Celt, Roman, Teuton, Dane, Norman, and French? That product of this mingled blood is not a "sober, reasoning, unimaginative and unartistic people," like "the Aryans of the Vedas or of Tacitus." The "literature eminently imaginative and poetic," that has come of the mixture of races, discloses the existence of a fund of originative power which, hitherto manifested in a rythmic medium, whilst equally a prime mover in those arts with which the "Aryan" is "pervading the world," is of the nature to grasp the beautiful as the useful, and will probably permit of, and conduce to, the art architecture, the more that the Aryan can appreciate "the beauty of scientific truth."

NEW MATERIALS FOR THE LIFE OF SIR FRANCIS CHANTREY.

THE two greatest bust sculptors England has produced have each had their Lives or Recollections of their Lives written by one of their executors. The story of Joseph Nollekens is told by "an ungentle executor," John Thomas Smith, and he has carried into every page of it the resentment of great expectations, not deferred alone, but entirely disappointed. The story of Francis Chantrey has been written (or attempted to be written) by George Jones, esq., R.A., a very gentle and in no way disappointed executor. The parallel between Mr. Smith and Mr. Jones may be soon summed up: Smith is all scandal, Jones all panegyric. Smith finds vinegar and gall from his legacy of one hundred pounds, Jones honey and fine words from his legacy of two thousand pounds.

It is much to be regretted, many have been heard to remark, that the author of the Lives of the most Eminent British sculptors did not survive to write the life of one of the greatest of our sculptors. Allan Cunningham should have been spared to write the Life of Francis Chantrey. He was not. Nor do I believe that he would have written it. Why? it will be asked. He who knew so much of the man—was in his service, and with him daily for the last thirty years of his life, and a practised writer of Lives! Why not? Was there aught to conceal in Chantrey's career? aught to varnish? I believe not. Did the man know too much of the master? or did he care too little about him? That my father would *not* have written the Life of Chantrey I have heard him more than once declare. There were many to please, and some to offend:—

"Last night her lord was all that's good and great,
A knave this morning, and his will a cheat:"

for thus by turns lamented and roared Sarah Jennings, Duchess of Marlborough, wife of John Churchill, the great Duke of Marlborough. Little spiteful wasp of Twickenham, you stung the heart of your Atossa, of all time, in that condensed and withering couplet.

In the church of Walton-upon-Thames (where Roubiliac's fine monument of Boyle, Viscount Shannon, is enshrined), is a figure by Chantrey of a female weeping, erected in memory of Christopher D'Oyly, esq., barrister, who died in 1795, and his widow, Sarah, grand-daughter of Sir Hans Sloane, who died in 1821, in the ninety-seventh year of her age. This Mrs. D'Oyly lived, when in London, at No. 24, Curzon-street, May-fair: she was nurtured in good style in her youth, saw company to the last, and died rich. In her will she remembered a Mr. Daniel Wale, an old and faithful servant. Mr. Wale had a daughter, Mary, calling Chantrey cousin, and to this cousin, with her little portion, our young and struggling sculptor was married, in 1809, in the church of Twickenham-upon-Thames.

My father was fond of relating two anecdotes of Chantrey, when young and unknown, that materially helped the young sculptor on the road to fame. They relate to two very peculiar characters,—Nollekens, the sculptor, and Lord Mayor Sir William Curtis. When, in 1811, Chantrey sent his bust of Horne Tooke to Somerset House, Nollekens viewed it earnestly, lifted it from the floor, set it before him, moved his head to and fro, and having satisfied himself of its excellence, turned round to those who were arranging the works for exhibition, and said, "There's a fine, a very fine *busto*; let the man who made it be known—remove one of my busts, and put this in its place, for it well deserves it."

The other relates to the same year, when he became the successful candidate for the Guildhall statue of King George III. When the design was approved, and his name made known, it was objected that he was a painter, not a sculptor. "You hear this, young man," said Sir William, with a turtle and champagne accent, "what say you—are you a painter or a sculptor?" "I *live* by sculpture," was the reply; and, short and Chantrey like, it was enough. London thus obtained a fine statue at once easy, characteristic, and dignified.

Chantrey, some five years later, modelled a bust of Curtis. He has caught the man,—shrewd, humorous, voluptuous, liberal, and yet mean,—the lips redolent (though in marble) of turtle and discount.

Chantrey was a poor correspondent, though his letters in the way of business are numerous enough and to the point. His longest letter to my father is from Italy. The readers of the *Builder* will like to hear what so keen a reader of mankind, and so quick an observer of nature, has to say. He was travelling with Jackson, the celebrated portrait painter:—

To Allan Cunningham, Esq.

"Rome, 18th October, 1819.

"Dear Sir,—Our journey hitherto has been very pleasant and very fortunate. We ran through France with all possible haste. We passed the Simplon in eleven hours. The road is in every part 21 feet wide, and equal to the best of our English roads. It is *perfectly safe*, though for many miles it is cut in the sides of almost perpendicular rocks of granite, at a fearful height from the bottom. Milan was the first place that presented anything important in art. Verona and Padua are interesting, but to me unimportant. The first contains the most perfect amphitheatre in Italy, and the latter much of Palladio's architecture. Venice was the place that first excited my surprise and raised my admiration. It abounds with the very finest works of art,—works, unfortunately, in fresco. Bologna and Florence, also, contain endless treasures; but Rome, above all, is the most important. My mind is so confused with the rapid succession of interesting objects, that I am not yet sufficiently settled to take advantage of anything. Canova is the great modern master here, and deservedly so. He is excelling in simplicity and grace every day.

F. CHANTREY."

In my paper upon Soane,* I gave a characteristic note from Chantrey to the original Paul Pry. A *notelet* or two from Chantrey to his

* See *Builder*, p. 743, vol. xx.

"friend and assistant," will be found equally characteristic:—

To Mr. Cunningham.

"Westminster Abbey, 3 o'clock.

Examine the bearer, Affleck. If you think him in a state fit to serve me, keep him; if not, discharge him. F. CHANTREY."

Affleck was a Dumfries mason, who found his way to Pimlico, and obtained employment under Chantrey through Allan's influence. He was an able mason, but

"Fonder of purl and skittle-grounds than *work*,"

took kindlier to the neighbouring "Crown and Anchor" than he did to the mason's banker. My father looked at Affleck, turned and looked, hinted regret at what he saw, and had seen, and sheltered before; paid him his wages (with something for his own pocket at the same time), and dismissed him. Affleck—I remember him well—never again served Francis Chantrey. He had a touch or two of pawky Scottish humour about him, not unwelcome to my father.

A second *notelet* is additionally valuable for its answer. It is brief and to the point:—

To Mr. Cunningham.

"Holkham, Monday.

Dear Sir,—D—n John for sending me away without my telescope, and find Foster's letter.

F. C."

At the bottom of this my father has written "Copy of Answer:"—

To Francis Chantrey, esq.

"Belgrave-place, Tuesday.

Dear Sir,—I've d—d John, and found Foster's letter. A. C."

John was Chantrey's butler, and a very good fellow and excellent servant, but John "unhappily thought fit" (dear Mat. Prior) to publish his love of drink to the bulk of Chantrey's visitors. Old Mr. Robinson, who had been Sir Joshua's fishmonger, and was then Chantrey's neighbour (a kindlier hearted man I never met with), called to inquire for Chantrey, who had been unwell. John was in his cups when he answered the door. "Who! who! shall I say—I say—called?" hiccupped John, full in the face of the retired fishmonger. "Mr. Robinson," was the reply. "What!" said John, effervescing with real drink and imaginary delight, "what!" (peering closer into his eyes), "what, old Robinson Crusoe. Give us your hand. How's Friday?" and H. Robinson, esq., of 14, Upper Belgrave-place, Pimlico, "fishmonger," not of "York, mariner," had a grip from John the butler that brought tears of laughter and pain into the eyes of the old gentleman. My father dearly loved to relate this story; Chantrey was delighted with it; Robinson himself told it my father, rather seriously at first, but very good-humouredly withal. "He that is drunk is as great as a king," as the Alderman of London hiccupped at Guildhall to that merry monarch King Charles II.

"Who has e'er been to Paris,"—no, to Holkham, in Norfolk, must have seen and will remember the *two* woodcocks cut with so much delicacy in marble by our great sculptor. Chantrey, proud of his achievement (he had killed at Holkham two woodcocks at one shot in what is called a shy season), commemorated the event in marble. The following verses record the circumstance:—

"The snowy hills of Norway bred us,
The silver springs of Holkham fed us:
A sculptor, as we wing'd our way,
Held out his gun and made us gay;
But, sorrowing for us as we fell,
To marble turn'd us by a spell.
Princes and peers flocked in a bevy,
And said, 'How glorious done in gravy!'
Geologists* looked marvelling on,
But feeling cried, 'By God, a stone!'
How blest our fate o'er men and mice,
Heaven made us once, and Chantrey twice!"

These verses, I may now announce, were written, that is, thrown off "at a heat," by Allan Cunningham.

Of the man Chantrey I wrote (anonymously) the following description soon after his death. When I add that it contains a few touches by my father, it will be liked all the better:—

"Sir Francis Chantrey was about 5 feet 7 inches high, of a stout make, and one of the most active and vigorous men of his time, but latterly inclined to corpulency. His head and face were very fine, his mouth exquisitely chiselled,—Lord Byron's not finer nor more expressive. His eyes round and lustrous,—one useless for vision, but in no way apparently different from its fellow. He had been bald from an early age. His voice was agreeable, his conversation humorous and sarcastic by turns, and always animated. He had mixed much with the world, and, unlike the Hermit of Parnell, knew it better by experience than by books. He had been much of a reader in his youth, and had that happy and rare art of learning from conversation what others seek and acquire in books and silent study. His knowledge was, therefore, very general, and there was scarce a topic at table but what he could speak, and very ably, upon. His reputation, his manner, and matter, always commanded attention. Then how delightful were his dinner parties, not for the viands only, though they were always of the choicest description, but for his own sake; for he talked much, and made a stranger's diffidence rub off by touching on subjects he knew would be agreeable to him. Then, too, his conversation was not addressed to one or two on his immediate right or left, but was aimed at the whole company. Dr. Johnson would have loved his table, and would have been reminded of the dinners he enjoyed so much at Sir Joshua's and Allan Ramsay's."

I have something more to say of the great sculptor. PETER CUNNINGHAM.

* Chantrey's great friends, Professors Buckland and Sedgwick.

AMERICAN HOTELS.

"THE LINDEL," OF ST. LOUIS.

THE following more precise account of one of the large hotels in America, to which we briefly referred lately, will be read with interest:—

During my visit to London I have seen in the *Builder* a notice of a new hotel at St. Louis, of which I was the architect and superintendent. Believing you anxious to lay before your readers all the building news both of the Old and New Worlds, a detailed description of it may prove interesting, from the fact of its being the largest and said to be the most complete either in Europe or America.

Before giving the details of its construction, a brief comparison with some of the other extensive hotels of the United States will show its magnitude. For the last twenty years the Astor House of New York, a plain but substantial building of grey granite, costing 360,000 dollars, has been *the* hotel, when size alone was taken into account. The St. Charles, at New Orleans; the "Virginia" and "Planters," of St. Louis; and the "Burnet," at Cincinnati—the latter containing some 260 rooms, and being in some respects the queen of hotels—have for fifteen or more years been among the larger hotels of the union. For the last ten years these have been excelled in the north-west by the Tremont of Chicago, which in its turn is being eclipsed by the new Sherman of the same city; which is 181 feet in front by 120 feet deep, and has six stories in front and seven in the rear, over side walk; its cost being over 400,000 dollars. There have been many excellent houses of larger capacity, and fine specimens of architectural taste, but of less pretensions, as the New-hall at Milwaukee, the Gayosa at Memphis, the Richmond at Caicago, Barnum's in Baltimore and in St. Louis, &c. The large Metropolitan of New York overtopped the Astor; and the St. Nicholas and Fifth Avenue, of later date, surpassed this in dimensions and modern improvements. These again were all cast in the shade by the magnificent Continental of Philadelphia, which, until the Lindel of St. Louis was erected, was certainly not excelled in America. The Continental is six stories in height, exclusive of basement, and presents a front of 235 feet by a depth of 194 feet. Its grand dining-room is 90 feet by 47 feet; its tea-room, 65 feet by 36 feet. Its capacity is for 800 to 900 guests.

But extensive as is the Continental, the Lindel largely excels it, being seven stories high exclusive of basement. Its height from side walk to top of eave cornice is 112 feet: its south front is 272 feet; its depth, 227 feet. The east and south fronts are faced with cream coloured magnesian limestone, elaborately finished. The north and west fronts are faced with the finest stock brick, with cut stone ornamental window trimmings. The two dining-rooms (with carving-room between), easily thrown together for dancing or other purposes, are 233 feet in length by 45 feet in width, evidently the largest in the world: that part used as the gentlemen's ordinary is alone 128 feet long by 45 feet. On the same floor, and contiguous, is a kitchen 60 feet by 48 feet, and 20 feet high.

This hotel can accommodate with ease 1,200 persons. Some idea may be formed of its great extent by a few statistics of materials used in its construction. The brick laid in the walls would be sufficient to pave an area of more than 38 acres. This is in addition to 8,000 perches of rubble masonry in the foundations, 35,000 cubic feet of cut stone in the fronts, 740 tons of cast and wrought iron, 27 acres of plastering, 810 windows, 650 inside doors, 3,240 lb. of copper for gutters: the plate glass in the building would cover an acre of ground, the floors seven acres: the skirtings, or washboards, laid in a continuous line, would reach thirteen miles; and if a boarder desires to take a walk through the wide and lofty corridors before breakfast, he may travel one mile and a quarter without going over the same floor twice. Besides the marble flooring and other flagging, 300,000 feet of flooring boards have been laid, and it will require 30,000 yards of carpet to cover them. Thirty-two tons of sash-weights are used, 16,000 feet of gas-pipe (with many thousand burners), 120,000 lb. of lead, and 30,000 of iron pipe to supply it with water, besides 37,700 feet of steam pipe for heating it. Thirty-two miles of bell wire were required, and three water-tanks containing 30,000 gallons of water rest upon its roof. The actual cost of the building is 950,000 dollars, which, with the ground, valued at 326,400 dollars, makes the whole value 1,276,400 dollars, without the furniture. There are 525 bed-rooms, 19 parlours and club-rooms, and 36 shops and basements.

Style of Architecture and Plan.

The design is Italian, of the Venetian school, and the building is substantial in the extreme, being built with brick, stone, and iron. The hotel consists of two parallel buildings, extending east and west the length of the whole front, with a space of 45 feet between them, and connected only in the centre, and both extremes, by wing buildings running north and south, and leaving between them two courts, one of which is used for a gentlemen's recreation, and the other for a ladies' conservatory. While the centre connecting building, and the eastern flank extend to the full depth of the lot, the space that would be occupied by the western flank has been reserved for the erection of a theatre, to connect with the building. The principal or southern front is divided into five compartments, on its base line, the centre and both extreme divisions forming projections, and the two receding divisions forming on the first and second stories colonnades between them, thereby producing a very pleasing effect. The three principal elevations on the ground-floor are supported by columns, imposts, and arches, the shafts having every alternate course lightly vermiculated, and forming a continuous arcade around the three fronts, imparting strength to the building, and obtaining sufficient light for the shops and basements: the pedestals of these columns extend down to the basement floor, and are supported by inverted arches: the elevations are sufficiently marked by continuous cornices and string courses, dividing each story, together with the variety of pitched and compassed pediments, columns, pilasters, and transes, around the windows, and its handsome crowning entablature.

The basement extends under the entire building, courts, and side walks, and is arranged in the following manner:—The laundry has five rooms for washing, drying, mangling, ironing, and general linen room: the latter connects with steam elevators, with the distributing-rooms on each story. The baker and pastrycook have each two rooms, and two ovens, with a general flour-room between them. The butcher and fishmonger have one large room each, with refrigerators: the grocer and greengrocer have one room each: the wine-cellars are six in number, and convenient to the ice-vaults. The coal-vaults are six in number, and connect with a steam elevator: the ash-vaults are spacious, and are the termini for all the ash-flues of the building. The steam-boilers and engine-rooms are outside the building: the latter is so situate that the shafting passes directly through the laundry. There are also two well-lighted and ventilated dining-rooms for the servants of the house and those of the guests, and a large saloon 93 feet by 64 feet, under the office and vestibule, with outside and inside entrances, to be used as a general bath-room, handsomely fitted up.

The drainage is very complete, and all the water from the inside and outside of the building passes through glazed earthenware pipes, having all the hot and cold water connexions near the extreme end from the main sewer, so as to insure a continuous current, together with all the surplus steam and hot water from the boilers passing into them, and preventing them from freezing in winter. The force-pumps can also be applied for washing them out when required. The conducting flues for the offal and waste water terminate over the traps on iron gratings, allowing the

fluids to escape while the solids remain to be removed through outlets inclosed by iron doors. A railway is constructed through the main passages for the conveyance of supplies to and from the different apartments, each of which is well ventilated and fitted up to suit the various purposes.

There are four principal entrances to the building besides a carriage entrance. The principal or grand entrance is on the south front, and is covered by a very elaborate two-storied portico, with a projection of 8 feet. The vestibule of this entrance is 93 feet by 64 feet wide, and has a variegated marble floor, with inside columns supporting enriched arches and cornices, and having the walls and ceiling decorated by fresco painting. The ladies' carriage entrance is on the east side, and is so arranged that guests can alight under cover, the carriage then being driven through the hotel, and leaves by the north side. In the courts in the eastern and western parts of the ground-floor are separate colonnades for ladies and gentlemen, fitted up with fountains, evergreens, &c. Also on this floor is the richly-decorated saloon, 60 feet by 46 feet; billiard-room 62 feet by 42 feet; public and private offices, freight-room, coat and wash rooms, waterclosets, and a large fire-proof vault. The walls and ceilings of these rooms are painted and panelled, and the halls, billiard and refreshment saloons highly decorated by frescoes.

There are no columns in any of the large rooms in the building, the floors being supported by wrought-iron boxed girders, 48 feet long, 30 inches deep, and 9 inches wide, with 7-inch joists, and brick arches between them. Encircling the public offices and these four entrances are the thirty-six shops, communicating with the interior of the house, with a walk or platform all around the rear doors, and designed to suit the requirements and convenience of its guests. On the first floor also, to the right and left of the main entrance, are two grand staircases, commencing in the basement and running up the entire height of the building. The steps are each 12 feet long, and the walls wainscotted with black walnut, handsomely panelled and moulded, having gorgeous mirrors on the landings.

The first story contains the ladies' public and private parlours, reading and writing room, antechambers, receptions, &c.; also gentlemen's public and private parlours, writing and conversation rooms, club and reading rooms; all spacious, lofty, and finished magnificently. The latter, in the centre of the building, is surmounted by a large stained-glass skylight, and separated from the courts on either side by glass partitions. The gentlemen's public reception-room is in front over the main entrance, and is 35 feet by 25 feet. The gentlemen's, ladies', and children's dining-rooms are on this floor, and the carving-room located between the ladies' and gentlemen's, and are all wainscotted in the richest manner, with frescoed walls and ceilings, which are filled with allegorical representations, and the walls to the height of 13 feet between the windows are empanelled with gorgeous mirrors. These mirrors are all supported by appropriate statuary. Attached to the carving-room is a large fireproof vault for silver ware, and commodious china and delf closets, steam plate-warmers, tables, &c.

Behind and attached to these dining-rooms on the same floor, but running back northwardly, is the culinary department, including all their attendant and multifarious requirements. The kitchen, 60 feet by 46 feet, and 20 feet high, is one of the best lighted and largest in the United States, and is entirely fire-proof, with a stone floor. The apartments for roasting, broiling, frying, stewing, boiling of meats and vegetables, &c., are in the centre, allowing passages all around them. A hood covers the whole, of sheet-iron, which terminates with a large flue, to carry off all smoke and effluvia from cooking into the main shaft from the steam-boilers. And yet with all these rooms, there is a fine promenade on this floor, between the parlours and reading-rooms.

The second, third, fourth, fifth, and sixth stories are divided into bedrooms and suites of rooms for families, containing two to six rooms as desired. The house is not cut up into small apartments, like some, though there are 525 bedrooms in the hotel (and not a dark one among them), ranging in size from 13 by 16 feet, to 31 by 25 feet, connected by spacious corridors 12 feet wide, by 16 to 20 feet high. These corridors, straight, and extending almost as far as the eye can reach, with triple windows (nearly the width of the halls) at their extremities, give good ventilation; aided by twenty patent ventilators through the roof.

The whole of the large rooms and halls are warmed by hot water and steam; also fire-places and gas throughout the entire building; each room in the hotel having a white marble mantel-piece, and the floors of the first and second story corridors, and of the bar, billiard-room, and office being flagged with black and white American marble. These are in addition to the marble wash-basins, toilet-stands, &c. Besides the quantity of lead and iron pipe in the building, there are six main lead pipes 3 inches in diameter. The water-closets will number 175. In fourteen sets of rooms are baths of planished copper, with silver-plated furniture, equal to any in the first-class dwelling-houses; wash-basins with handsome counter-sunk marble tops, highly finished; and each of these, with 96 other wash-stands, furnished with a constant supply of hot and cold water for every guest. All the water is filtered through Rice's patent filterers.

As protection against fire, there are, in various parts of the house (four in each story) twenty-six openings or fire-plugs, with three coils of hose-pipe. All these conveniences are fed with water from three large tanks on the top of the building; the water of which is forced there by the engine of the house. The pumps being connected with the city reservoir, can all the time force water over the building.

The telegraph, bells, and speaking tubes, will communicate from the office (which is in the vestibule of the principal entrance) to all parts of the house.

The building is heated by coils of pipe, 1 inch and 1¼ inch in diameter, each coil being inclosed by very handsomely-perforated brass screens, and placed under the windows, forming the panelled backs, with reflectors behind them; under the tables having marble or mosaic tops, in the floors of the halls, and the panels of the pilasters.

All the hot and cold water supplies are from the tanks under the roof of the building, and the pipes for both hot and cold are inclosed in wooden boxes, flush with the walls, and placed behind the base of the rooms, making them easy of access; while the hot water keeps the cold from freezing in the winter season, the steam from the boilers heats the water in the tank, and the hot water, after circulating through the pipes, returns to the boilers.

In conclusion, I will add that nothing has been omitted which might contribute to the comfort of the guests, and the successful working of the house. Having a choice of four fronts, the south was selected, for the reason that the summer winds blow chiefly from that quarter, and, circulating through the building, carry away all effluvia from the kitchen and objectionable parts of the building, which are placed most northwardly. The office, being placed at the extreme end of the vestibule, and between the two courts, commands a full view of all the entrances. The chief steward, from his position in the principal carving-room, has also a full view of all persons in the dining-room, as well as his little army of waiters, and has all supplies under his immediate control. In case of an alarm of fire, the inmates would not only have the advantage of seven large staircases, passenger and other elevators, and five entrances, but also the shops, which connect with the interior of the building, by which to escape.

THOMAS WALSH.

LONDON BELLS.

IT is curious to note the number of bells that on Sundays and Saints' days summon the multitude to the various places of worship; that on high days and holidays clang from the steeples; and, as hour after hour slips by, chime the note of departing time. There are also bells connected with railway stations, hospitals, almshouses, and manufactories, which mingle their tones in the great voice of London. In the old time, before the population had become so dense as it is and the traffic so immense, the city bells must have tolled with far greater effect than they do at present, when, owing to the din, it is seldom that the great bell of St. Paul's can be heard in either Cheapside or Fleet-street. If the bells of Bow were ringing a full peal, they would not, during the busy time of the day, be heard in the bustling thoroughfare at any distance. In quiet nooks further removed to some extent from the traffic, the neighbouring church-bells can be plainly heard.

When we remember the beautiful chimes of some of our ancient cathedrals and churches, the sweet and musical notes which come from the steeples of rural churches, and compare them with the sounds of more modern bells, the contrast is greatly in favour of the former.

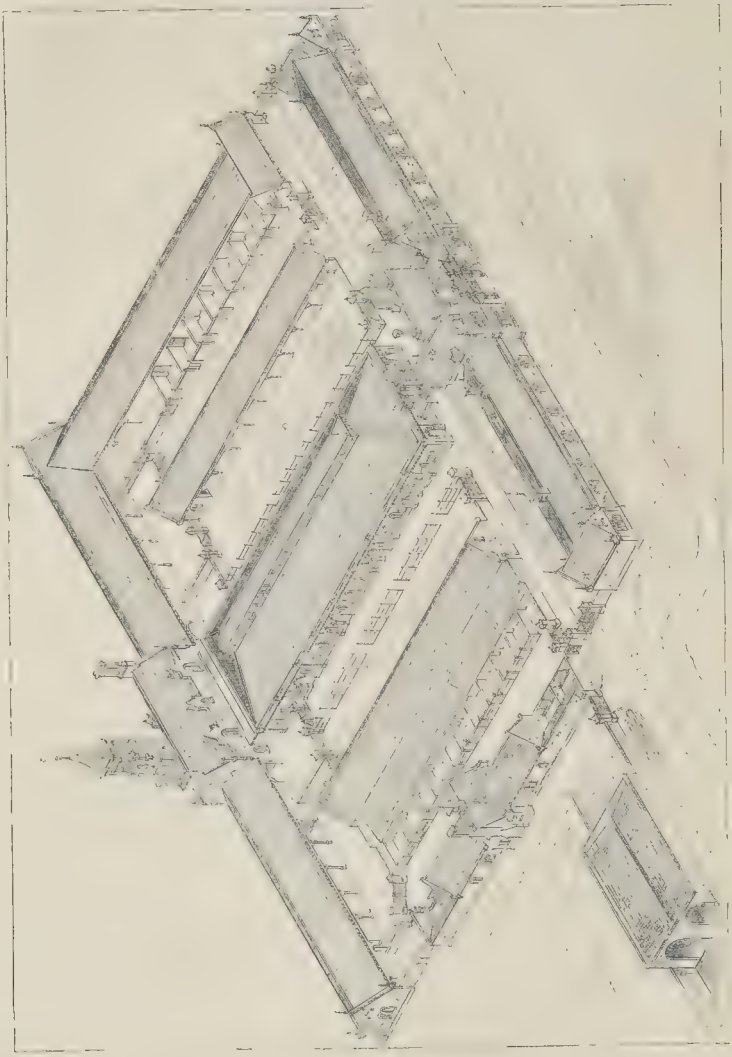
There are certain bells still remaining in London, notwithstanding the Great Fire, which have historical notes. That, for instance, at the top of the Bell Tower which adjoins the governor's lodgings in the Tower, which was probably tolled at the execution of Lady Jane Grey, Anne Boleyn, and other state prisoners, and probably sounded alarms of fire and other calamities in early days. This bell seems to have been more particularly used by the Tower authorities than that in St. Peter's Church, which stands near the spot where the scaffold was usually erected. The bells of St. Bartholomew's, Smithfield, are old, and were probably rung when the court has come to the tournaments and jousting at Smithfield. With the exception of Westminster Abbey, St. Saviour's, All Hallows, Barking, Cripplegate, and Old St. Pancras, there are few of the ancient bell-towers of the metropolis remaining. Several of the bells, however, may have been saved from the ruins of the fire. There is also the bell of the Charter House, which has tolled at the departure of a brother from soon after the death of Sir Thomas Sutton. Many will still remember that, while the fire of the second Royal Exchange was raging, the self-acting bells played merrily the tune of "There is nae luck about the house," and eventually fell with a crash amidst the blazing ruins.

Those who live near the Regent's Canal, particularly in one part, have at times the opportunity of hearing many bells, for the water acts as a conductor of sound. While listening to these bells striking the hour and chiming the quarters, it is curious to notice the varied way in which the work is done. One is exceedingly slow, and in Johnsonian notes takes a long time to tell the hour of twelve. Another, also slow, although it commences loudly, falls off towards the end, so as to be scarcely audible. Some clocks fail in the same way in the middle of the long hours. One clock is impatient, and in a tinny tinkle strikes twelve before the others can complete two. This quick bell does not chime the quarters, but at each half-hour gives a sharp sound. Nor are the tones of the bells less varied: some are sweet and silvery, and float like pleasant music on the breeze: others are hoarse and heavy; and some have a cracked and miserable note. The effect of the atmosphere in the conveyance of sound is very remarkable. Sometimes for a week or more at a time not even those bells which are nearest can be heard. Then occurs a sudden change, and a multitude of sounds come from Citywards; or, as the wind may set, from other quarters. Although the Great Northern railway line passes at a distance of less than a quarter of a mile from the spot where this is written, at times not the least sound from it can be heard. At other times in the night, the signals and the puffing of the locomotives are heard from a long distance, as though blown close to the windows.

The compression of a heavy atmosphere, in towns, which envelopes all, and prevents the diffusion of sounds, is worthy of study; for, when the air is thus loaded, the evil emanations of ill drained spots are concentrated, and assume a more deadly character.

Great as is the number of bells in the metropolitan districts, they fail to produce the same amount of effect as in some provincial towns where a lingering relic of the curfew may be heard from the churches at morning and evening, where the passing bell is still tolled on the death of an inhabitant; and on special occasions rattling peals, stirring the memory and the feelings, may be heard by every one in the place. Let us end with two inquiries;—what is to be done with Big Ben? and are our bellfounders now-a-days as clever as they ought to be?

MEETINGS OF ARCHITECTURAL SOCIETIES.



Edinburgh Architectural Association.—At the last meeting of this society,—Mr. R. Thornton Shiells, the president, in the chair,—Mr. Connell read a paper on "Ventilation, and its Influence on Health." On the paper having been read, Mr. Brown made a few remarks on the subject of which it treated, and the meeting separated with a vote of thanks to the chairman.

Liverpool Architectural Society.—The eighth meeting of the session of this society was held on Wednesday evening, the 28th ult., at the Royal Institution, Colquitt-street, Mr. W. Wrightman, president, in the chair. After the transaction of business, Mr. W. H. Picton read a paper, "Notes on Rome and her Edifices."

THE PRINCE CONSORT'S FARMS.

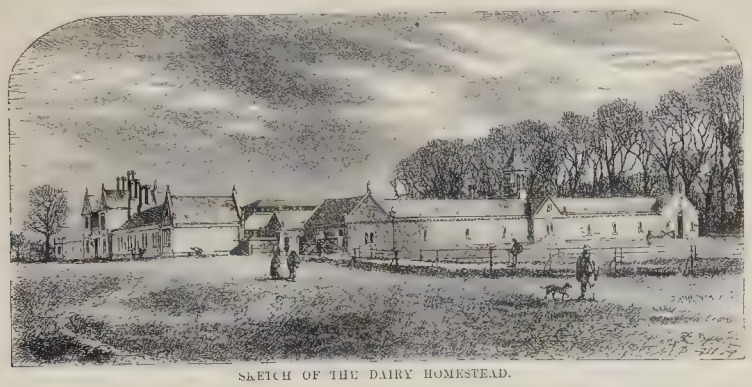
The recently published account of "The Prince Consort's Farms" is a book honourable to all parties concerned.* Its appearance is inviting; and the manner in which Mr. J. C. Morton has collected and arranged the materials is creditable alike to his knowledge and discretion. If he is a benefactor "who makes two ears of corn grow where only one grew before," how much so was the good Prince, who reclaimed or improved many hundred acres, and thus added a vast breadth of land to the "permanent staple" of the country; while by his example and successful investigations he assisted in leading to the general adoption of such improvements in farming as tend to increase greatly the produce of any given quantity of land. Our agricultural contemporaries will doubtless do full justice to the technical branch of the subject: to them it will afford many texts; for, as is correctly stated, his Royal Highness "stood, we believe, alone in British agriculture, as in himself the exemplar and exponent of a greater diversity of farm practice and experience than any other agriculturist." The book is in four chapters, headed, "The Royal Estates;" "The Prince Consort's Farms;" "The Prince and the Labourer;" and "Biographical;" with an appendix, giving a list of coniferous trees at Osborne and Barton, and list of animals exhibited and prizes won by the Prince. It is fully illustrated with sketches, isometrical views, maps, and plans, including engravings of many, if not all, of the cottages erected for labourers and others.

In the description of Osborne an account is

ISOMETRICAL VIEW OF THE PRINCE CONSORT'S DAIRY HOMESTEAD.

given of one of the Prince's contributions to the solution of the sewage question, formed as a remedy to the nuisance once caused by taking the drains to the shore for an outlet. We described at the time what was done, but may usefully quote the more complete description now given:—

"The original idea contemplated such a filtration of the sewage as should retain in compost with earth all the solid and most of the fertilizing ingredients of the liquid portion, letting the bulk of the water thus treated run to waste in a perfectly deodorized, and, as it was believed, purified and inert state. It is found, however, that while the nuisance has thus been completely abated, so that the water which escapes is limpid and without smell, it nevertheless carries with it much soluble matter of use as manure; and thus many acres of land lying below the line along which it is discharged over the northern side of the valley, are greatly increased in productiveness and fertility. The filter, designed by the Prince, by which this result has been achieved ever since 1851, consists of a brick-built tank, 30 feet long and 4 feet deep, and as much wide, divided into two equal parts by a wall across it, which has a double structure, with an interval of 6 or 8 inches between its parts. A similar double wall is provided at the end, which receives the drainage of the house. Into the space within the first double wall the drains deliver their flow, which thus sinks to the bottom and passes through holes at the bottom into the inner tank. There it rises through three successive sets of trays, each carrying 2 or 3 inches deep of mould, through which the water ascends to the surface of the first division of the tank. Thence it flows down the space within the second double wall, and in like manner rises through mould in the second half of the tank, which it ultimately leaves in an almost perfectly clear state, and entirely without smell. This water is then conveyed, partly by open channel and partly by hose, to one point and another over ten or fifteen acres of land, being allowed to flow unguided for ten or twelve hours at a time at each spot. At intervals of two or three weeks the tank and its trays are cleaned of all mud and sludge, and this is mixed with earth and forms a useful compost. The success of this scheme, and the simple manner in which it is carried out, seem to prove its adaptability to the cases of large establishments, as workhouses, gaols, and barracks, wherever sloping land exists, on which matter at present wasted could be turned to profitable account. As a contribution to the solution of the sewage question, it may be mentioned here that the waste of a household num-



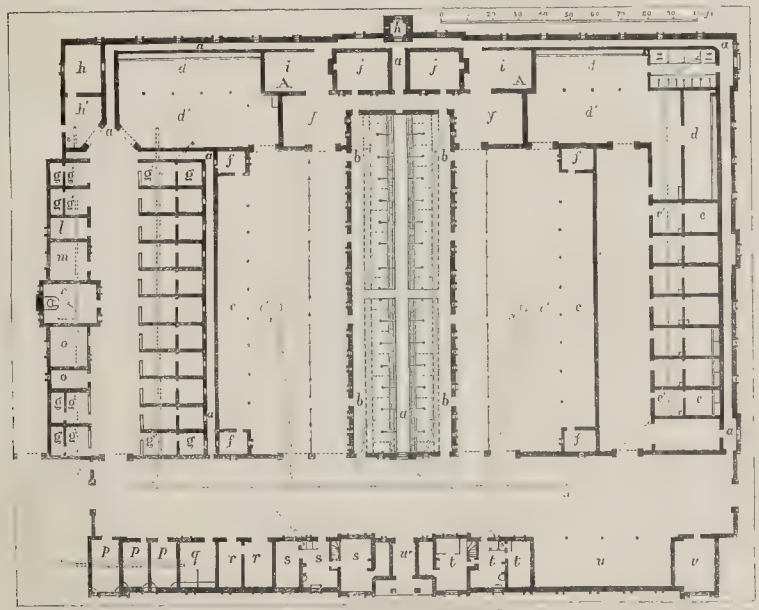
* "The Prince Consort's Farms: an Agricultural Memoir." By John Chalmers Morton, Editor of the "Cyclopædia of Agriculture." London: Longman, Green, Longman, & Co. 1863.

bering perhaps 150 persons during three months of the year, is thus delivered over fifteen acres, while the compost taken from the tank is applied to about one-third more. The produce of the grass is many-fold that of the land around it; and, eaten barer, it affords food enough for three or four times as large a stock."

In mid-winter, the land on which the house sewage is used is seen green in the midst of the generally bleached surface which poor grass land then exhibits.

Speaking of the Alverstone Farmery, Mr. Morton says,—"In the midst of this farm lies the tilery of the estate, where capital goods are turned out of all colours—white, red, and black. Moulds are used for every sort of brick required in the drainage either of fields, or roads, or stalls, or yards, and for every variety of brickwork connected with walls, windows, chimneys, roofs, eaves, and flooring." A gentleman-hobnails, to whom we submitted this paragraph, glowing with delight, said: "That's the way to improve your farms and lands: bring bricks to their doors." And so it is: but all are not able to effect it. The buildings on the various Royal farms exhibit great variety. For example:—

"There are the gorgeous dairy and magnificent cattle range of the Home farm, fit for inspection by Royal visitors; and the well-planned combination of stabling, cattle-boxes, stalls and yards, poultry-house and 'piggeries, with the covered sheep-shed over open floor, and manure tank underneath it, as a special feature at the Shaw Farm. The compact and compendious arrangement under a common roof of covered yard, with the stable on one side, and straw and food house, thrashing-barn, and granaries at the end of both—probably the latest improvement in modern homesteads—is seen at the



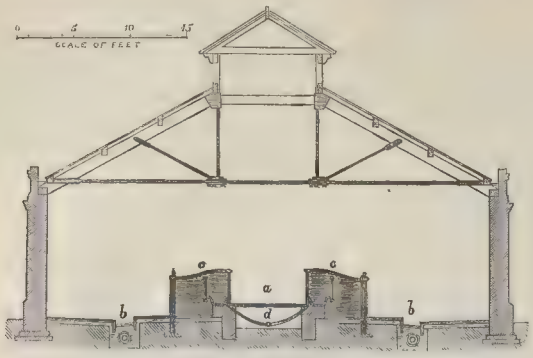
SKETCH OF THE DAIRY HOMESTEAD.

Flemish Farm. There is the old-fashioned thatched and wooden barn, with stabling, granary, and cart-shed, arranged around a large working court, in one corner of which stands the comfortable farm-house, at the Norfolk Farm. And there is something similar to this, though an improvement on it in respect to facilities for thrashing and for pig and cattle feeding, at the Rapley Farm."

All of these, except the last-named buildings, are fully illustrated by drawings and descriptions in Mr. Morton's pages. Of the illustrations we are enabled to give some examples.

The Dairy farm, Frogmore, built under the direction of Mr. Turnbull, exhibits many arrangements deserving of study. The principal feature in the arrangement is a magnificent two-rowed cow-house, with wide central gangway and lofty roof. The arrangements for watering and for draining, the latter being shown by dotted lines upon the plan, are most perfect throughout the building. The structure consists, it will be seen, of no fewer than five lines of building abutting upon a cross line which connects them, and which carries a clock-tower in its centre. A roadway runs across the other ends of these lines, and gives access up the intervals between them, which are used partly as roadways and partly as open yards. On the other side of this cross road, occupying, therefore, the same relative position as the cross line of building on the other side, stands another line with an architectural elevation, of which a separate drawing is given: it faces this dividing road. The other elevation of this row is seen in the isometrical drawing, which gives the general style of the structure. It includes cart-shed, cottages, loose boxes, and stables.

"From the southern end of it you walk up the space



PLAN OF THE DAIRY HOMESTEAD.

between the first two rows of which the main structure consists. On your right hand is a series of pigsties, fed from the roadway through Crosskill's hanging flaps. You may also look into them from the gangway separating them from the cow-shed, which is provided with an open yard upon its other side. On your left hand are other pigsties, stores for food and litter, boiling-house, slaughter-house, &c.; the whole of this department being a most complete establishment for the accommodation of the valuable herd of the Prince Albert Windsor pigs. Traversing the gangway in which the road terminates, you pass yards, *h*, *d'*, and stores for straw and hay, *j j*, to the other side of the building, where is another open yard *d'*, provided with sheds, a calves' house, *x*, and hemels, *e e'*, for feeding cattle, cows, and bulls. Between this, the fifth ridge line, and the fourth, there is, as between the first and second, a roadway, and on the other side of the roadway is a shed like the cattle-shed of the second ridge line, furnished, as it is, with an open yard. The central line is the noble cow-byre to which reference has already been made. Its dimensions will be gathered from the following section. The stalls are 9 feet wide, for two cows each, divided by slate partitions."

The iron trough for each is divided into three compartments—the central division for water. The raised gangway, *a*, has a stone floor, with slabs of slate on either side of it. The pipes, *d*, supplying water to the drinking-troughs, lie below the passage floor. The stalls and passage floors are asphalte. The gutter, *b*, presents a sloping cross section, allowing of the easy escape of water, which falls at intervals into the drain shown in section below it.

The whole of the floors are laid upon a bed of

SECTION OF COW-HOUSE.

concrete, and this has completely prevented rats, mice, and other vermin from burrowing below them. The several yards for cattle have drinking-troughs stationed in them, supplied on the self-feeding principle; and there are hydrants placed in various parts of the buildings, with a plentiful supply of water from the Castle waterworks in case of fire. The surface water from the roofs and roadways is carried away by a separate set of drains, which are not shown in the plan. The whole of the door and window jambs, the ornamental coping, corbels, terminal pieces, and panels in gables, are executed in terra cotta. This was done by the command of the Prince Consort, who took great interest in superintending the erection of the homestead, declaring when it was finished that he possessed the best cow-house in the world. The reader will easily gather, by an inspection of the plan, how well and with how much economy of labour it is adapted to its purpose. In nothing is this saving of labour more considerate or more economical, than in the provision of cottages for the herdsmen and young men employed in them. These occupy a position, *e* and *f*, on either side of the central archway.

It may be added that the whole of the soakage and drainage of the sheds and yards is conducted to a manure-house, outside the plan, but represented in position in the isometrical drawing.

Arrangements are here made, and wisely, to prevent loss by the fermentation of the soiled litter. On this point we have often spoken, believing that throughout the country two-thirds of the valuable farm-yard manure produced is either lost or spoiled by exposure to the elements. Mr. Morton dwells on the advantages of the covered and inclosed dung-pit, and no one need be alarmed at the expense; for he states that a construction at the Home Farm, 30 feet by 35 feet, and 10 feet deep, is sufficient as an appendage to buildings affording stall and box accommodation for 200 cattle of all ages, and fifty or sixty swine. Too much attention cannot be directed to Mr. Morton's observation on this subject; and we hope ere long to find every homestead provided, as of the first importance, with the means of protecting, till carted on to the lands, the natural and most effective fertiliser.

The Dairy and some of the cottages we have ourselves fully illustrated on previous occasions; and we must here terminate our present notice of this very valuable book;—valuable in two capacities,—as a manual of information useful to the proprietor, the agriculturist, and the architect, and as a further exposition of the sagacious labours in the cause of social progress of the illustrious man we have lost. He touched everything, and advanced all he touched.

THE APPROACHING MARRIAGE OF THE PRINCE OF WALES.

ALREADY the note of preparation is sounding throughout the land for the purpose of giving due expression to the loyal feelings of the public in connexion with this event. The corporation of the ancient and honourable city of London, and some hundreds of old and modern boroughs and corporations, are considering how best to do honour to the day. At Windsor Castle the decorators are actively at work; and before two or three weeks have passed St. George's Chapel, by the aid of carpets and hangings, will present a somewhat gay but impressive aspect. We, and thousands, would have been glad for the marriage ceremonial to have taken place in London. This, however, is not to be. Even at Windsor, however, a route from the Castle to the Chapel might be contrived which would allow many to see part of the wedding pageantry.

So far as the arrangements are determined, the future Princess of Wales will land at Gravesend, and there will be received by the Prince, and conducted from that place by the road to, and thence through, London. This will allow an opportunity for a marked expression of feeling; for, besides the welcome to be given to the fair stranger, this will also be the first public appearance of the Prince in this the capital of these realms. On this occasion we do not expect to see the old-fashioned towers, with surprises of mermaids, angels, and giants; but we need not lose sight of the tasteful and elaborate decoration of the streets through which the royal couple will pass. There should also be as much state and importance as possible given to the procession which will pass through London.

On most of those instances of rejoicing which have occurred in modern times, the street decorations have been sad failures; and this has been chiefly caused by the want of some good and general supervision. As these things are usually managed, everything depends on individual exertions; and, in consequence, the general effect is very unsatisfactory. There are many points between London Bridge and Buckingham Palace which would afford as good opportunities for display as do the streets of most foreign towns.

In the City there either has been, or will soon be, appointed a committee, who will arrange the means and superintend the preparations for the public reception. There should also be meetings of the inhabitants of other districts, at which committees should be formed and subscriptions opened for the purpose of meeting the necessary expenses.

We would not now in a stately procession see the numerous and armed bands of the nobility and gentry wearing the badges and mottoes of their chiefs; nor will the liverymen in their many-coloured gowns act the part of policemen, and keep the roadway of Cheapside clear for the approaching cavalcade; but in these days the discipline and good management of the police on such occasions is in itself a show; and instead of the armed retainers, we might array in a procession thousands of well-dressed and well-ordered workmen belonging to various trade and other societies. There are also the thousands of children of our charity, national, Sunday, and other schools, who, placed in proper positions, would not only make a comely sight, but also, by their united voices, be able to give a pleasant note of welcome. There are, too, the Volunteers, who will, no doubt, on this occasion, come forward in considerable numbers.

The short days of February will rapidly pass away, and we would have care taken to make timely preparation. The very circumstance of persons meeting together to consider the matter would lead to many practical suggestions, and probably add much to the effect of a general display. There will be considerable uncertainty respecting the arrangements for celebrating this royal marriage, until some official announcement of what the Government recommend on the occasion has been made. The month of March is scarcely a safe time to risk the display of fireworks in the parks; and the same may be said respecting the opening of a fair, or making display upon the Serpentine. It would be well, however, to hear as soon as possible what suggestions are made; and whatever may be determined upon, let it be well and earnestly carried out, so that we may succeed in publicly celebrating an event in which all classes of the community, both rich and poor, take much pleasure and interest.

THE CURIOSITIES OF SOME ENGLISH SURNAMES.

THIS subject, which some have considered of trifling consequence, has been of late exciting attention; and what with the singular origin of many names, and the changes and corruptions which have taken place in the progress of time, English surnames have become a matter of much curiosity. The belief that "the rose by any other name would smell as sweet," cannot rightly be held; for, although it is true that genius or good conduct can give distinction to names of no pleasant sound, it is also certain that in the artistic and literary world, and in other positions in life, the name of a youthful aspirant is not without a certain amount of consequence. About half a century ago, not only in many provincial towns, but also throughout most rural districts, and even in parts of the metropolis, it was the custom for persons to be best known by their Christian name, and one in addition descriptive of their pursuits, or indicative of some peculiarity, as in their manner and appearance. Even at the present time this primitive custom is not out of use in certain rural and mining neighbourhoods. In this way we have had generations of Boots, Ostlers, Gardeners, and other persons connected with inns and houses: we have also had the signs of the inns themselves; and in families of some note, the bearing of badges or cognizances have given rise to names,—among which may be placed Lion, Roebuck, Talbot, Swan, and many others. Local positions have also much affected surnames; and we find Horsefield, Woodford, Westgate, Northgate, Southgate, Eastgate, Blackgate, Whitegate, and other gates; Westgarth, &c. &c.

Then we have also a vast number of derisive and sarcastic names. Amongst these may be classed the Piggs, Milksops, Foxes, Slowmen, Tallboys, Whiteheads, Blackheads, Littles, Biggs, &c. We have remarked, as indeed every Londoner must have done, a disposition in tradespeople with certain surnames, either to adopt businesses having some noticeable connexion with their names, or to enter into partnership with other persons of surnames capable of thus attracting attention. We recollect of a milkman in King-street, Holborn, of the name of Milksop, for example; Flint & Steel, in Holborn; and in the "London Directory" may be seen the name and address of one Steer, a cowkeeper, in Whitechapel. There is a well-known nurseryman at Highgate of the name of Cutbush. Firms have often curious names, even though not significant of their calling;—Ward & Lock, the well-known publishers, for instance. Moreover, there are seasonable names, such as Spring, Summer, and Winter, and it might be worth while to search the Post-office Directories for the name of Autumn. The names of the months, however, seem to have been especially neglected in connexion with surnames. March is a name by no means uncommon; but it has had another origin than the month. The Fields form a numerous family: besides the simple name of Field there are Butterfields, Springfields, Meadowfields, and many others of this description; and there are persons of the name of Meadows, Cowmeadow, Hawthorn, and other terms which have a pleasant rural sound. We have often felt regret that the surnames of many of those who have been raised to the peerage have been changed in such a way that the original names, and even the means by which the first bearers achieved greatness, are forgotten by the general public.

Surnames which have foreign roots would make a long list, and show to what a great extent this country has been improved by the introduction of fresh blood. Examples of this importation of new names might especially be picked out in Spitalfields,—a district which was long prosperous; but which at present is shaded by a cloud of adversity. In Birmingham, too, and throughout the midland counties, there will be found lingering the names of those broad-shouldered and active Flemings who at one period gave a great impulse to the manufacturing industry of this country.

If George or Robert, the descendants of one Stephen, had lived in old times, and if it had been

then possible that they should have assisted in the invention of a locomotive, there is no doubt that some name would have been, in a cant way, applied which would have been even more familiar than Stephenson at the present time.

There are many shades of colour in surnames: thus, there are Whites, Greens, Browns, Reids, Reddies, Blacks, &c., and these names of colours have been in several ways corrupted. As regards some of the commonest of such surnames,—Brown, for instance,—its varieties are extraordinary, and the same may be said of others.

There are some surnames, the origin of which forms a subject of considerable discussion. For instance, there are Cæsar,—even Julius Cæsar,—and Death, Corpse, Skull, Suett, Raw, Ram, Dam, Rascal, and others mentioned by a contemporary. In accounting for such names it is worth while to remember that before the reign of Queen Elizabeth, when the registration of births and deaths was to a certain extent for the first time insisted upon, and the mode of doing this was reduced to some sort of system, many thousands throughout the land must have been obliged to decide for themselves, or to have decided for them by others, the question of surname to which they had no legal or established right; and to a great extent the general custom of employing cant or "nick" names, and the ignorance of the masses of the people themselves, would cause many of them not to be very particular as regarded the names which should descend to their children.

The origin of such names as those of the Smiths, the Wardens, Wardells, Armstrongs, Wrights, Cartwrights, Wheelwrights, Archers, Bowyers, Goldsmiths, and many others, is very evident; but there are a multitude of other surnames of comparatively modern origin. There are constantly foundlings cast away in the streets, squares, and by-lanes of our cities; and also in the country districts and provincial towns. In this way there are many odd names originated. Many, also, are born in the workhouses and unions, who are either named by the authorities, or very doubtfully surnamed by their mothers. Many curious notes might be gleaned from the parish books. At the Foundling Hospital, since worthy Captain Coram and Master Hogarth's times, there has been difficulty in finding names for the children. We have before referred to this circumstance; but it is worth while again to mention that a vast number of surnames have originated in this hospital, and that many which had become uncommon were revived: in this way it is likely that even the name of Julius Cæsar has come into use by a London shopkeeper; for at times the committee of management selected for a term had difficulty in finding new names for the poor foundlings. Sometimes a classical taste prevailed, and we find that those with "no name" became, like the negro slaves in America, Hannibals, Cæsars, and so on after the well-known heroes of antiquity: then would come a literary and artistic taste; and so we had the names of great writers and painters applied to helpless and forlorn little children.

The corruption of what have been in the first instance good names is a matter of complaint to many: for example, Mountjoy would be not a bad cognomen; but in the north of England it would to a certainty be corrupted into "Mainjey," a term applied only to diseased and dirty dogs.

When surnames have been corrupted or altered in bad taste, they may often be improved by the mere alteration of a single letter; and those which are incorrigibly unpleasant may, at very little trouble and cost, be changed altogether; but, in nine cases out of ten, the best plan is to determine by right personal exertions to give credit to a name which in the first instance might not be remarkable for either its beauty or its seeming fitness.

THE PNEUMATIC DESPATCH.

The modified revival of the atmospheric system appears to promise well, at least for the transmission of letters, parcels, and other goods. It may be a question whether it would not be the best system for underground railways in place of the objectionable locomotive. Lord Stanley of Alderley, the Postmaster-General, and Sir Rowland Hill, the Secretary to the Post-office, have officially inspected the working arrangements of the branch tube from the Euston Station to the North-Western Post-office, in Eversholt-street, previous to the transmission of the mails between these two places; the Post-office authorities having conceded this privilege to the Pneumatic Despatch Company; and on the arrival of the Postmaster-General and Sir Rowland Hill at the station, within the boundary of the Euston Terminus, they were received by Sir Charles Rich, one of the directors; Mr. Margary and Mr. Rammell; the secretary and engineer of the Pneumatic Despatch; Messrs. Blake and Stewart, of the London and North-Western Railway, being among those present. The working arrangements were thoroughly explained by Mr. Rammell, the engineer, and trains of cars were rapidly propelled backwards and forwards through the tubes. The cars contained heavy weights; being principally loaded with stout planks; and on the signal being given by Wheatstone's telegraph, they were despatched to the other end of the tube, with a pressure of about 4 ounces, in a few seconds over a minute; the average up the incline being about 1 minute 12 seconds, returning by vacuum in 1 minute 5 seconds. The mail bags—upwards of 120 per day—will be blown through the tube in 55 seconds to the post-office, Eversholt-street; the usual time occupied by the mail carts being at present about 10 minutes. Two persons were conveyed, in presence of the Post-office authorities, through the tube, and returned by vacuum without having experienced the slightest discomfort. The Postmaster-General observed that the system appeared from the experiments to be very satisfactory and efficient. Previous to leaving the station at Euston, Lord Stanley descended with Mr. Rammell into the air-chamber of the revolving disc, the motive power of which consists of a fifteen-horse power engine.

The next step of the company will be to lay tubes connecting the markets of London with Camden Goods Station, with a tube to the General Post-office and Pickford's depôt in Gresham-street; and these operations will eventually tend to revolutionise the carrying system of the metropolis, and relieve the crowded state of our principal thoroughfares.

GLASGOW ARCHITECTURAL ASSOCIATION.

The usual meeting of this Association was held on the evening of the 27th ult., the president in the chair. After the minutes of the previous meeting had been read, the hon. secretary laid before the meeting communications from the Institute of British Architects, and from the Architectural Institute of Scotland, Edinburgh, in which they intimated their intention of presenting copies of their printed transactions to this Association. Mr. Melvin then read an essay on "Propriety of Styles." A discussion followed.

CONVERSAZIONE OF THE MANCHESTER ARCHITECTURAL ASSOCIATION.

This Association held its annual conversazione in the Library Hall of the Athenæum, on Thursday evening, the 29th ult. A number of tables were arranged in the Hall, on which was displayed a valuable selection of goldsmiths' work and pottery. The latter comprised specimens of the progress of porcelain manufactory from the Grecian period down to the present time. There was also a fine selection of encaustic tiles and some choice serpentine granites from Cornwall. The whole of these were exhibited by Mr. T. Oakden. On the side tables was a magnificent series of architectural and other photographs, by Mr. Francis Bedford, lent for the occasion by his agent, Mr. C. J. Jackson; and on the walls were displayed some original architectural detailed drawings, by Leoni, the Italian architect, which had been contributed by Mr. W. J. Legh, M.P. Portfolios of original sketches by Italian masters, and valuable architectural works of design were placed about the rooms, and numerous architectural designs by native architects were hung upon the walls. At the lower end of the room was a full-sized model of a portion of a waterproof glass roof, constructed of the new sectional form of glass manufactured under the patent of Messrs. Showell, of Manchester.

Mr. Lawrence Booth, the vice-president of the Association, delivered a short address. He said it was the first occasion on which there had been a number of friends not connected with the Association present. It was only in a few of the large towns that associations of the kind were established; and it was considered that such an important city as Manchester ought not to be behind less important places in architectural matters. Their institution was founded in 1860, and from that time the number of members had been gradually increasing, the society now including about fifty members.* Some opposition had been met with where least expected, but the Architectural Association had extended to them the right hand of fellowship. Mr. Alderman Goadsby then addressed the meeting. He commented upon the great advance which had been made in the architectural adornment of this city during the last few years; and said that he believed, when the present distress passed away, other works would be commenced superior to anything before attempted. Mr. J. J. Lyons also spoke, and the proceedings closed about eleven o'clock.

PRESENT TO THE TOWN OF SWANAGE.

Mr. Mowlem, whose name in connexion with the stone trade of Guernsey is known to some of our readers, has erected and presented to the town of Swanage an Institute for the Working Classes. The building is described as being "in the Romanesque style, treated freely. The reading-room is 46 feet long by 25 feet wide, and 25 feet high, with a library under a spacious gallery at the west end. The building is erected of the Swanage stone, roughly hammer-dressed in random courses, pointed with black mortar. The dressings are of the same stone tooled." Mr. Mowlem has invested 200*l.* in the Funds for the benefit of the institute.

ST. FIN BARR'S NEW CATHEDRAL, CORK, COMPETITION.

The general committee for the erection of this cathedral have adopted the design with the motto "*Non Mortuus sed Virescit*," as that deserving the first premium, 100*l.*, and as that which should be the one ultimately built. To the design with the motto "Let us arise and build," has been awarded the second, 50*l.*

The delay in coming to a decision is said to have been caused by the anxiety of the committee to do full justice to the competitors by the exhibition of the plans to the public.

"*Non Mortuus sed Virescit*" is the design of Mr. W. Burges, of London. "Let us arise and build," that of Mr. T. Newenham Deane, of Dublin.

We have already received letters taking strong objections to the selection of the first design on the score of cost; but they reached us too late for consideration.

THE NEW MARKET AT CHESTER.

This new market will shortly be opened. The main front is in Northgate-street. It is built of stone from the Manley Quarries. Extending to a length of nearly 120 feet, it is 50 feet high in the centre to the apex, and 36 feet in the wings. It is divided into three parts, the centre slightly in advance, with two wings, corresponding with the threefold division of the internal roofing, the centre part being the widest. These are again subdivided into three intercolumniations by three-quarter engaged columns round and square, the square ones occupying the angles, all rusticated by horizontal and oblique bands, and supporting a Doric entablature and balustrade, broken over the columns, and which in the central part rises higher and follows the pitch of the main roof. A group of sculpture is now in course of execution to be placed on the apex of the building. A fountain of red granite is to be inserted in the inner columns on each side of the main entrance.

The interior is divided by ranges of cast-iron columns and girders into a centre and two aisles, the former raised about 10 feet higher, so as to leave a clerestory filled in with plate-glass luffers along the length of the building; further ventilation being provided by quasi clerestories 5 feet high, also filled in with luffers, produced by raising the central portion of each roof, and glazed with rough plate glass. The roof is constructed of light wrought T iron and king and tension rods, covered with diagonal boarding on timber purlins. Around the three sides of the market are ranged twenty-seven shops, and over that at the north-west angle is provided the inspector's office, overlooking and commanding the whole market.

The Fish Market, of an area of about 70 feet by 40 feet, is situate at the north-west angle.

Messrs. W. & J. Hay, of Liverpool, were the architects of the building, and have been assisted in the superintendence of the works by Mr. Richard Davies, the city surveyor. Mr. Roberts, of Chester, was the contractor. The style is described as an adaptation of the Flemish Italian, treated with freedom.

* In earlier days Manchester had a very active architectural society. Ed.

THE NOVGOROD MONUMENT, RUSSIA.—One of the Groups around the Orb.

THE RUSSIAN MONUMENT, AT NOVGOROD.

Our readers will have heard of the completion at Novgorod of the monument erected to commemorate what is called the one thousandth year of the Russian empire, dating from 862 to 1862. We are glad to be able to place a view of it before the public at a moment when the character of a memorial in which the nation is concerned is about to be decided on.

The upper part of the Novgorod monument, of bronze, consists of an orb, 15 feet in diameter, surmounted by the cross and two figures emblematic of the orthodox faith, as the foundation of the moral elevation of the Russian people. Around the lower part of the orb are nineteen figures, each 12 feet 6 inches in height, arranged in groups, personifying the six principal epochs in the history of Russia, and thus placed:—

Rurick—the foundation of the Russian state, 862.

Vladimir—the introduction of Christianity into Russia, 988.

Dimitry Donskoi—the liberation from the Tartar yoke, 1380.

Ivan III.—The foundation of the Russian monarchy, 1462.

Michael Fedorovitch—the restoration of the monarchy by the election of the house of Romanof, 1613.

Peter the Great—the reformation of Russia and the foundation of the Russian empire, 1721.

The lower part of the monument is partly of bronze, partly of granite. The portion immediately under the groups is of bronze, then comes a cornice of Serdobol granite, then a series of bas-reliefs in bronze, and then a socle of Serdobol granite.

The bas-reliefs, 5 feet in height, represent men and women (107 in all) who have contributed, by their exploits, to the glory of the Russian empire.

The diameter of the lower part where surrounded by bas-reliefs is about 28 feet: the height of the pedestal, base, and pavement, is 21 feet; and the height of the whole monument, 50 feet. The weight of the bronze portions is 65½ tons. The cost of the monument is stated to be Rs. 480,000, or, taking the rouble at 3s. 1½d., 75,000*l*. About one-third the amount has been raised by subscription: the remainder is to be paid out of the State treasury.

The group, of which we give an enlarged view, typifies the epoch of Vladimir. On one side, at his bidding, the people destroy their idols: on the other a mother offers her child for baptism.

In the general view Peter the Great is seen on the right hand side, protected by a winged figure, with the right hand on his right shoulder. The figure on the left of the view represents Michael Fedorovitch.

The monument, as a whole, is bell-shaped, to remind the Russians of the great bell which was always rung when they were threatened by an invasion of the Tartars. It was designed by M. Mikeschine, a young Russian artist.

A VISIT TO PART OF THE MIDDLE-LEVEL MAIN SEWER.

The members of the Holborn District Board of Works being desirous of satisfying themselves as to the progress of the works and general state and character of the Middle-Level Sewer, application was made to the Metropolitan Board of Works, and Messrs. Brassey & Co., the contractors, were instructed to afford every facility for pursuing the inquiries on which those gentlemen desired information. Descending down a shaft which was prepared in the contractors' yard, near the western bank of the Fleet, the visitors were ranged under the guidance of Mr. Lovick, assistant-engineer, and of Mr. Isaacs, C.E., surveyor of the Holborn District, and proceeded westward. The first part to which attention was directed was the junction with the Fleet. When the main drainage was designed, the Metropolitan Railway was but in embryo, and an alteration of the original plan had to be effected to meet the altered state of the case. This alteration has been made since the original line of sewer has been completed, and the whole business has been accomplished without injury to the property in the crowded locality through which it runs. Passing onwards the visitors were informed that the tunnel through which they were traversing was bearing on its shoulders the enormous weight of Reid's Brewery, a feat which it seemed to accomplish without flinching and without any apparent sign of the enormous load which it had to bear. Still moving westward, the visitors minutely examined the appliances introduced for the interception of the subsidiary drainage; how Gray's-Inn-lane, with its numerous courts, Bedford-row, and the regions of the Foundling and Bloomsbury, were provided with an outlet for their refuse, and the means for the periodical inspection of the main artery.

At the junction of Theobald's-road and Bloomsbury-square there is an awkward projection of houses which has long been considered the subject of metropolitan improvement. To avoid interference with these houses, a curve of an extensive character had to be constructed; and the visitors were surprised to find, on approaching this spot, that, although no external indications existed of work having been executed below the surface, the curve had been constructed and no impediment intervened to their progress, and they proceeded onwards until they reached that part of Oxford-street where the works, having been postponed in order to prevent interruption to traffic during the Exhibition season, they were at last compelled to retrace their steps in consequence of the tunnel not having been sufficiently advanced to admit of their further progress. The return journey was accomplished in much less time than the advance had been made, until a halt was sounded, when the explorers were by no means displeased to find that, although at so great a depth below the surface, the amenities of social life were not forgotten, and over a glass of veritable cliquot, they were enabled to drink the health of Mr. Lovick, the assistant engineer, who had devoted himself to the duties of cicerone, and of the contractors, Messrs. Brassey, Ogilvie, & Harrison, who had kindly placed their whole staff at his disposal to assist him in this duty.

Monument to the late Archbishop of Canterbury.—In is proposed to erect in Canterbury Cathedral a monument to the memory of the late Archbishop Sumner. With this view it is intended to raise a sum of 1,000*l*.

MONUMENT OF THE RUSSIAN EMPIRE, AT NOVGOROD.——DESIGNED BY M. MIKESCHINE.

A LECTURE ON ARCHITECTURE TO THE ROYAL ENGINEERS.*

ON being requested to deliver a lecture "On the Principles of Design in Architecture," I willingly consented to do so; the result of long and patient thought on the subject having led me to conclusions so different from those which generally prevail, that I am glad of an opportunity of explaining my views to such an audience as this, feeling confident of the correctness of the reasoning I am about to lay before you; and being, at the same time, impressed with the importance of a juster appreciation of the true conditions of the problem being generally diffused. It seems to me that unless this is the case, it will be impossible for any improvement to take place in the present very unsatisfactory state of architectural design. Unless, also, architects are agreed in the principles on which the science of their art is based, all criticism must be empirical and worthless.

Before, however, I attempt to define what architecture really is, let me first try to explain what it is *not*, for I feel convinced that one-half of the errors in design, and nine-tenths of those of the theory, arise from mistaken analogies with other arts with which it has no real affinity, and from false theories based on these erroneous data. First, then, architecture has no affinity in principle with painting and sculpture. These arts are what are properly called phonetic arts—that is to say, are voices, or represent what may be expressed by words. In Egypt painting was the only mode of perpetuating thought, but since the invention of the alphabet, painting has become subsidiary to writing; still all our paintings are either repetitions in a different form of what has been written, or representations of things which might be expressed more or less clearly in words. Hogarth's "Rake's Progress," for instance, or his "Marriage à la Mode," is a novel written with the brush. The thousand and one pictures which illustrate Milton's "Paradise Lost," or "The Vicar of Wakefield," are only transcripts in another form of the original poem or novel; and even our landscape or animal painters are only doing in a vivid manner what words would paint—if not so well, yet in some respects with more distinctness of detail. Sculpture is an art which has the same tendencies and objects as painting, only that it expresses by form what its sister art accomplishes by the employment of outline and colour. Still the pen, the brush, and the chisel, are only instruments for doing precisely the same thing, though in different ways. But architecture has nothing to do with words. No amount of eloquence will build a house, and no conjuration of words will keep out the weather, or warm the inside of a dwelling: words cannot make a house, and a building can only express a very few and limited class of ideas, and these only very imperfectly. Notwithstanding all this nothing is so common as to group these three arts together; and the painters, sculptors, and architects, are supposed generally to be men following different branches of the same profession, and are joined together in the same academies as if they had everything in common. Yet, unless you can thoroughly eradicate from your minds all idea that there is any analogy between them, it seems to me impossible that you can ever acquire any clear ideas as to what architecture really is or means.

If, however, architecture has no real affinity with these phonetic arts, there is another group of arts with which its relations are intimate, and all the analogies drawn from them are true. The group I allude to is that of the useful or technic arts; and without attempting to go into any classification of these it will be sufficient at present to define them as those arts which provide for mankind *food, clothing, and shelter*. By a beneficent arrangement all these, which, in the first instance, are indispensable for his existence, are capable of being refined into fine arts, so as not to supply the wants, but to gratify the tastes of mankind. It is the desire to possess these refinements which is the greatest incentive to exertion, and it is practically their possession which distinguishes the civilized from the savage races. To take an instance: man cannot eat raw meat, and even raw vegetables or fruit are very poor food to work upon, so that roasting and boiling become quasi necessities; but when men have leisure and means they soon become dissatisfied with even these, and stews and compounds of various kinds become indispensable till at last the useful art of cookery is refined into the fine art of gastronomy.

It is the same with clothing: a sheepskin and a blanket are sufficient to keep out the cold, but these have been refined by steps I need not trace, into art as elaborate and as expensive as any other. The fairer half of the creation, at all events, spend more time and money on making their dress beautiful than, I fear, is spent on architecture; and even men are not always quite free from the hankering after the beautiful in this form.

It may at first sight appear comparing great things with small to compare architecture with gastronomy and tailoring, but this is not the question: what I assert most unhesitatingly is, that the useful art of building is refined into architecture by the identically same process by which cookery is refined into gastronomy, or tailoring into an art without a name. The same process which refines a boiled neck of mutton into a dish of cutlets *à l'Impériale*, or a grilled fowl into a *Poulet à la Marengo*, or any other elaborate compound, is the process by which a hut to shelter an image is refined into a temple, or a meeting-house into a cathedral; and so essentially is this the case, that if you wish to acquire a knowledge of the true principles of design in architecture, you will do better to study the works of Soyer, or Mrs. Glass, than any or all of the writers on architecture between Vitruvius and Pugin. Architecture is thus nothing more nor less than a useful art, necessary for the existence or convenience of man, refined into a fine art in order that it may also minister to his intellectual gratification.

In this country the civil engineers are the plain cooks, and, though most excellent in that capacity, generally make a sad mess of it when they borrow a cookery-book and try their hands at a higher flight. The architects with us are what the French call *des Artistes*, and, like their confreres, are very indignant when asked to superintend the spit or to look after the boiling of a leg of mutton. Both are excellent in their way, but the fact is that no line can be drawn between them, and no one can say where the useful art ends, or where the fine art begins: it changes with times, places, and subjects, but the process is the same in all branches; and whenever you desire to refine any useful art into a fine art, there is only one path by which it can be done, and that is the same for all: if you deviate one hairbreadth from that path, you get into difficulties, from which no talent has ever yet been able to recall the wanderers.

It is hardly necessary to enter into the argument whether it is expedient to build beautifully, or to cook elaborately, or whether we ought not to be content with plain roast and boil, or plain undisguised brick and unhewn stone: all, I fancy, will agree that the element of beauty or refinement, if it can be obtained without unnecessary inconvenience, or without materially enhancing the cost, ought to be aimed at; and that this, when it is accomplished, is a gain to the refinement and dignity of mankind.

If all this is as clear and simple as has just been stated, it may well be asked why it is not universally acknowledged, and how was it that men ever came to believe that there was any connexion between architecture and the phonetic arts, or ever came to practise it on these mistaken principles? The answer to this is unfortunately only too easy and obvious. When in the fifteenth and sixteenth centuries men re-discovered the literature of Greece and Rome, they were so much struck with the immense superiority of the classical literary models, as compared with anything that had been done in Europe during the middle ages, that they one and all became enthusiastic classicists. So far as literature only was concerned they might be right; and they were also, perhaps, not far wrong in reproducing the refinement of the classical ages in the sister arts of painting and sculpture. The error was in jumping to the hasty conclusion that the same reasoning applied to architecture also; in fact, that the principles of the phonetic arts might be applied to the technic, or useful arts. No sooner was this false analogy conceived than architecture was taken out of the hands of the true experts—the master masons who had brought it to such perfection—and was handed over to such men as Alberti, a scholar; Michaelangelo, a painter and sculptor; Raffaelle, Perruzzi, Sansovino, Giulio Romano, and others who were painters—in short, to the artists who practised the phonetic branches of fine art, but who had no real knowledge of construction or any definite idea of the principles on which the art ought to be carried out. From that day to this the error has never been thoroughly corrected. The architect has become a man who conceives a design for a building *ab externo*, as a painter conceives the design of a picture; and very rarely indeed a man who works out his forms *ab imo*, or from the real essential necessities of the case. The idea of a man sitting down in his office to prophesy buildings of all sorts and kinds, for all purposes and all places, never occurred to any one in the Middle Ages. They did not then believe that any human intelligence was capable of foreseeing the ultimate form of 50 or 100 buildings; of drawing, measuring, estimating, and describing every detail before a stone was laid on the ground. They set to work in a very different style: one man devoted his whole life to one particular class of building, and undertook one building at a time; and, assisted by masons, carpenters, carvers, and ornamentists, each of whom had devoted his life to his speciality, and was devoting his whole time to that one work in hand, they elaborated among themselves, during a long course of years, those buildings which we now so much admire, and admire simply on account of the amount of honest, earnest, skilful thought that has been devoted to their elaboration. The one simple object that these men set before them was, how to produce the best possible building for the purposes entrusted to them with the means at their command. The last church, the last castle, or the last mansion, nearly of the dimensions of that they were undertaking, served them as a model; and with such altered conditions as their purposes necessitated they set to work, introducing as they went on every amendment in construction that had been introduced since the last was built; every improvement in arrangement, and every new form of ornament that had come to be admired in the interval. They thus went on gradually accumulating experience, till at last they reached that degree of perfection which so much astonishes us now, but which then enabled any village mason in the fen country, or in the Moors of Cumberland, or Wales, to produce buildings which our greatest and most learned men are now trying to emulate in vain.

This simple system had the further advantage that everybody understood it. If a priest wanted to build a church, a baron a castle, or a gentleman a mansion, they knew what was the model that suited them best, and they knew also where to find the man best suited for their purposes. The conditions of the problem were so simple that every one could understand them. There was no looking back to past ages, or to other countries. No learning or antiquarian skill was needful, nothing, in short, but a knowledge of what was going on around them. It was then with architecture, as it is now with ship-building, engine-making, or any other useful art. A merchant does not require any deep knowledge of the art of ship-building to know where to find the man that can build him exactly the ship or steam-vessel he may want, for carrying, or for speed. If a man wants a marine steam-engine of a certain quality he knows where to find the men who can supply it. If he requires one for pumping, there exists another class who make their speciality; and if he wants a locomotive, he knows also where to go. Thus, without any special knowledge of ship-building or engineering, any man may now be sure of getting exactly what he wants, and of the quality he requires, by applying to those men who have made it the special study of their life, and who, consequently, know all that has been done or can now be effected. It was precisely the same in the Middle Ages: priests, barons, gentry, all knew what they wanted, and they knew also where to find it; and they have found it, too, in a manner we well may envy, but hitherto have failed to compete with. With the Renaissance a new element was added to all this: besides the necessities of convenience and construction, the building, if a church, was to look like a Roman temple; if a palace, like a Roman amphitheatre, or bath; and if a villa, like what that of Pliny or Lucullus was supposed to have been. This was not the work of an architect or a builder, but of a scholar or antiquary, and his subordinate workmen knew nothing of all this; so the architect was obliged to spin the whole out of his own head before commencing, and deliver it complete to be carried out by men who had not the smallest conception of its meaning, or of the purposes the various parts were meant to subserve or express. In fact, the whole secret of the problem lies in this, that during the Middle Ages, and during the existence of any true style, men practised architecture precisely as we practise any other useful art. Precisely the same process that converted the galleys of Edward into the three-deckers or ironsides of the present day, converted the rude churches of our Saxon forefathers into such cathedrals as those of York and Lincoln,

* By Mr. James Fergusson.

or the spinning-wheel of the cottage door into the hundred-spindled mule of our cotton factories, bit by bit progress towards a well-defined end, steadily persevered in for years without ever turning to the right or left, or ever admitting of the introduction of any extraneous element. Since that time we have added the new element of the problem in architecture alone of all the sister technic arts: we have insisted that, besides convenience of arrangement, perfection of construction, and beauty of ornament, the building shall look, or try to look, like something that was done in some other clime or at some other age, and was probably for some other purpose. It is as if we were to go to Scott Russell and ask him to build us a steam-boat, but insist at the same time that it shall have three tiers of oars, and look in every respect like a Roman Trireme; or go to John Penn and order a steam-engine, but stipulate that it must be so arranged that it must look like a wind or a water mill. These orders would not be so ridiculous as insisting that an architect shall build you a museum, but shall put up in front of it a screen of columns intended for, and useful only in the temples of classical times; or shall build a Protestant place of worship in which you can neither see nor hear, nor sit with safety or comfort, and all because in the Middle Ages seeing and hearing were not important, and because our forefathers were too rude to suffer from draughts or hard seats.

The fact of an æsthetic element being introduced into the practice of any art, makes no difference in the argument; for, as before hinted, all arts, phonetic or technic, are capable of this species of development. Thus, prose is capable of being developed into poetry; narrative into eloquence; a mere photograph into a highly imaginative painting; a figure in wax-work into an Apollo Belvedere, or a Venus de Medici; by exactly the same process by which cookery becomes gastronomy, tailoring costumery, or building architecture. But each is developed into beauty within its own limits: there is no shunting of one art into the province of another to obtain this result; nor is it possible within the limits of the art itself to tell where use ends and beauty begins; and certainly no new principle is developed by the change in the manner in which the art is practised in its various phases. So far as I know, there is no instance in the history of the world of one art invading the territory of another, except in the solitary case of architecture during the last three centuries; and the experiment has been so unsuccessful that it is not likely to be repeated. If it had succeeded, the anomaly might have been overlooked, and the apparent absurdity forgiven; but, as the result is entirely the other way, it is time it should be abandoned. It is, perhaps, not too much to say that, though more money has been lavished, and more talent employed in building during the last three centuries than at any previous period, not one single building has been produced which is entirely satisfactory, and thousands which are very much the contrary; while during the three preceding centuries it would be as difficult to find a single edifice in any part of Europe which is not beautiful in itself, or which we cannot now contemplate with delight. The latter were the work of men comparatively ignorant and rude; the former of men in the highest state of civilization and refinement which the world has yet known; and this difference in result can only be ascribed to the difference in the principles on which the art was carried out during these two periods. It is high time, therefore, that architecture should recover her true position as one of the most important of the useful arts in the utilitarian stage of her development, and as the one most suited for artistic development, and perhaps the only one capable of rising to grandeur or sublimity in the second or æsthetic stage. Her true career is so grand, and her purposes are so noble, that she can very well afford to repudiate any connexion with the phonetic arts which belong to a totally different class, and need not borrow shreds from their adornment. Her own principles suffice for all her own purposes; and when these are honestly carried out, she has no rival among human arts except among the highest flights of poetic literature.

Elements of Design.

Without further preface, then, let us come to the practical point. What are the means by which a satisfactory architectural design may be obtained? The best general answer that can be given to this question is, perhaps, that which was given by the painter Opie to a young artist from the country, who, struck with the brilliancy of Opie's colouring, timidly ventured to inquire with what he mixed his colours. To this the gruff old painter briefly replied,—*Brains!* In that one word is the whole theory of architecture. If a man will only think of what he is doing, and think of that only, I defy him to produce a bad design. A vulgar man may impress something of his own vulgarity upon it; a weak man, something of his feebleness; but if the position of the art is up to the mark of the age, these will not be perceptible to the general eye. An earnest purpose-like design, pretending to be nothing but what it is—going straight to its object, and giving evidence of careful study and thought, must always be pleasing, not only to its contemporaries, but through all ages, even if neither ornamented nor ornamental; while no extravagance lavished on a falsehood can remain tolerable beyond the fleeting fashion that gave rise to it.

To descend a little more to particulars, the principles of design in architecture may be classed under four distinct heads, thus:—

1. Convenience in arrangement.
2. Economy in construction.
3. Ornamental arrangement.
4. Ornamented construction.

The two first belong, properly speaking, to the builder, or to the engineering part of the profession; and only the latter two, strictly speaking, to architecture; but unless he gets them done for him, which sometimes, though rarely, may be an expedient arrangement, no architect must neglect the former two. Indeed, the foundation of all good architecture is, that the building shall be so arranged as to meet the purposes for which it is intended in the best possible manner. This alone will not suffice to make a building beautiful, but it will go as far towards it as almost any other quality, and nothing that can be added will redeem the want of it.

By economy is meant that all the material used in a building should be so employed that the greatest possible amount of work shall be got out of it. When this precept is carefully attended to it frequently happens that a stable and elegant building may be erected with a certain proportionate amount of material, while with twice that quantity less scientifically applied, a clumsy rude edifice is all that is obtained, crushing itself by its own weight. It is, in fact, doing by reflection and science what too often is attempted by brute force. Like any other good principle, it may be carried too far, but it may safely be asserted that nothing adds so much to the charm of Gothic buildings as the scientific economy displayed in every part of their construction.

The third principle, enumerated above, is the foundation of all good architectural design, and consists in arranging the various parts of a building, or of a group of buildings, so as to be in harmonious proportion one to another, and so that each may aid every other part in producing the effect desired. By thought and care this may generally be obtained without any extra expenditure of money or materials, or with only the slightest if any loss of convenience. As such it ought always to be the principal study of the architect, and as the means by which the most permanently satisfactory results may be obtained. The fourth principle, which is the special province of architecture, ought always to be treated as an addition—something very useful towards architectural effect, but not as essential. It ought never to be allowed to interfere in any way with convenience, nor with economy of materials: its main use is to aid and refine ornamental construction, to accentuate the constructive details, and, if I may use the expression, to tell the whole story of the building in an agreeable manner.

Ornament is extremely useful in conferring on buildings a degree of elegance and richness, which, without it, it would be difficult to obtain; and it also may be made to convey an impression of wealth and magnificence which, in its absence, could only be attained by increased dimensions, or massiveness, which would be as expensive, and, in some instances, at least, less effective. Ornament is also extremely useful in altering the apparent proportion of buildings: thus, by the employment of strongly-marked horizontal lines, a building which is too tall may be reduced to proportion; one that is too low made to look nearly as high again by employing only vertical features. Buildings that from the inherent necessities of their construction look weak, may be made to appear of any desired degree of strength, and sparkling gaiety of effect be given to those that otherwise would be too massive and heavy.

Internally, the architect very often cannot control the dimensions of his apartments; but by a judicious application of ornament he may always make low rooms look higher, narrow rooms broader, and reduce long rooms to a better proportion. More than even this ornament enables an architect to give to every part of his design exactly that degree of prominence and dignity, and that class of expression which suits its position or purposes. These are all legitimate uses for the employment of ornament, and when used for these purposes it is never offensive. It always becomes so when it is employed to conceal either use or construction, or to make a building try and look like what it is not or cannot be.

Ornamental Arrangement.

In order better to explain what is meant by ornamental arrangement, let us take an example. It is proposed, for instance, to erect a barrack for say 1,000 men. The first thing, of course, is to study the economy of the regiment, and to ascertain exactly what is wanted. There must first be dormitories and living-rooms for the men—quarters and a mess-room for the officers, quarters probably for married soldiers, an infirmary or hospital, an entrance gateway, main guard and canteen, &c. If you arrange all these in a row any how, you will get a very commonplace effect. But supposing you divided your men's barracks into four nearly cubical blocks, and place them at the angles of your square, and fill up the longest curtain with the officers' buildings opposite the entrance, and let the married men's quarters and the infirmary or other offices fill up the other two. If all these buildings are well proportioned to each other, and each appropriate to its own use, you may get a very pleasing and stately effect without one shilling of extra expense. But if, on the other hand, you make the officers' quarters exactly like those of the men, as is done in this barrack,—if you make the field-officers' quarters like those of subalterns, you lose one of the principal elements of architectural expression, and the design loses all the meaning it might otherwise convey. In this instance I recommend the principal masses being placed in the angles, not only for sanitary purposes, but because in nine cases out of ten it is better architecture to accentuate the angles, than to attempt to dignify the centre. We have got into the contrary practice from the habit of using porticoes, which can be only applied to the middle of a building, but half the weakness of modern design is owing to this cause: in military constructions especially it is most prejudicial.

The above assumes that the barrack is built on a perfectly plain site, but if the ground undulates there is nothing gives so perfect an architectural result as a design suited to, and following all the accidents of the situation: no matter how irregular the result may be, the evidence of thought and design, which a motived irregularity gives, redeems any other fault; but it must be motived; irregularity for irregularity's sake is mere affectation, and ought never to be indulged in.

One of the best and most important modern examples of ornamental construction that can be quoted is, perhaps, the recent juncture of the Louvre and Tuileries by Visconti. When the latter building was erected, it was so distant that its architect never thought of making its plan range with that of the older building; and in the least artistic age of French architecture, Henri IV. joined the two by the long gallery, without ever thinking of the principles of ornamental arrangement. The consequence has been that, for more than 200 years, every French architect of eminence has tried to remedy this defect. Fifty of their plans are now exhibited, some of great ingenuity, but on the whole perhaps the best is that by Visconti, which has just been carried into effect by the present Emperor of the French. It does not remedy all the defects introduced by the negligence of the first designers, but it goes a great way towards it, and generally speaking, it produces a grand and harmonious effect, even irrespective of all ornamental details; but the Place de Concorde is still too large for the buildings that surround it, and unless it is broken up by some erections in its centre, these will always look low and comparatively mean, while a judicious ornamental arrangement would add immensely to their beauty, and give them a dignity they do not now possess.

But, besides the ornamental disposition of masses, any one building may be so ornamentally arranged as to produce the best possible architectural effect without ornament, or with only the smallest possible amount of applied decoration. The Gothic architects were the great masters in this department of art: take, for instance, Salisbury Cathedral: the windows are without mullions, the buttresses without pinnacles, and with very few mouldings, while the walls are singularly plain; yet with all this, the nave, the two tran-

septs, and the choir are so pleasingly arranged as to produce the best effect; and if you come to look closely into it you will find that the problem being given of producing a vaulted hall of a certain height, to cover a given area of floor space, it would be hardly possible to do it at less expense. The buttresses, for instance, on which the external effect mainly depends, are the most economical way of disposing of the quantity of materials required for the purpose, and the intersecting transepts the cheapest conceivable mode of roofing a great area of floor space, and at the same time of making a small building look large internally as well as externally. The Italian architects, who neglected these expedients, used, in consequence, three or four times the quantity of material which the Gothic architects employed. In St. Paul's, for instance, one of the most mechanically perfect of modern buildings, the area of the solids, as compared with the voids, is 1 to 6; St. Peter's as 1 to 4, St. Isaac's and other churches about the same; while at Salisbury, and in most early Mediæval buildings, it is as 1 to 8, and in later Gothic buildings, it generally may be quoted as 1 in 10, and in some in even a lower proportion than that. Or, to take another example, I have here a section of Westminster Abbey, showing the buttresses on the south side of the nave: nothing can be more purely mechanical than they are, but nothing can at the same time be better adapted to resist the thrust of the vaults of the aisles and nave, which, owing to the interposition of the cloister, they could not approach. A modern architect would probably have built a plain wall at right angles to the thrust, and sloping slightly inwards, have met the difficulties of the case. In so far as expense of execution is concerned, the Mediæval plan may be the most so: to cut the stone of each arch into voussoirs and to put a moulding under each flying buttress would, probably, cost from 5 to 10 per cent. more than to build a plain wall, the amount of materials and the height being the same in both cases; but to do the same amount of duty the wall in this instance would require at least a third more material, because its mass would be near its base, where there was no work to do, so that the ultimate expense would probably be greater. The real objection, architecturally, to the modern system, is that the wall would be a hideous deformity, the buttress a thing of beauty, because it is thoughtful and truthful.

There is at the present day a class of architects among the younger members of the profession who, struck with the fact that truth is one of the great, perhaps the greatest, element of architectural beauty, carry this system to excess. In their churches, the plain brickwork is shown inside as well as out, the timber-work of the roof is all shown, and not arranged symmetrically, but according to the mechanical exigencies of the case only. In dwelling-houses the timbers of the drawing-room roof are equally exposed, rudely squared, the bolts and screws all shown; the doors are plain deal; the windows heavily timbered. Notwithstanding all this, if the proportions are good, the light judiciously introduced, and you can trace the evidences of thought through the design, the effect is certainly pleasing and satisfactory, because truthful; but these men are mere builders, not architects. To produce an architectural effect a certain amount of symmetry is indispensable, a certain amount of refinement, combined with the greatest possible amount of mechanical excellence. All these can frequently be superadded without any material increase of cost; and when these are conjoined with truth of design and construction, a very perfect architectural effect may always be obtained, even without the addition of ornament. It is, however, quite a mistake to suppose that rudeness can ever be a desirable quality in modern times, or that proclaiming the fact that the mechanical have overruled the artistic elements in a design, can ever be productive of that expression of beauty we are aiming at in architectural art.*

* To be continued.

THE CONDITION OF LANCASHIRE.

THE terrible distress which has fallen on the manufacturing population still continues; and the heavy cloud which has for so long a time hung over Lancashire does not yet show its silver edge. In certain districts the number of the unemployed has slightly decreased; but we fear that the continuance of this improvement is uncertain, and we can see indications of complications which may ere long give rise to much contention and angry feeling. The workpeople complain of the bad materials which are at times put into their hands, and say that with them they are unable to work for the same amount which is allowed in charitable or parish relief. There will also, we fear, be some dispute respecting the rate of wages. Any difference of this nature would, in the present position of affairs, be attended with bad results to all.

Both men and women are getting tired of their listless idleness; and the long delay of the hoped-for good time coming, when they will be in full work again, begins to cause a certain amount of impatience and dissatisfaction. Something must be done to put them to real work. At one time we stood alone in saying this; but now others are urging it also.

The correspondent of the *Daily Telegraph*, whose reports from Lancashire have been remarkable for their truthfulness and many practical suggestions, notes that infectious maladies seem just now to be re-appearing in various districts among the poor of Lancashire. In some, scarlet and typhoid fever prevail; in others, diarrhœa and typhus fever; and in many, diseases of a cutaneous character. The latter are very prevalent amongst the females in some of the industrial schools. This is very singular; because, to all appearance, the factory-girls attending such establishments are a hundred per cent. neater and cleaner now than they ever were before. The writer says—"The re-appearance, at any rate the increase, of typhus fever, &c., in certain towns and districts, is also difficult to account for. When it first broke out the cause was plain,—destitution, bad and insufficient diet, &c. But all that has been removed. Diet has been improved in both quantity and quality: the poor are, comparatively speaking, well clad; and there is none of that destitution which originally marked the ranks of the operatives."

As we have before said, the destitution which for some time prevailed—and even now the supply of food in many instances is not sufficient—would have an injurious effect upon health; but, besides this, it will be found that the main cause of sickness is to be sought for in the homes of the people. We know that overcrowding is one chief cause; and there are, besides, those sanitary derangements, which, when the minds of men and women are troubled and filled with anxiety, food not being so plentiful as required, are sure to have injurious and even fatal effects.

The overcrowding of sleeping-rooms, in small ill-ventilated houses at night, is a sure means of producing fevers and many other disorders.

It is to be feared, also, that sufficient care is not taken to ventilate the sewing-schools, and other places in which large numbers of persons congregate. A stranger going into some of these interiors, in which 200 or 300 and upwards of women and young girls have been confined for several hours, would be surprised at the polluted state of the atmosphere. These matters require the most careful attention, for it is in such situations fevers are generated. In the months which are to come, sanitary care is almost as needful as the supply of food. At Preston, the fever is again on the increase: at Bacup it prevails severely: at Darwen, gastric fever is prevalent (several fatal cases of scarlet fever are reported); and from other parts there come unfavourable accounts.

In various districts a strong desire for emigration is shown by the operatives, and a considerable number have departed for America, and the more distant colony of Queensland. Many of the best and most intelligent of the hands are in favour of this movement; nor is this to be wondered at, when we consider the state of uncertainty which exists in Lancashire. It is feared, however, that many of the emigrants will experience disappointment, and that, when the cotton famine shall have come to an end, the skilled workmen will be missed at home.

ARTIFICIAL INDIA-RUBBER.

SOME years since we suggested that a time would probably come when essentially the same substance as india-rubber would be artificially made; and adduced such known facts as that bitumen when chemically manipulated in a certain way with sulphuric acid yielded an elastic gum very analogous to india-rubber, but unfortunately not permanent in its assumed properties; and also that linseed oil, when exposed in thin surfaces to the air, became oxidized, and very much resembled india-rubber.

In consequence of our suggestion a correspondent wrote us some time thereafter, stating that it had induced him to try to form a substitute for india-rubber or gutta percha by help of leather parings; but the result was rather crude; and besides, as we explained at the time, it was not our purpose to suggest anything but artificial modes of producing a substance equivalent to and in a manner identical with india-rubber.

Something very like the desired substance has of late been talked of as now producible by oxidizing linseed oil; and we give the following particulars as to this and another invention, extracted from a report, in the *Sheffield Independent*, of objects of interest exhibited at a *conversazione* of the Sheffield Literary and Philosophical Society:—

"In the chemical department were shown specimens of a new and valuable invention, patented by Mr. A. Parkes, of Birmingham, and called after him, 'Parkesine.' It is a compound of oil, chloride of sulphur, and collodion, and may be used as india rubber and gutta percha. In its plastic state it is easily pressed into moulds; and when set becomes hard and durable. It may be produced of any colour, and also made to imitate ivory. If this latter substance can be successfully imitated, Mr. Parkes will have accomplished what many men have long tried to do, and on which some have in vain sacrificed fortune and health. The inventor only shows the articles as the work of an amateur, and to give some idea of the capabilities of the material, which he says can be produced in quantities at 1s. per lb. Allied to this is another substitute for india rubber,—'Campticon,' an invention of Mr. Frederick Walton. This remarkable substance is formed by the oxidisation of linseed oil. Plates of glass are dipped into linseed oil, and allowed to dry. The plates are again dipped and dried, until a sufficient film has accumulated, and then it is removed. In describing his invention, Mr. Walton says:—'I soon found that by crushing the solid oxidised oil obtained in sheets, as described in my patent, and working it thoroughly in hot mixing rolls, I produced a substance which required only the cohesive nature which exists so strongly in india-rubber. The addition of a small proportion of shellac soon gave that which was wanting; and I found in my power a material singularly like caoutchouc when worked into dough; and which could be rolled on to fabrics in the same manner and with the same facility. Pigments could easily be added to give colour, and the addition of the resins gave other or rather varied proportions of adhesion, useful as affording the means of uniting fabrics as by rubber. Fibre, whether flock or cork, mixed in and rolled into sheets, gave me samples of kamptulicon and other floor-cloths. Not only has this singular product been thus assimilated to rubber for uses on fabrics, or combined with fibre for floor-cloths; but, still more strange, it is capable of being worked with pigment and vulcanised exactly as india-rubber has been described to be, and forms a hard compound like vulcanite and ebonite, excepting that the sulphur is not necessary. It will readily be seen how valuable a substance is here represented; for while it possesses in so great a degree all the qualities of india-rubber, it may be produced at a much less cost. The specimens which Mr. Walton has sent for exhibition show the material in its different stages of manufacture, from the films that are removed from the glass to the masses ready for manufacture into any of the articles above enumerated."

We may here note that in the same exhibition was what is called an "interesting novelty" in the form of a machine for copying sculpture. But considering how many years such a machine has been in use, as witness the successful copies of sculpture made by it for the Art-Union of London, the novelty of such a machine is a mistake. It is thus described:—

"The plan of its operation is simple. The bust or statue to be copied is placed on a revolving pedestal; and on a corresponding pedestal is placed a block of stone, roughly cut into a shape somewhat resembling the work to be copied. Over the copy and the block is suspended a lever, on one side of which is a blunt pointer, which touches the copy, and on the other a graving tool which touches the block to be cut. As the machine works, the block is cut down until the pointer touches the copy; and as it follows the variations of the one the graving tool makes corresponding shapes on the other, until a faithful and perfect tracing is obtained. The machine was worked by a small model steam-engine."

BARBER SURGEONS' HALL.

THE quaint and picturesque entrance to this hall, which is so well known to the wayfarers along Monkwell-street, is now nearly hidden from view by a huge board, on which is announced the intention of disposing of a considerable part of the premises on a building lease for 99 years. The houses Nos. 33, 34, and 35, the frontage in Monkwell-street, in part of which is the gateway, are in this way advertised for sale; also a portion of the courtyard in the rear, and the passage leading thereto and the greater part of the Barbers' Hall, kitchen, scullery, and outbuildings, having a street frontage of about 83 feet, by an average depth of 116 feet. In some parts the premises extend back to a depth of 135 feet.

The carving above this doorway, illustrated in one of our earliest volumes, is bold and masterly. It is to be hoped, therefore, that in carrying out any alterations, it will be preserved. The large head in the centre, and two little side figures expressive of infancy, are very good, and the arms of the company above are well cut and emblazoned. The large hall has great interest, for part of it is formed by one of the only two remaining circular bastions of the ancient city wall. The outer portion of this defence is in Cripplegate churchyard.

This relic, standing as it does much out of the way of every one, should under no circumstances be demolished.

DOINGS IN DENMARK.

WE glean some information interesting to our readers from the *Danmark*:—One of the final measures of the Danish Parliament was to pass several Railway Bills, whereby the net of State railways may be regarded as settled for a long time. This railway net spreads over North Jutland and Fyen, and consists of a trunk line from Aalborg, in the north of Jutland, over Aarhus and Fredericia to Vamdrup, on the Slesvig border, and a branch from Aarhus, over Viborg, to the west of the Limfiord. On Fyen the line will run from Nyborg, over Odense, to Strib, opposite Fredericia, in Jutland. The connexion between the Sealand line and the Fyen line, and between this and the Jutland will be by means of a steam ferry for goods and passenger waggons. As soon as a similar communication is established between Helsingborg, in Sweden, and Elsinore, in Sealand, the whole Scandinavian North will have a satisfactory iron route to the European continent. The execution of this railway-net has been intrusted to Sir Morton Peto. Its whole length is about 300 English miles, and its total expense about 16 millions of Danish dollars.——In Copenhagen the old watchman, with his long coat and his "morning-star," is to "move on" and make room for a brand-new police-force, partly arranged on the English model. On the 1st of April this new city-guard will commence its duties, according to an Act just passed in the Danish Parliament. The capital, with its 160,000 inhabitants, is divided into six districts, each with its station. The police director and his two superintendents are supported by six inspectors, twenty-one sergeants, and 210 constables. London, with its 2,500,000 inhabitants, has about 5,000 policemen, or 1 to every 500 souls. Copenhagen has only 1 to every 760.——The German Court-painter Lauchert, who was despatched to take the portrait of H.R.H. the Princess Alexandra, has now completed the work.—— The Danish manufacturers are highly gratified with the compliments they have received at the Great Exhibition, and the many sales they have effected. This is particularly the case with the porcelain works of Bing & Gröndahl. While the Exhibition was open they had a couple of thousand orders, and they still continue to receive fresh ones.——The first stone will soon be laid of the New English Episcopal Church, in Stockholm. It is to be in the English Gothic style, 80 feet long and 40 feet broad. The outside will be of dressed sandstone, but the interior will be faced with Swedish marble. —The Danish landowners, among other costly gifts to the Princess Alexandra on occasion of her marriage, will present her with a marble statue by Jerichau,—"Our First Parents before the Fall." Eve, suddenly sprung into being, is gazing wistfully on Adam, who sits on the earth, and on whose left arm she is reposing. The clay-model is now ready. The marble itself will be finished in a couple of years. As a state wedding-gift the Princess is to receive 100,000 Danish dollars, of which about 21,000 will be asked at the hands of Holstein, while the rest will be paid by the Danish realm.

FROM ANTIGUA.

THE first division of the new market at Antigua has been opened to the public, and has been attended with so much success that it is contemplated to complete the work immediately. It was opened with all due ceremony by the Governor Hamilton and authorities under a beautiful and impressive invocation from the Lord Bishop of the diocese. The people assembled outside the City of St. John, and walked in procession with the articles for sale on their heads, preceded by bands of music and flags: the building also was decorated with flags and the day was kept as a public holiday. St. Kitts has taken the initiative for the establishment of a market-house to supply a long existing want; and probably other colonies, profiting by their example, will carry out such necessary works, particularly as they have good sanitary and civilizing tendencies.

Under the new contract with the West India Packet Company it is intended to make Antigua the first port touched at by the Ocean Steamers, where all the mails will be left for the islands north and south, and they will proceed on to Jamaica, which, it is stated, is to be the head depôt. The mail service between England and the West Indies will thus be accelerated many hours, and trade and commerce be materially benefited.

The harbour of Falmouth, Antigua, has been surveyed, and found to have a sufficient depth of water. It has 70 acres with a depth exceeding 4 fathoms, and 200 acres with a depth exceeding 3 fathoms, which may be easily increased,—advantages which few of our British harbours possess. Some opposition to the change is threatened, as the picturesque situation and the many claims and allurements of St. Thomas have taken a deep hold on the minds of many individuals, immortalized as they have been by the graphic and sentimental pens of N. P. Willis and others; but I trust, says our correspondent, the British Government are not to be led away from a sense of public duty by the voice of such charmers, charm they ever so wisely. Besides Antigua is a British colony; and in the event of war the harbour could be effectually protected from the commanding heights of the ridges, Monk's Hill, &c.; and with a few guns of long range every approach could be vigorously defended. When the new routes of packets are established we shall shortly, perhaps, have the electric telegraph wires laid to connect the islands together, so that early information may be conveyed both for Government purposes and those of trade and commerce. The advantages to all would be inestimable.

MACADAMIZATION AND MUD.

THE justly-severe remarks upon the filthy state of the thoroughfares of the metropolis which have appeared in your pages from time to time, pass unheeded; and it seems as though nothing short of an indictment will rouse any of the authorities from their disgraceful apathy. I traverse a good portion of London daily, and I have no hesitation in saying, as I did a year ago, that whenever a rain-fall occurs unaccompanied by wind, bad as it is generally, in no locality is the mud deeper than between Cockspur-street and Westminster Bridge, at the threshold of the Metropolitan Board of Works and all the Government Offices. The mud is not scraped up sufficiently quickly to prevent its conveyance to the trottoirs by pedestrians; nor, when it is scraped to each side of a street, is it carted away with sufficient promptness; and therefore horses with broad feet, and vehicles of all kinds, splash it on to the pavement. Macadamization appears to me to be wholly unfitted for heavy and increasing traffic; but if this method of paving be continued, the nature and quality of the stone used should be most carefully investigated. I beg leave to suggest to the authorities, parochial, police, and ministerial, that every occupier of a house or shop be enjoined to have his or her portion of the pavement thoroughly cleaned by eight o'clock every morning; that paid crossing-sweepers, in some distinguishable dress, be placed at every required crossing, and that overseers be appointed to keep them up to their work; that the surface-drains (now nearly useless) be maintained in an efficient state, so that the liquid mud may flow off; that the streets be scraped early every morning; and that the contracting scavengers be compelled to remove the mud from each side without delay. The employment, at moderate wages, of many of those now idle and begging, would confer immense benefits upon the community, at a small comparative cost. IMPROVER.

DESTRUCTION OF THE THEATRE ROYAL, GLASGOW.

THIS building has been totally destroyed by fire. From the first discovery all hopes of saving any part of the theatre or properties were given up, and the exertions of the firemen were mainly used in preventing the fire from extending to the surrounding buildings. The flames in the theatre did not subside until almost nothing remained to burn. The walls were left standing, but the back one was found to be considerably off the perpendicular, and it was thought would have to be pulled down. The north one was found to be still more insecure. Theatres in Glasgow seem fated to destruction by fire. The Queen-street one was burned down: that of Anderson, the "Wizard of the North," shared the same fate: so did David Prince Miller's Adelphi Theatre; and now the Theatre Royal has been destroyed. The wardrobe, library, armoury, and "properties" generally of the Theatre Royal are said to have been the richest, most extensive, and most varied of any theatre out of London. The theatre was about 50 feet high, 50 feet broad, and 70 yards long. It was raised in the latter end of 1839, on the site of the old theatre, in consequence of the felt insufficiency of the then existing theatre accommodation.

Mr. J. H. Alexander was the proprietor.

The building and decorations, including site, were estimated at from 20,000*l.* to 30,000*l.* The property in it belonging to MRS. Glover is valued at from 8,000*l.* to 10,000*l.* The building is insured for 8,000*l.* Mrs. Glover's property is only insured for 3,000*l.*

THE LATE FATAL FIRE ACCIDENT AT THE PRINCESS'S THEATRE.

FROM the proceedings at the inquest on the poor little self-sacrificing ballet-girl, Miss Sarah Gibson, whose not very romantic theatrical name was Smith, it appears to have been from the sputterings of "blue fire" that the first accident, to Miss Hunt, occurred. Mr. Harris said that Miss Gibson prided herself on the expansion of her skirts; but it was evident that this had not much to do with the accident arising from her generous and successful endeavour to save the life of her companion. Moreover, Miss Gibson's interference at all would have been unnecessary had the theatre authorities provided beforehand the usual means and appliances in such cases; appliances whereby Miss Hunt's life had been saved on a previous occasion at the Surrey theatre. Mr. Roxby, who appeared with his arm in a sling, merits all praise for his gallant exertions.

Dr. Lankester's charge to the jury on this and other cases of accident to ladies by fire, contains remarks which merit reiterated quotation. It was most important, he observed, that attention should be directed to the character of the dresses which these young ladies wore, with a view to make them less inflammable; and not only should the same care apply to these young ladies, but to ladies in private life. It was a circumstance to be deeply regretted that fashion was carried out at the risk of life; and he wondered how many valuable lives would be sacrificed before they could find one woman who would give up the use of a certain article of dress, known to be so thoroughly dangerous. If the female sex would wear these outrageous dresses, care should be taken to render them uninflammable. There were several simple processes by which this could be accomplished; viz.,—phosphate of soda, tungstate of soda, and sulphate of ammonia: either of these would effect the object at a very small expense. Phosphate of soda was the cheapest, but that combined with tungstate of soda was the most effective. Out of 613 inquests which he had held since he had been coroner, 23 cases had arisen from burning, and 18 from clothes catching fire; and if they had been held in the same ratio throughout England, the jury would see how large a proportion there were in the country of persons who perished annually from this cause. He did hope, now their attention had been thus publicly aroused, that managers of theatres would insist that no dresses should be worn by their *corps de ballet* and others which were not rendered uninflammable by some of the processes he had mentioned, as they were bound to protect those employed by them from their present danger.

The jury ultimately returned a verdict "That Sarah Gibson, otherwise Smith, died from the effects of burns by the igniting of her dress at the Princess's Theatre with fire, and that such ignition was accidental." They then appended the following:—"The jury wish, also, to express their opinion that sufficient precautions were not taken at the Princess's Theatre to extinguish any accidental taking fire of the clothes of the *corps de ballet*. They also strongly urge the necessity of rendering articles of linen and cotton clothing fire-proof by the manufacturer and the undress."

The other sufferer is stated to be progressing favourably towards recovery, but is much affected by the fatal result to her less fortunate companion.

A hint as to what the sufferer should do when once on fire in a private dwelling will not be out of place. It is to ring the bell violently, if no one be present, and roll on the carpet. The flame will then rise from the body instead of up to it; and as half the poor creatures die from prostration, stimulants should be given instantly — either wine, brandy, sal volatile, or even, in some cases, laudanum diluted. Servants, too, should hasten to throw flour over the wounds till medical aid can be procured, and the things should be taken off, of course directly. For small burns, grease of any kind is a good application.

STAGE LIGHTS OF THEATRES.

AT the annual general assembly of the proprietors of Drury Lane Theatre, held last week, the architect of the proprietors, Mr. M. Nelson, said in his report:—

"The order given last season by the committee, to have every exposed gas burner throughout the building protected by a wire guard, has been most satisfactorily carried out. Formerly there were nearly 300 exposed gas lights: now every one has a wire globe around it, and the additional protection of a cover over the burner where necessary. The usual accidents arising from exposed gas burners cannot therefore take place, and even cotton or gauze may pass over gas lights so protected without danger.

As public attention is at this moment much directed to the subject of accidents by fire, I beg to refer to another precaution that has been adopted by order of the committee, viz, the introduction of hand-pumps. This simple contrivance consists of a common hand-pump in a bucket of water. These are distributed over the theatre, ready for use at any moment. The late Mr. Braidwood prized them so highly that no engine was allowed to leave its station without one; and numbers of fires have been extinguished by the brigade in using hand-pumps alone.

I cannot conclude my report without mentioning that the order of the committee, with reference to keeping open every door of public entrance and exit throughout the building during the performance, has been carried out to the fullest extent."

"I beg to add, that it may be of some public advantage to state the comparatively trifling cost of the precautions referred to that the committee have taken against accident by fire, the principle being applicable not only to theatres, but to every shop, warehouse, stable, and private house.

The expense of a galvanised wire globe, of the most useful form, is 2*s*. There is no reasonable limit to its durability; it cannot be broken, and never requires painting.

The tale covers cost from 6*d*. to 1*s*. each, and are as applicable to glass as to wire globes.

The wire guards and covers are as suitable to candles as to gas lights.

The cost of a hand-pump and pail of the best kind, with hose complete, is about 2½ guineas. No building of any description should be without one. It should be placed on the landing of every dwelling-house, and may be used by any maid-servant.

If all exposed lights and open fires were properly guarded, and a hand-pump provided, a large proportion of the accidents by fire would be prevented."

WORKMEN'S HALLS.

Southampton.—As we have before noted, there are three of these new institutions already established in Southampton. The first *soirée* in connexion with them has just been held at the new Hartley Institution under the presidency of the Earl of Carnarvon.

Wandsworth.—The inaugural meeting of the Wandsworth Working Men's Club was held last week. The proceedings commenced with a well-attended tea meeting held at the club-house, The Plain, Wandsworth, which was followed by a public meeting in the Spread Eagle Assembly-rooms. The chair was taken by Mr. G. F. White, who, after prayer had been offered by the Rev. Hugh Allen, D.D. (rector of St. George's, Southwark), gave an account of the circumstances connected with the formation of the club, and its objects and proposed mode of government. Mr. George Cruikshank then addressed the meeting in a forcible speech. Other speeches were also delivered. The club premises consist of a recently vacated public-house, containing the various rooms requisite for the purposes of the club, and with skittle-grounds, &c. attached. The lease was purchased by the liberality of ten gentlemen, each of whom lent 25*l*., without interest, to raise the amount needed. About 160 workmen have already enrolled themselves as members.

Scarborough.—A public meeting has been held in the Town-hall, Scarborough, for the purpose of forming a Working Men's Club. The chair was taken by Sir J. V. B. Johnstone, bart., M.P. The meeting was large and enthusiastic. A considerable sum of money was subscribed, and a provisional committee was appointed, with Mr. Tugwell as secretary. From the feelings manifested by the working men of Scarborough the club is considered certain to obtain several hundred members as soon as it gets into working order.

Faringdon.—A Working Men's Club was also formed lately at Faringdon under the auspices of the Working Men's Club and Institute Union. The Earl of Radnor and the local gentry generally subscribe liberally to its funds, and 200 working men have become members. So great is the success of the institution that it has outgrown the limits of the premises originally taken.

Miscellaneous.—It appears that upwards of 130 applications have been received by the committee from almost all the important towns in the country, including Liverpool, Ramsgate, and Cardiff, where halls are being formed on this model. Several of the railway companies have also taken a similar plan in hand.

THE RUINS IN THE STRAND.

THE pedestrian who traverses the ancient highway of the Strand in the month of January, 1863, will find that many changes have "come o'er the scene." From the days of the Maypole, the football, and the pastimes of old London, we have come suddenly into the midst of the frolics of the new; and wherever we go, whichever way we turn, gigantic railways, hotels, and music halls strike our eye. Three examples of these changes are pointed to by a writer in *Notes and Queries*; and we quote his remarks:—

Hungerford Market.—Upon its site once stood the palatial Hungerford House, the town residence of the Hungerfords of Farleigh Castle, Wiltshire, and the last of whose race, Sir Edward Hungerford, having squandered his fortune, obtained from Charles II. his royal charter for converting the site of the house and grounds into a market, and endeavour by this means to retrieve his fortune. This was in 1681. In 1685, Sir Stephen Fox and Sir Christopher Wren were proprietors of the estate, in the centre of which was a lofty hall, with a bust of one of the Hungerfords. But the market did not prosper: it remained till about thirty years ago, when Sir Thomas Tyrwhit, having set forth a project for rebuilding it in 1821, the second structure was commenced from the designs of Mr. Charles Fowler, upon the three acres and a quarter of ground, and was opened 2nd July, 1833, after costing 97,000*l*. This structure must be known to nearly all, and it therefore suffices to say, that the Market Company, after paying off in full the debentures and borrowed money, and returning to the shareholders 79 per cent. of their advances, sold the site of the market, as well as Brunel's Suspension Bridge, to the Charing-cross Railway Company, who thereupon, by means of public auction, sold the building materials, &c. of the hall (erected in 1851), the shops, with the stone columns, and surrounding houses in Villiers-street, Hungerford-street, and adjoining buildings, and upon the site commenced erecting (query) a railway terminus. It is this railway that has destroyed the happiness of, and sent adrift, St. Thomas's Hospital, and it is this railway that causes the fine bridge of Brunel's to be transported to Clifton.

Exeter Change.—The rise of the Strand Music Hall Company has caused the fall, not too soon, of Exeter Change. The site once occupied by the parsonage-house and garden of St. Martin's, and subsequently by the mansion of the Cecil family, was, in the reign of William and Mary, the scene of the erection of the first Exeter Change. Through troubled times, when the poet Gray and Lord Baltimore lay here in state; when Thomas Clark amassed here half a million, and Cross's Menagerie frightened horses in the Strand, Exeter Change struggled on, and it was not till 1829 that it was entirely destroyed; but on its site* was erected the well-known arcade, into which the jovial *Punch* oft paid a visit; and, lamenting on its deserted look, sounded a note about its ill-paying prospects. But its dozen shops continued deserted; its power of attraction had long fled; and when Messrs. Glasier & Son, on December 10, 1862, sold the building materials and fittings in 130 lots, for the purpose of clearing the ground for the Strand Music Hall, one and all firmly believed that a more profitable work would arise from its ashes.

Lyon's Inn.—Upon about half an acre of ground, and situate between Holywell, Wych, and Newcastle streets, Strand, has stood for hundreds of years Lyon's Inn, an inn of Chancery, an appendage to the Inner Temple. From the year 1420 to the year 1862, the site has been tenanted by those "learned in the law," although of late years these gentlemen have visited it but seldom; the last mortals on the spot clinging to the place with a despair brought on by long association with the secluded nook. Taking its name from the sign of an hostelry, "The Lyon," it, as an inn of Chancery, had for a reader, in 1578, none other than Sir Edward Coke. The hall was erected in 1700, and it had "once upon a time," many trees, and a sun-dial,—the latter shorn of its gnomon and figures in 1828. A very well-written article will be found on this subject in the *Illustrated London News* of December 27. But if Lyon's Inn is dead, a tablet to its memory remains, for in one of its attics was annually collected the materials for the "Post-office London Directory," when the size of that volume was not to be compared to the 2,574 pages of the Directory of to-day. And close handy lived Philip Absolem, the antiquary, who so ably assisted Mr. Brayley in his "History of Westminster Abbey." But the inn having decayed, the Strand Hotel Company (capital 100,000*l*.) took a lease of the ground for ninety-nine years, with power to purchase the freehold; and on December 2nd, 1862, and two following days, there were sold, in 284 lots, the furniture, fittings, and building materials of the hall, of Nos. 2 to 8, Lyon's Inn, and two houses in Holywell-street, being the first clearance sale; the carved stone lion, and the dated shield (1700) on the hall front, being included in lots 204 and 205. Thus has fallen Lyon's Inn!

T. C. N.

* This is not quite correct. Exeter Change was farther west, and in the Strand.—ED.

PLYMOUTH WESLEYAN CHAPEL COMPETITION.

SIR,—I send you a letter addressed by me as honorary secretary of the Alliance, to the managers of the Plymouth competition, and shall be obliged by your inserting it in the *Builder*:—

SIR,—I beg respectfully to call your attention to the conditions of the competition for a Wesleyan Chapel and Schools, which are in some respects unsatisfactory. I have the honour to be the honorary secretary of the Architectural Alliance, which includes Architectural Associations in every part of the United Kingdom, the great majority of architects being members; and as one of its principal objects is to discourage competitions of which the conditions are unsatisfactory, I am not incorrect in stating that as the conditions now stand, few, if any, respectable architects will compete.

I assume that your committee wish to do only what is regular and fair, and that if informed as to the objectionable conditions, they will not object to alter them. The objectionable conditions are, first, that more drawings are required than is usual or at all necessary, to clearly show a design. The necessary and usual drawings are,—Ground and gallery, or upper floor plans, two sections (one longitudinal and transverse), of each building, and two elevations (side and end) of each building. The plans of foundation and drainage and large scale sections of roofs, &c., and two additional elevations, are quite unnecessary to show the design, and would give much extra labour to competitors without any advantage to either them or the committee.

Secondly. A full and explicit specification is quite unusual and unnecessary. Such a document can only be properly prepared after all contract and detail drawings are finished. A brief description of the building mentioning the principal materials to be used would be quite sufficient, and all that is usual.

Thirdly, the *chief* objection to the conditions is to the clause requiring the architect to whom the premium is awarded to furnish all requisite working drawings, and specifications, &c., and conduct all correspondence for 50*l*. additional. I cannot but think that this must be an error, as it is practically requiring the architect to superintend the carrying out his design for one-fourth the proper commission. Assuming the premium of 50*l*. to pay for the "*design*," the proper and usual charge for performing the services above mentioned, with an occasional journey (for which of course travelling expenses are allowed), is 200*l*. additional to the premium, or 5 per cent. in all.

Fourthly. I would suggest that perspective drawings be allowed, if only in *outline*, and not as frames, as they show a design far better than any geometrical elevations can do.

Hoping that you will reconsider the above points, and issue fresh copies of the instructions, with the objectionable points erased, I have the honour, sir, to be, &c.

John Hill, esq., Plymouth. J. P. PRITCHETT.

The objections to the conditions sent forth in this case have already been fully shown in our pages, with our own opinion on the subject; but we insert the letter in compliance with the request of the writer. It will probably raise a question apart from the competition very properly objected to; but reference to this will be better made on another occasion.

THE METROPOLIS GAS ACT.

SIR,—As you have taken some interest in the gas question, especially as regards the metropolis, I have made up my mind to address a few observations to you on the subject of the Metropolis Gas Act, 1860, and the misrepresentation of which it has lately been the subject at recent meetings of the City Court of Sewers.

It may be necessary first of all to explain that the authorities of the City of London, for reasons best known to themselves, kept entirely aloof from, and took no part whatever in, the proceed-

ings, relative to the supply of gas to the metropolis, which took place in Parliament during the years 1858, 1859, and 1860. Had the City of London come forward in a manly, liberal spirit during the protracted inquiries of those years, extending as they did over four sessions of Parliament, it is possible that the Metropolis Gas Act might have been considerably modified, and the companies supplying the City prevented from raising their price from 4s. to 4s. 6d. per 1,000 feet. The committee sitting on the Metropolis Gas Bill would have heard the arguments of the City against the permissive rise of price, and the whole question would have been discussed as to the comparative value of the gas supplied in the City under the provisions of the Great Central Act and that which was to be supplied in future under the Metropolis Gas Act.

As there has been a great deal of misrepresentation on the subject of this change in illuminating power, I wish to explain in a few words the real nature of the change.

According to the Great Central Act, the illuminating power of the gas supplied before the passing of the Metropolis Gas Act was equivalent to $10\frac{1}{2}$ sperm candles, at a price of 4s. per 1,000 feet, or 4·57 pence per candle. The standard to which the gas has been raised is that of twelve sperm candles, for which the companies now insist on charging 4s. 6d. per 1,000 feet, being at the rate of 4·5 pence, or $4\frac{1}{2}$d. per candle. It is difficult to perceive how the consumers of the City are injured by this change, inasmuch as the gas required to produce a given amount of light absolutely costs less now than it did before the passing of the Act, and this notwithstanding the rise of 6d. per 1,000 feet in the price of the gas. Those who complained so loudly of the increased price forgot at the same time to notice the increased illuminating power, or, in other words, the increased value of the gas. So much for the facts. There is, however, another point of view from which this matter may be considered, and it is this:—Although twelve-candle gas is worth to the consumer 6d. a 1,000 feet more than gas of $10\frac{1}{2}$ candles, it by no means follows that it costs the company 6d. a 1,000 more to make the superior gas. The fact is, the extra expense to the company, as was proved abundantly before the Metropolis Gas Committee, is less than $1\frac{1}{2}$d. per 1,000 feet, or less than 1d. per candle. Hence the question becomes whether companies are really justified in charging an addition of more than *three halfpence per* 1,000 *feet* for supplying twelve-candle gas instead of $10\frac{1}{2}$. If the authorities of the city of London had come forward in a practical and business-like manner in support of this principle, we should never have heard of the recent rise in price, and we should have been spared the infliction of all that monstrous absurdity of statement which has characterized the speeches on this subject in the various City conclaves.

To return, however, to the more immediate subject of my letter. The City took no part in the Metropolis Gas Act; instructed no Parliamentary agents; appeared by no counsel; and in due course escaped payment of the miserable pittance levied rateably on other metropolitan parishes and districts for the expenses of the Act. Happy, fortunate, prudent City of London! But, in the midst of the congratulations which this splendid policy gave rise to, the City of London found, to its great surprise, that it had been caught in the meshes of the Act so far as to make the City liable to its provisions, although not liable for the expenses of procuring the Act. There is probably some anomaly in the co-existence of these conditions; but as this is a dry legal question, I do not at present discuss it.

The whole of the companies supplying the metropolis, finding themselves bound to supply 12-candle gas, and being allowed to raise the price, under certain easy conditions, where it did not exceed 4s. 6d. per 1,000 feet, those supplying the City availed themselves of the permission, and increased their price from 4s. to 4s. 6d.

But what has been the operation of the Act in other districts? The Imperial Company, supplying twice as much gas as all the three City companies put together, has had its standard raised from that specified in the Act of 1854 (the same as the old City standard) to the high standard of the Metropolis Gas Act, and yet has made no increased charge to its numerous customers.

It is not too much to assume that the illuminating power prescribed in the Acts of the Great Central and the Imperial companies was the ruling standard all over the metropolis. Now, the price has nowhere been raised except in the City, so that everywhere the consumer has gained an increase of light equal to 15 per cent., and may make a corresponding saving in his gas bills. Nay, the results go far beyond this, for in less than two years after the passing of the Act two large companies (the Phœnix and the South Metropolitan) have successfully reduced their prices, and with others will probably soon come to 4s., in compliance with the restrictions which limit their dividends. I have shown before that these large and sweeping reductions and this considerable increase of illuminating power when converted into a money value are equivalent to a clear boon of more than 200,000*l.* a year to the gas consumers of the metropolis; and I deny that the City of London has sustained any real injury from the Act, although the consumers there have certainly not reaped the same proportionate benefit as those in other parts of the metropolis. For this, however, they have only to blame themselves and their bad management. The City of London, however, has another great grievance, namely, the extortionate prices demanded by the gas companies for their public lamps. Nothing can be more unjust or unreasonable than the pertinacity with which this grievance is attributed to the Metropolis Gas Act. The Metropolis Gas Act is no more to blame for this than the man in the moon. It has nothing whatever to do with it, however it may serve the purpose of officials to shift the burden from their own shoulders, and to impute to others blame which should be laid on themselves. The Metropolis Gas Act, far from encouraging extortions on the part of gas companies, expressly restricts them, and affords adequate and easy means of meeting them.

Let the City authorities take the Metropolis Gas Act in their hand, and by way of illustration confine themselves to the public lighting clauses alone; see the admirable provisions for compelling companies to supply the lamps by meter; restrictions against charging more for public lights than the lowest price charged to any private consumer; and above all, the power given to local authorities, the Commissioners of Sewers amongst the number, of settling any disputes as to price or other matters by arbitration. By adopting this course, and exercising only an ordinary amount of patience and caution, they will avoid errors such as they have lately made; and they will find that the Metropolis Gas Act contains more useful provisions than any which have been secured for many years through the imperfect though costly legislation achieved by their own legal skill. Witness the failure of their last Parliamentary contest, when one of their own companies, the City of London Gas Company, was allowed to perpetuate the fearful nuisance of their works in the heart of the City under the very noses of the Templars, and to become, in a year or two later, one of the greatest stumbling-blocks in the way of carrying out that great public work, the Thames Embankment. Samuel Hughes.

CLAIM FOR COMPENSATION FOR DAMAGE BY CONTRACTORS' HOARDING.

ROBERTS *v.* BRASSEY AND OTHERS.—SHOPKEEPERS AND THE MAIN DRAINAGE WORKS.

This was an action (tried in Court of Exchequer, before Mr. Baron Bramwell), to recover compensation in damages for alleged injury done to the trade and business of the plaintiff by reason of a hoarding erected by the defendants, who are contractors for one of the sewers in connexion with the main drainage of the metropolis.

The defendants pleaded not guilty; and, secondly, that they were justified in constructing the hoarding under the Metropolitan Board of Works Act.

Mr. M. Chambers, Q.C., and Mr. Quain were counsel for plaintiff; and Mr. Coleridge, Q.C., and Mr. Welsby for the defendants.

The plaintiff was a clothier, carrying on a retail business in Shoreditch, at the corner of Church-street; and the defendants were the well-known contractors, who had contracted to make a main sewer from Clerkenwell to Old Ford. In May last the defendants commenced excavating the ground in Church-street, opposite the plaintiff's shop, and for the purpose of the works put up a hoarding which extended 14 feet into Shoreditch. It was 6 feet high, and extended over the footpath leaving only a space of 3 feet 6 inches between it and the shop front for passengers. Within the boards there was a steam-engine, a tramway, barrows, planks, and the usual plant of a sewer contractor. There was also a large heap of paving stones 15 feet in length, and 5 or 6 feet high immediately before the shop, and it covered a part of the pavement. In consequence of the hoarding being so near the shop, the plaintiff said persons could not stop to look at the window, where the goods were exhibited, without being run against and jostled by passers-by, and thus being compelled to walk on. The plaintiff also alleged that the hoarding was unnecessary, and negligently and improperly constructed, and had been kept up an unreasonable time, viz.—till September. He also said that during the Exhibition of 1851 his retail trade greatly increased owing to the number of country people who came to town by the Eastern Counties Railway, and that he anticipated a similar increase last year, but in consequence of these obstructions the business fell off, and he had sustained a heavy loss, which he estimated at more than 1,000*l.*

Mr. Coleridge, on the part of the defendants, characterised the action as unprecedented, and said if contractors carrying on works of this kind under the powers of an Act of Parliament were to be liable to an action by every single shopkeeper or householder in front of whose house it was necessary to erect a hoarding, great pubic improvements would be impossible. He contended that the works opposite the plaintiff's shop were conducted in the proper manner, and as speedily as possible, and that all unnecessary obstructions were avoided.

Evidence was then given to show that the hoarding was erected on the 17th of May, and cleared away on the 12th of July, when the roadway was reinstated; that the excavation was made in the proper way by means of "stages and lifts," and with every speed consistent with safety.

Mr. Joseph W. Bazalgette, the engineer in chief of the Metropolitan Board of Works, said he designed and superintended these drainage works, and that they had been executed entirely according to his plans. The excavation in Church-street was a very difficult piece of work, in consequence of the nature of the soil and the narrowness of the street, where the houses were badly built and the traffic very considerable. The hoarding was put up at the expense of the contractors, and they were required to construct it, on account of the cramped nature of the street, for the protection of the public. If there had been no hoarding, the paving stones and earth would have got on to the pavement and prevented persons passing freely. He added that the works were conducted in a proper manner and with proper speed, and that in such works it was necessary that the contractors should have all their materials on the ground.

The jury, without calling upon the judge to go over the evidence, found a verdict for the defendants.

THE ROUND TOWERS OF IRELAND.

In reference to the interesting paper in the *Builder* of January 31st upon this subject, those of your readers who have not access to the authorities quoted by Mr. Westropp may obtain some further insight into the subject by referring to the article "*Lanterne des Morts*," in M. Viollet le Duc's "Dict. Raisonné," in which some of these French structures are figured; which appear to corroborate Mr. Westropp's view of their analogy to the Irish round tower.

We have, as far as I am aware, nothing strictly analogous to these towers in England; but the assumed later development of the custom, as seen in the Cemetery Cross, is common in many parts of England. In Somersetshire these crosses are all but universal, either in the churchyard or in the high road near; and there are also remains of some of them erected in the high road far from any church or cemetery.

Can any of your archæological readers throw any light upon this subject from our own point of view? Were these crosses supposed to have any efficacy in laying the restless spirits of the departed? or were they merely open-air preaching-stations? Was their use associated with the church or with the cemetery? Any independent evidence touching the use of our own crosses would be valuable in confirming, or otherwise, the assumed relationship between the *Lanterne des Morts*, the round towers, and the cemetery crosses. J. F.

THE SURVEY OF NORTON PARISH.

A somewhat curious dispute has arisen as to this survey. On the 14th November, 1860, the guardians of Ecclesall Union contracted with Mr. Reuben Chapman, surveyor, to make a complete survey of the parish of Norton for a new assessment, and to deliver to the guardians a large sheet plan, with book of reference and smaller sectional plans to correspond, &c., for the sum of 9d. per statute acre, more or less, being 16*l.* The contract provided that the plans should be drawn "to the satisfaction of the Poor Law Board." The plans and book of reference were delivered in January, 1861; and some time afterwards, Mr. Chapman applied to the guardians for a payment on account. Although the plans had not then received the sanction of the Commissioners, the guardians consented to Mr. Chapman's application, and he received a cheque for 8*l.* The plans were sent up to London for approval, and the Commissioners requested the guardians to obtain Mr. Chapman's "field books," to test the accuracy of the plans. Mr. Chapman refused to send up these books, alleging that he had fulfilled every condition in the two schedules annexed to the contract; and that as the production of the field books was not mentioned in that document, he had a perfect right to refuse to accede to the request. The matter stood thus when the auditor drew up the payment made to Mr. Chapman, and surcharged the three guardians who had signed the cheque with the amount. The Commissioners, when applied to, said that the payment made was clearly illegal, because, by the terms of the contract, their approval was necessary before any money could be paid; but if the vestry would pass a resolution requesting them to relieve the three guardians, they would take the subject again into their consideration. A meeting has therefore been called and a resolution unanimously passed in favour of the suggested request. There the matter rests; but the meeting have also resolved that the guardians be empowered, in the event of Mr. Chapman adhering to his refusal to give up the field books, to have the accuracy of the maps tested by admeasurement on the ground. The mover said he had no doubt the plans were correct, and should have been very glad if Mr. Chapman would put an end to the dispute by giving up the books. The guardians are advised that if the plans be found to be inaccurate, Mr. Chapman must bear the expense of testing.

Miscellanea.

NEW MODE OF GENERATING STEAM. — An American gentleman, Mr. J. L. Linton, has lately visited Paris for the purpose of submitting to the French Government his new method of generating steam. Instead of the ordinary fuel, he uses petroleum oil; or, should that be wanting, ordinary coal oil; and as the machinery which he employs can be easily applied to the steam-engines in general use, he claims the merit of effecting a very considerable saving. The plan, according to *Galignani*, has been examined by a Government committee in Paris.

THE NEWCASTLE SCHOOL OF ART.—The award of prizes to the successful students at the Christmas Exhibition of this school has taken place in the school. The exhibition is considered a successful one. For architectural design there were two prizes of 1*l.* 10s. each, in money or books; one limited to architects or draughtsmen, the other for operatives or workmen. For the best design and drawings of plan, elevation and section of a villa two stories high, containing ten rooms, with bayed and dormer windows, and offices attached, not to cost more than 1,200*l.*, nor less than 1,000*l.*, Tudor style, with or without coloured perspective view. One of these prizes is the gift of a lady. It was given to Hubert Austin, of Newcastle. There was no competition for the workmen's prize.

DUNDEE CEMETERY PLANS.—The plans for the extensions at the Eastern Cemetery for Dundee, prepared by the Town's Architect and Mr. Fulton, have been open to inspection in the Council Hall. Mr. Fulton's design consists of a Gothic gateway, with a main carriage entrance, and two side entrances for foot passengers,—the houses on either side adjoining the gateway. The Town Architect's design is of a gateway which the local *Warder* says it cannot recognize as belonging to any of the regular orders of architecture, and seems better suited for a park or a pleasure ground than a cemetery. The houses are apart from the gateway, and thrown back, so that they are partially hidden by the fence; and the front, it is said, does not present the same imposing appearance as that in Mr. Fulton's design.

THE SEWAGE QUESTION AT WEST HAM.—The outlet for the sewage is into the river Lea, at Bow Creek, by permission of the commissioners of that river; and when first permitted, it was understood that the West Ham Local Board of Health would only be allowed for a temporary and not for a permanent period. Application has been made by the board for the purchase of the same; and if the intended purchaser was in attendance with a committee of the local board of health; but the question was deferred, as the matter was not entered on the usual notice paper. It is computed the cost of the pumping-engine, and the other expenses incidental to the outfall works, amount to little if anything less than 600*l.* per annum, or 12*l.* per week; and, therefore, any arrangement that could be made for the disposal of the sewage would at least effect a considerable saving.

COTTAGE HOSPITAL FOR EAST GRINSTEAD.—The advantages which cottage hospitals afford, in the treatment of accidents and severe diseases in rural districts, being now universally acknowledged; and the want of some such place in the neighbourhood of Grinstead having been frequently experienced; it is proposed to open one near the East Grinstead Railway Station. This hospital, which will be conducted on the plan so successful at Cranley, is not intended to supersede the projected Infirmary, but to serve as a temporary substitute. A cottage on East Grinstead Common, enlarged so as to obtain a room 28 feet by 12 feet, with proportionate height, and other accommodation, adapted for the reception in all of seven patients, and situate close to the residence of Dr. Henry Rogers, who is willing to give his professional services gratuitously, is offered by the gentleman rent free, on condition that a sufficient amount is contributed to pay for the fires and other requisites. About 120*l.* will be required. The furniture and all other property purchased or presented will be vested in trustees to be appointed from the contributors. The current expenses for nurses, medicines, fuel, and lights, will be defrayed by voluntary subscriptions and donations; but patients, or their employers or friends, except in very special cases, will pay for their maintenance: the hospital will thus be partially self-supporting. Donations and subscriptions may be paid to "The Cottage Hospital Fund," at Messrs. Whitfeld, Molineux, & Whitfeld's, East Grinstead, or to Dr. Rogers, to whom further particulars may be obtained.

CEMENTATION OF STEEL.—An invention has recently been patented by Mr. A. A. Lamiable, of Paris, according to which he claims the application of wood divided into small parts, such as sawdust, the leaves of trees, and the envelopes of certain fruits for the cementation of the pieces of cast or forged iron to form steel suitable for the manufacture of cutlery, rails, tyres of wheels, and other articles.

EXTRAORDINARY DISCOVERY IN THE FAST RIDING.—At Langton a ploughman has laid bare a portion of tesselated pavement in a field belonging to the Langton estates. The Rev. C. B. Norcliffe, of Langton Hall, and other gentlemen, have made an examination of the site, which is on the top of an eminence near the village. The result so far, it is said, has been the discovery of a fine pavement of pure white chalk-stone, composed of tesseræ about 1½ inch cube, set in cement or mortar. About 30 or 40 yards of foundation were traced to a huge block of sandstone, squared and pierced as if for the reception of a column. The inference is, that this formed the base of one side of the entrance to the court-yard of a Roman villa, or the portico of a temple. In the village adjoining there is a well-marked Roman camp, and on the wold there are extensive earthworks.

LECTURE BY TURKISH SAVANS AT CONSTANTINOPLE.—The lecture on chemistry lately in course of bi-weekly delivery at the Dar-il-Fanoum, Constantinople, by Dervish Pasha, attracted large and enthusiastic audiences. The lecture-theatre is comfortably fitted up *à la Européenne*, and the lecturer was amply provided with instruments, diagrams, and materials for experiment, all at the expense of the Turkish Government. At the conclusion of the series, the lecturer was to be followed by Salih Effendi, late president of the Pera municipality, who will deliver a course on natural history; and will be in his turn succeeded by Edhem Pasha, who will discourse on geology. "Shades of Amurath and Bayazid!" exclaims the *Levant Herald*, "can all this be taking place within the very shadow of St. Sophia?" It well may, however, at an epoch when a New Zealander is editing his own *Gazette* in his own native isle.

THE OTTOMAN NATIONAL EXHIBITION.—The building and its belongings continue to advance steadily towards completion. The applications for space in the machinery annexe are now so numerous that the commission has decided on enlarging this portion of their scheme to 5,500 square archins (about 4,280 yards). Amongst the articles said to be *en route* from the Babylonian capital is an immense pearl, reported to weigh no less than 335 *muscals* (about 500 drachms!), and to be valued by its owner, one Seropé, an Armenian, at the proportionate sum of 20,000*l.* This very precious jewel is said to have been fished in Ottoman waters in the Persian Gulf, and is to be offered—in sale—first to the Sultan, and if declined by his Majesty at the above figure, to be taken to England in search of a purchaser. The prices of admission are now fixed at 3p. for the general public on five days of the week, 6p. on Tuesdays for Turkish ladies, who will be exclusively admitted to the building on that day, and 6p. for the public again on Fridays.

GLASGOW ART-UNION. — The subscription for the past year amounted to 3,849*l.* 6s. The report read at the distribution said,—"Following up the design indicated by the committee in the report for last year, photographic reproductions of three original paintings have been prepared, and are in course of distribution amongst the subscribers of 1862. The commission for these paintings were undertaken by Messrs. J. Noel Paton, R.S.A., J. E. Millais, A.R.A., and James Sant, A.R.A.; and the paintings themselves form the three first prizes to be drawn for on this occasion. The prizes for the subscribers of 1862, selected by the committee, or to be selected by the prizeholders themselves, will number in all 250, or a proportion of one to each fourteen shares subscribed for. The sum appropriated for these prizes is 1,380*l.*, which added to the cost of the photographs, makes 2,530*l.* of the subscriptions of the year expended directly on works of art, and the total sum so expended by the society since its formation in 1841, 89,090*l.* The prizes are as follows:—1. The three paintings, the photographic reproductions which form the presentation work, being in value 105*l.* each. 2. Fifty paintings or other works of art, the selection of which will be in the option of the prizeholders. 3. 197 minor prizes, the selection of the committee, of the aggregate value of 365*l.* For the year 1863 the committee have in contemplation to extend the principle so favourably inaugurated this year of substituting photographs for engravings."

ARCHITECTURAL INSTITUTE OF SCOTLAND.—At the annual general meeting of the Architectural Institute of Scotland, held in the hall of the Institute, on Monday, the 2nd, letters were read from the secretary of the Architectural Alliance, and from the committee of the Institute of Architects in Ireland. The report of the council of management on the Bill of the Edinburgh Water Company, as affecting new buildings, was brought forward; and a paper by Mr. William Miller read, entitled "Some Remarks on Edinburgh, and its Improvement."

ACCIDENTS. —An accident attended with loss of life has occurred by the fall of a building in the Caledonian-road. Messrs. Gatti, the ice merchants, were constructing a depôt for their ice, and had sunk a shaft of 12 feet, over which was a building of some extent. Workmen were busy with the roof, when some iron supports gave way, and the men were precipitated down the shaft. One man, named Porter, was killed by the fall, and several others were severely bruised.——A newly-constructed house, at Worcester, erected on the site of some old premises in Friar-street, have fallen, owing to the foundation giving way. The house is one of several in course of erection; and the workmen were engaged in sinking cellars for two houses and shops which are to front the street, when the end house of four in the yard fell, and the labourers employed narrowly escaped with their lives.

THE LIVERPOOL TIMBER TRADE. — Mr. E. Chaloner, in his Annual Circular, states that the imports from Canada and America have decreased, whilst those from the Baltic are more than for the preceding year. This decrease is principally accounted for by the limited consumption at home, through the dulness of trade in our manufacturing districts, consequent upon the protracted civil war in America, combined with high rates of freight ruling, especially in the latter portion of the year, when a large amount of tonnage was required to transport grain to this country from Canada and the North American ports, and for the immense imports of cotton from India and other countries. The import of fir logs from the Baltic is much larger than that of the previous year. Mr. Chaloner in the following table contrasts the tonnage employed in the timber trade of this port with our colonies and the Baltic during last year with that of the previous one:—

From the 22nd January, 1862, to the 27th January, 1863.			
Quebec	120	vessels,	116,479 tons.
St. John, N.B, &c...	193	,,	142,362 ,,
Baltic	73	,,	23 831 ,,
Total	386	,,	292,672
From the 23rd January, 1861, to the 22nd January, 1862.			
Quebec	142	vessels,	134,597 tons.
St. John, N.B., &c...	237	,,	189,446 ,,
Baltic	66	,,	21,401 ,,
Total	445	,,	345,444

LECTURE BY CARDINAL WISEMAN AT THE ROYAL INSTITUTION.—The usual meeting at the Royal Institution, last week, was crowded to overflowing at a lecture by Cardinal Wiseman, "On the Points of Contact between Science and Art." He considered the subject in its relations separately to painting, sculpture, and architecture, each of which department of art, he remarked, is intimately connected with the progress of science. The first representative man in whom science and art were combined in the greatest perfection was Leonardo da Vinci; for, though little is generally known of that great artist's scientific acquirements, he wrote thirteen folio volumes on matters relating to science, and he had brought that knowledge to bear in executing his works of art. The man of modern times who had done most to connect science with art was the late Prince Consort, whom Cardinal Wiseman eulogised in high terms, and mentioned the many successful endeavours which had been made by the Prince to promote science in connexion with art. The relation between Scripture and science was illustrated by reference to the elliptical curves of which the form of the human body is composed; and Dr. Wiseman pointed out an analogy between these elliptical curves and the orbits in which the planets revolve round the sun. The study of anatomy, also, had been of eminent service to the sculptor. The relation between architecture and science, he observed, is so intimate, that the operations of the architect are entirely founded on a knowledge of the principles of mathematics. To illustrate the importance of the application of science to architecture, the lecturer explained, in considerable detail, the manner in which the dome of St. Peter's at Rome had been repaired when in danger of falling. The lecture was an hour longer than usual.

WESTMINSTER PALACE HOTEL.—The report of the Westminster Palace Hotel Company, presented at the half-yearly meeting, stated the receipts for the six months to have been 18,408*l.*, and the expenditure 11,999*l.*, leaving a net profit of 6,409*l.*, of which the sum available for dividend, after paying debenture interest, &c., was 5,620*l.* A distribution was accordingly recommended at the rate of 8 per cent. per annum, and 420*l.* was carried forward.

THE RUINS OF BABYLON.—A letter from Bagdad, in the *Moniteur*, says:—"The excavations carried on among the ruins of Babylon, under the direction of the French consul at Bagdad, have resulted in some interesting discoveries. In the Nimroud Mound, which was visited by Mr. Layard, in 1840, were found four bas-reliefs of colossal dimensions, each sculptured on a large slab of stone, with allegorical figures. The greater part of these bas-reliefs bear long inscriptions in cuneiform characters, and are remarkable for their state of preservation. A certain number of other sculptures of smaller dimensions, representing scenes of Assyrian life or warlike episodes have also been discovered. These artistic treasures are on their way to France."

TO PREVENT THE ROTTING OF WOODEN POSTS AND PILES.—The following receipt has been sent to the Société d'Encouragement, Paris. The paint, it is said, or varnish, has the hardness of stone, resists damp, and is very cheap. It has been in use for the last five years. 50 parts of resin, 40 parts of finely-powdered chalk, about 300 parts of fine hard sand, 4 parts of linseed oil, 1 part of red oxide of lead, and 1 part of sulphuric acid, are mixed together. The resin, chalk, sand, and linseed oil are heated together in an iron boiler: the red lead and the sulphuric acid are then added. They are carefully mixed, and the composition is applied while hot. If it be not found sufficiently fluid, it may be made thinner by adding linseed oil. This paint, when cold and dry, forms a varnish of the hardness of stone.

SANITARY CONDITION OF THE CITY OF LONDON. Dr. Letheby, the medical officer to the City Sewers Commission, has presented his annual report on the sanitary condition of the City. It states that "in the course of the year which has expired there were 3,046 births, 2,726 deaths, and 1,540 marriages in the city of London. These occurred among a population of 114,472 persons. The births, therefore, have been in proportion of 26·4 for every 1,000 of the inhabitants; the deaths of 23·8; and the marriages of 13·4. In all England the average birth-rate is 33·1 per 1,000 of the population, the death-rate 22·3, and the marriage-rate 8·2." The distribution of the deaths has been very unequal: in the eastern and western unions the general proportions have been at the rate of 25·8 per 1,000 of the population, whereas in the central district it has been but 20·6. The cause of this has been, not so much the difference in the character of the population, as the density of it. In the former districts the number of persons upon an acre ranges from 200 to 266, whereas in the latter the number is but 105. The infant mortality in the City is unquestionably very large. It can hardly be estimated by the proportion of children's deaths to the total mortality, because the proportion of children in the City population is comparatively small, but it may be seen by observing the number of children that die before they are a year old. Last year there were 3,046 births in the City, and there were 475 deaths of infants that had not reached the first year of their age. In the course of the last ten years the annual proportion of births had been 3,412, and the annual proportion of infant deaths has been 556. This is at the rate of 16 per cent., or, in other words, 1 in 6 of all the children born in the City die before they are a year old. In the rest of London the proportion is about 15 per cent., and in all England it is only 14 per cent., or about 1 in 7. The causes of this are chiefly to be found in the density of the population, and the bad condition of the homes of the poor. The means of storing water and the appliances for distributing it are so defective in the poor localities of the City that there are constant complaints of a deficiency of water. Indeed, the water is on for so short a time in many districts that the poor have but little opportunity for collecting it. From a quarter of an hour to an hour is too short a time for filling butts and cisterns; and, therefore, during the greater part of every day they are without water: on Sundays they are nearly always without it. This is a subject we have ere now brought under notice. It would be a great boon if the daily supply were continued for an hour instead of half an hour, and if there were a like supply on Sundays.

M'INTOSH *versus* THE GREAT WESTERN RAILWAY.—In the cause of Mr. M'Intosh, the contractor, against the Great Western Railway Company, which has been in litigation for several years, the chief clerk of the Vice-Chancellor Stuart, before whom the accounts have been, has now terminated his investigation; and it is understood that the amount of the plaintiff's claim is found to be, in round numbers, 80,000*l.*, with interest from the opening of the line, in 1838 or 1840. The costs of the suit will probably amount to a further sum of 20,000*l.* There is another suit of a similar character between the same parties, the accounts in which have not yet been entered on.

CHATHAM.—In order to provide healthful recreation for the troops stationed at this garrison, the War-office authorities have decided upon the erection of an extensive gymnasium for their use. The spot selected as the site of the building is that portion of the inner lines nearest to the drawbridge, leading to New Brompton. The contract of Mr. Matthews, of Dover, for 3,500*l.*, has been accepted.——The foundation of the memorial arch erected about eighteen months ago at the eastern end of the parade ground, Brompton Barracks, to the memory of the Royal Engineers who fell during the Crimean war, has, according to the *Morning Post*, been gradually giving way for some time past, and the structure is now in such a state as to demand immediate steps for its preservation.

ST. THOMAS'S HOSPITAL.—A Surrey magistrate, an old supporter of the London Hospital, offers to "give" a freehold site of 73 acres for the new Hospital of Bethlehem, on condition, first, that St. Thomas's Hospital be built on the site of Bethlehem; and, secondly, that the sum of 21,000*l.* (20,000 guineas) be added to the capital stock of the London Hospital, in the Whitechapel-road. The estate (which is freehold, land-tax redeemed), occupies the southern slope of one of the hills in Surrey, is eight miles from the City and seven from the West-end, and is said to be worth at least 300*l.* per acre. After all, therefore, the offer, so far as St. Thomas's is concerned, is to *sell* a site.

LECTURE ON ARCHITECTURE AT LEEK.—A lecture, one of a series promoted by the vicar, was lately given by Mr. R. Edgar, of London, architect, in the national school at Leek. His subject was, "Ecclesiastical Architecture," which he treated in its Gothic branch only; showing how our English Gothic had grown up a school out of the character and necessities of our northern climate; and tracing its rise and growth to its culmination in the period of the Perpendicular Gothic, and its decline in the sixteenth and seventeenth centuries. He also gave some hints on the spirit in which he considered that a revival should be attempted. The lecture was illustrated by a number of sketches, many of which Mr. Edgar drew before the audience.

THE WEDGWOOD STATUE.—A correspondent of the *Staffordshire Advertiser* says:—I was passing through the Railway-square at Stoke the other day, when what I suppose to be the pedestal of the long-looked-for Wedgwood-in-bronze attracted my attention. On closely approaching the work I was not a little astonished to see that the material employed is of no more durable a nature than *red sandstone*..... Perhaps the eminent sculptor wants the particular colour for the work: need he be reminded that there is abundance of granite that will give it him? Perhaps the amount to be paid for the work will not allow of the use of this material. If not, it is hard to believe that the subscribers will on this occasion "spoil the ship for a ha'porth of tar."

TRANSMISSION OF LETTERS.—A curious project has been set on foot by M. Faget, of Bordeaux. He proposes to erect, at a distance of about 1,000 mètres from the coasts of Calais and Dover, two strong edifices of masonry, containing steam-engines of sufficient power, by means of which two immense wheels, 25 mètres each in diameter, are to be made to turn forty times a minute. By this rotation a series of wires, forming a gigantic strap extending across the Channel, is to be coiled round the wheel at one end, say at Dover, and uncoiled at the other, Calais, and conversely. To this strap india-rubber letter-bags are to be attached, which are thus to be conveyed across the Channel at the rate of 3,000 mètres per minute; so that within the space of twelve minutes the letters and despatches from one country may be landed on the other. The length alone of the strap is sufficient to cause its submersion, and the transmission might be effected in any weather. But what of the navigation of the Channel, especially on the coasts?

DAMAGE TO CHRIST CHURCH, BATH.—The north-east pinnacle of the tower of Christ Church, Bath, has been blown down by the violence of the wind; and, falling through the roof, has destroyed a portion of the flooring of the gallery; falling into the body of the church. The organ had a narrow escape, the moulding of one part of the case being carried away by the falling stone.

IPSWICH.—The new weir, which has been constructed at the expense of the Ipswich corporation, with the design of preventing the flooding of the Marshes belonging to them, is now available for carrying off from the Gipping the storm water, &c., which hitherto, from want of a legitimate mode of escape, has poured over the meadows and marsh lands adjoining. The weir is formed on the south bank of the Gipping, just at the last bend the river takes before it is crossed by Handford Bridge, from which bridge the weir is about 250 yards distant. The weir is the edge of a "tumbling bay," and presents a surface of 140 feet to the river. To form this the earth was excavated to a depth of 7 feet, and a gradual hollowed slope formed of concrete, over which is brickwork 18 inches thick in the weakest part, and at the sides 3 feet in thickness; its shape resembling a long spoon with a blunt rounded point, the end which should join the handle being cut off square. The edge is formed of blocks of "Roach Portland" stone 3 feet deep and 2 feet in thickness, over which the water will run in case of any rise in the river. The tumbling bay is 62 feet in length and 42 feet wide. From hence the water runs into a channel, for a distance of 150 feet filled in with concrete, communicating with the old channel, which has been enlarged, leading into the tidal river through the Seven Arches. For some distance the banks of the river have been raised. The works were according to a plan by Mr. W. H. Holland, C.E., of London, and have been executed under the direction of Mr. Monson, engineer, by Mr. R. Worswick, whose contract was for 897*l.*; and the extras will, probably, bring the cost of the works to something over 1,000*l.*

TENDERS.

For alterations and additions to Beddington House, Surrey, for the Rev. A. H. Bridges. Mr. Joseph Clarke, architect:—

Conder (accepted)	£5,295 0 0

For the oak seats, East Peckham Church, Kent. Mr. Joseph Clarke, architect.

C. W. & J. Bowley (accepted)	£418 0 0

For building the first portion of the Hampden Gurney Memorial Schools, Adam-mews, Berkeley-street, W. Mr. Joseph Clarke, architect:—

Aldred & Doulton	£3,256 0 0
Ashby & Son	3,256 0 0
Foster	3,220 0 0
Conder	3,171 0 0
Gammon	3,065 0 0
Key & Head	3,044 0 0
Norton	2,948 14 0
Lawrence & Son	2,931 0 0
Piper & Wheeler	2,897 0 0
D'Anson	2,844 0 0
Trollop & Son	2,826 13 0
Brown & Robinson	2,810 0 0
Bowley, Brothers	2,7 0 0 0
Carr	2,688 0 0

For new warehouse buildings in Long-lane, Bermondsey, for Messrs. Gibbs & Son. Mr. Geo. Elkington, architect. Quantities supplied by Mr. Herring:—

Nixon	£3,360 0 0
Lugg	3,115 0 0
Wills	2,764 0 0
Coleman	2,730 0 0
Peake	2,700 0 0
Thompson	2,692 0 0
Wood & Munn	2,649 0 0
Kent	2,626 0 0
Wells	2,599 0 0
Preston (accepted)	2,532 0 0

For building two villa residences at Hackney, for Mr. Kelsey. Mr. Chester Cheston, architect:—

Goodwin	£3,668 4 0
George	3,377 0 0
Flint	3,256 0 0
Stevenson	3,057 0 0
Perry	2,799 0 0
Bond	2,740 0 0
Aldous	2,720 0 0
James & Ashton	2,693 0 0
Meers	2,666 0 0
East	2,470 0 0
Cubitt	2,324 0 0

For fitting up public house at Kingsland. Mr. Cass A. Long, architect:—

	Bars, Fittings, &c.	Counter.	Gas-Fitting
Skinner, Brothers	£310 0 0		
Lidbetter	232 0 0		
Scott	231 10 0		
Saunders	....	£89 10 0	
Gerardin & Watson	....	86 5 0	
Warne	....	89 0 0	
Bird	....	....	£37 0

For building new parochial and industrial schools, and mistress's residence, at Lymm, Cheshire. Mr. Joseph Clarke, architect:—

Parker	£1,870	0	0
J. Bramall	1,440	0	0
S. Bramall	1,349	0	0
Pennington	1,259	11	9
T. & J. Ardern	1,250	0	0
Brazendale & Son	1,248	0	0

TO CORRESPONDENTS.

Doubtful if license be needed for that purpose).—R. L.—J. S. Poor Will ("shingles" are usually of oak, from 8 inches to 12 inches long and 4 inches broad; rather thicker on one edge than the other).—W. H.—G. P. (finds ill-feeling where none is felt or expressed).—T. D.—W. D.—Mr. E. W. E. F. (see the Clerk of Works' Society).—W. A.—T. B. P.—R. & Sons.—B. S. (sent).

A Subscriber (names were illegible, and therefore omitted).

NOW READY, and may be had at the Office, the TWENTIETH VOLUME of "THE BUILDER" (bound), for the year 1862, price One Guinea.

CLOTH CASES for binding the Numbers, price Two Shillings and Ninepence. Also a COLOURED TITLE-PAGE, Gratis

SUBSCRIBERS' VOLUMES will be bound on being sent to the Office, at a cost of Four Shillings each.

ALLEGED SECOND-HAND SAFES.—Any person or persons having recently purchased, from furniture brokers or dealers in second-hand fire-proof safes, any such safes which were stated to be of Chubb's make, will oblige by communicating with Messrs. Robinson & Hine Haycock, No. 32, Charterhouse-square, solicitors to Messrs. Chubb & Son.—[Advt.]

ADVERTISEMENTS.

GEOMETRICAL DRAWING FOR MILITARY STUDENTS
Part I. New Edition in preparation with Plates, price 4s. 6d.

ELEMENTARY GEOMETRICAL DRAWING, including Practical Plane Geometry, the Construction of Scales, the use of the Sector, the Marquois Scales, and the Protractor.
By S. H. WINTER, F.R.A.S.

WINTER'S ELEMENTARY GEOMETRICAL DRAWING. Part II. The Elements of Descriptive Geometry, with its Application to Horizontal and Isometric Projection, and the Projection of Solids and Shadows. *Preparing.*
London: LONGMAN, GREEN, & CO. 14, Ludgate-hill.

On Saturday, February 28, will be published, Part I. in 8vo. price 5s. sewed,

A DICTIONARY of CHEMISTRY, founded on that of the late Dr. Ure.
By HENRY WATTS, B.A. F.C.S.
To be continued Monthly, and completed in 16 Parts, forming 3 Volumes, uniform with the New Edition of Dr. Ure's "Dictionary of Arts, Manufactures, and Mines," recently completed.
London: LONGMAN, GREEN, & CO. 14, Ludgate-hill.

In 12mo with Diagrams and Figures, price 2s. 6d.

LAND SURVEYING and LEVELLING, arranged and simplified for the use of Private Students and Engineering Schools, and for Gentlemen and Engineers going out to India or into the Colonial Service
By ROBERT THORNTON, Civil and Principal Engineer
London: LONGMAN, GREEN, & CO. 14, Ludgate-hill.

New Edition, with 89 Woodcuts, in fcp. 8vo price 6s.

CATECHISM of the STEAM ENGINE, in its various Applications to Mines, Mills, Steam Navigation, Railways, and Agriculture. With Practical Instructions for the Management and Management of Engines of every class.
By JOHN BOURNE, C.E. Author of "The Artisan Club's Treatise on the Steam Engine,"

of which the Fifth Edition, greatly enlarged, with 37 Plates and 546 Woodcuts, may now be had in a fcp. price 12s.

"This reproduction of the Artisan Club's Treatise on the Steam Engine contains so many additions and emendations as to render the work substantially a new one."—*Mechanic's Magazine.*

"As a treatise for practical men, this work is as near perfection as any that has yet been published, and will doubtless long maintain the high reputation which its acknowledged merits have secured for it."—*Mining Journal*

London: LONGMAN, GREEN, & CO. 14, Ludgate-hill.

NEW EDITION OF WOOD'S ALGEBRA, BY LUND.
The Sixteenth Edition, in 8vo. price 6s. cloth,

WOOD'S ELEMENTS of ALGEBRA, for the Use of Students in the University of Cambridge. A new Edition, revised and improved by the Rev. THOMAS LUND, B.D. late Fellow and Sadlerian Lecturer of St. John's College, Cambridge.

LUND'S COMPANION to WOOD'S ALGEBRA, 7s. 6d.

LUND'S KEY to WOOD'S ALGEBRA, 7s. 6d.
London: LONGMAN, GREEN, & CO. 14, Ludgate-hill.

THOMAS TATE'S SCHOOL ALGEBRA, ARITHMETIC, GEOMETRY, &c.
New Edition, in 12mo. price 2s.; KEY, now ready, price 3s. 6d.

ALGEBRA made EASY. Chiefly intended for the Use of Schools.
By THOMAS TATE, F.R.A.S.
Late of Kneller Training College, Twickenham.
By the same Author, revised Editions,

TREATISE on the FIRST PRINCIPLES of ARITHMETIC, after Pestalozzi's Method, with many Examples, 1s. 6d.

Ten parts at 3s. or in boards, 36s.; containing upwards of 120 Steel Plates, and numerous Wood-cuts Diagrams.

2. PETER NICHOLSON'S PRACTICAL MASONRY, BRICKLAYING, and PLASTERING (revised by TREDGOLD), both plain and ornamental; containing a new and complete System of Lines for Stone Cutting, for the Use of Workmen; the Formation of Mortars, Cements, Concrete, to which is added a variety of new designs for Mural Tablets, Tombs, Gravestones for Cemeteries, &c. &c.; and a description of the various materials employed. Ten Parts at 3s. or in boards, 30s.; containing upwards of Ninety Steel Plates and 150 various Wood-cuts.

3. TREDGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS of ARCHITECTURE: containing plain and simple Rules for Drawing and Executing them in the purest style; including an historical Description of Gothic Architecture. Illustrated by upwards of One Hundred fine Engravings, executed by Art six of first-rate talent, including numerous Diagrams, &c. Twelve parts at 3s.; or in boards, 36s.

4. DESIGNS for COTTAGE and VILLA ARCHITECTURE, containing Plans, Elevations, Sections, Perspective Views, and Details, for the Erection of Cottages and Villas. By S. H. ROBINS, Architect. Beautifully engraved on steel. Ten Parts, at 3s. or 30s. boards.

5. DESIGNS for PUBLIC BUILDINGS, consisting of Plans, Elevations, Sections, Perspective Views and Details of Churches, Chapels, Schools, Almshouses, Gas Works, Markets, and other buildings for public purposes. By E. B. BROOKS, Architect. Beautifully engraved on steel. Ten Parts, at 3s. or 30s. boards.

6. THE HOUSE DECORATOR and PAINTER'S GUIDE: containing a series of Designs for Decorating Apartments with taste, and suited to the various styles of Architecture. By H. W. and A. ARROWSMITH, House Decorators to her Majesty. Ten Parts, at 2s.; or in boards, 22s.

7. THE HOUSE PAINTER, or DECORATOR'S COMPANION: containing a complete Treatise on the Art of House Painting, Graining, and Marbling; including the Origin of Colour, the Laws of Harmonious Colouring, the Manufacture of Pigments, Oils, Varnishes, &c. By W. M. HIGGINS, Esq. Accompanied by actual Specimens of Hard Brush Graining and Marbling. Ten Parts, at 3s.; or in boards, 33s.

8. THE ENGINEERS' and MECHANICS' ENCYCLOPEDIA, a new and enlarged edition, comprehending Practical Illustrations of the Machinery and Processes employed in every description of Manufacture of the British Empire. Illustrated by upwards of 2,000 Wood-engravings. By LUKE HERBERT, Civil Engineer, &c. The rapid progress of Mechanical Science has developed many of the important facts since the first publication, in 1836, of the Encyclopædia. The Inventions and Discoveries recently made have encased the sedulous attention of the Editor; for, as the value of each was tested by experiment, a description was accordingly prepared. By the selection of new articles, and care in treatment, the present edition has now become scientifically enriched; so that Many be received as new and matter, even assuming "the existing state of Engineering and Mechanism, adapted to the wants of Practical Men." In two large 8vo volumes, cloth lettered, price 30s.

Just published, Part I containing Five Plates, imp. 4to. price 5s.

OCTAVIUS N. SIMPSON, STAMFORD;
and see Specimens at the Office of
Messrs PINDER SIMPSON & SONS, 29, Savile row, London, and at the Museum of Practical Geology, Jermyn-street, W
This stone (which is a perfect oolite), is raised in blocks of any particular size, and is about four feet thick in the bed. It will stand ANY WEATHER, is much used for water-works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the kingdom.

TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION.
MAGNUS'S ENAMELLED SLATE obtained the Medal of the Society of Arts, the Prize Medal at the Great Exhibition, 1851, Two First-class Medals at the Paris Exhibition, and Two Prize Medals at the International Exhibition of 1862
Truthful imitations of this beautiful material are being palmed upon the public. Architects are therefore requested to see that the name of "MAGNUS" is upon each article.

HAY'S PATENT WATERPROOF GLUE and INDIA RUBBER VARNISH TO ARCHITECTS, BUILDERS, PAPER-HANGERS, &c. &c.—The WATER-PROOF GLUE is a species sui generis, and is suitable for Contractors, Joiners, Cabinet makers, &c. &c. The varnish for damp walls, previous to papering, coating zinc verandahs, &c &c. Copy of a letter from Messrs. Rogers & Booth, contractors, Gosport:—
"We have repeatedly used your Waterproof Glue as a preventive against damp, and have found it most valuable in preparing walls to receive paper. In one instance, where the walls were thoroughly saturated with moisture from earth filled against the outside, we used it for varnish internally, and papered the surface, within a few hours of its being applied, with complete success. We have also used your preparation for coating a large number of cement pales, at the Dunwhich, Portsea, for her Majesty's War Department."
To be had from all Ironmongers, Oil and Colourmen, &c
Manufactory, Chandos street, Portsmouth Mr GEORGE WEEKS, Manager GEORGE C. WARREN & CO. General Agents, 12, London-street, London, E.C. where specimens of its application can be seen.

PAPIER MACHE AND CARTON PIERRE WORKS,
49, RATHBONE PLACE, W.
GEORGE JACKSON AND SONS
(Established in 1760)

Beg the attention of Architects, Builders Decorators, and the trade in general, to their large assortment of Enrichments for Ceilings and Cornices, in the Gothic Elizabethan, Italian, Renaissance, Louis XIV. XV. XVI and many other styles; also rich or simple Panel Decorations, Elizabethan and Gothic Dados, Door Caps, Mouldings of all sizes, and to their varied selection of Centre Flowers for Ceilings, Gothic Bosses, Trusses, Column and Pilaster Caps, all executed in the highest style of art.

The large and lengthened experience of GEORGE JACKSON and SONS in decorations of Drawing and Dining Rooms, Libraries, &c. for private houses, or public buildings, many of which they have had the honour of executing under Architects of the highest eminence, enables them with confidence to direct notice to that branch of their business.

Upholsterers are invited to inspect the large variety of Glass Frames, Tables, Cornices, Screens, Candelabra, &c. The large extent of their works, and the recent adoption of steam power and machinery, enable them to offer very superior advantages in materials and speed, while for design, beauty, relief, and finish, they flatter themselves they stand unrivalled.

DESIGNS MADE FOR ANY WORKS.

CHEAP, LIGHT, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.—2nd. It is portable, being packed in rolls, and not liable to damage in carriage.—3rd. It effects a saving of half the timber usually required.—4th. It can be easily applied by any unpractised person.—5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.—6th. Under slate, metal, or tiles, it is a most effective non-conductor.

INODOROUS FELT, for damp walls and for damp floors, under carpets and floor cloths. Price ONE PENNY per Square Foot.

INTERNATIONAL EXHIBITION, 1862.

CLASS 35, NO. 6849.

3s. 9d.

The ONLY MEDAL "for STONEWARE" has been awarded to DOULTON & WATTS, LAMBETH POTTERY, LONDON.

In expectation of a greatly increased sale, D. & W. have determined to introduce the improved pattern of their ENAMELLED STONEWARE CLOSET-PANS, at the price of the commonest description of earthenware.

Experience has shown that this shape is the most simple and efficient, and that in strength, durability, and cleanliness, it cannot be surpassed by the most expensive closets.

Baths can be had of either Copper, Zinc, or Galvanized Iron Price, from 30s. 10s. each. J. W. & SONS also supply all Fittings requisite for the same.

TWO PRIZE MEDALS FOR BELLS HAVE BEEN AWARDED TO JOHN WARNER and SONS, AT THE GREAT EXHIBITIONS IN 1851 AND 1862.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c. cast of any size, note, or weight, singly or in Peals.

TUNED BY MACHINERY.

Old Bells recast or taken in Exchange.

An experienced Bell hanger sent to inspect, report, and advise on the state of Peals out of repair. Estimates furnished for New Oak Frames and Fittings, and for Repairing Old Ones

House Bells, Hand Bells, Alarm Bells, Ships' Bells, Horse, Cattle, and Sheep Bells,

No. 384. No. 383.

WARNERS' HIGH-PRESSURE COCKS

are made with Gland Stuffing-boxes and Loose Valves. They can always be made sound after wear, and refastened with facility.

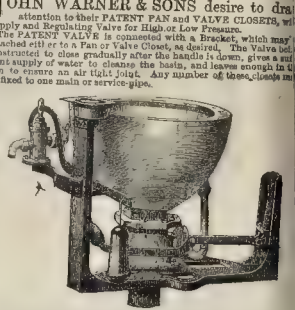
All Warners' Cocks are tested with Hydraulic Pressure

Improved large Screw-down Cocks, suitable for either Steam or Water, are recommended to the notice of Water Companies as an efficient substitute for the ordinary Sluice Cock.

JOHN WARNER & SONS

HAVE BEEN AWARDED A PRIZE MEDAL FOR THEIR NEW

CHIMING APPARATUS,



by means of which a lad may correctly play a great variety of chimes upon peals of six, eight, or more bells. Several have since been fixed, and give great satisfaction.

Prices and further particulars furnished on application at the Manufactory, 8, Crescent, Cripplegate, London.

JOHN WARNER & SONS desire to dra

attention to their PATENT PAN and VALVE CLOSETS, wi
Supply and Regulating Valve for High or Low Pressure.

The PATENT VALVE is connected with a Bracket, which may attached either to a Pan or Valve Closet, as desired. The Valve be constructed to close gradually after the handle is drawn, gives a su cient supply of water to cleanse the basin, and leaves enough in t pan to ensure an air tight joint. Any number of these closets m be fixed to one main or service-pipe.

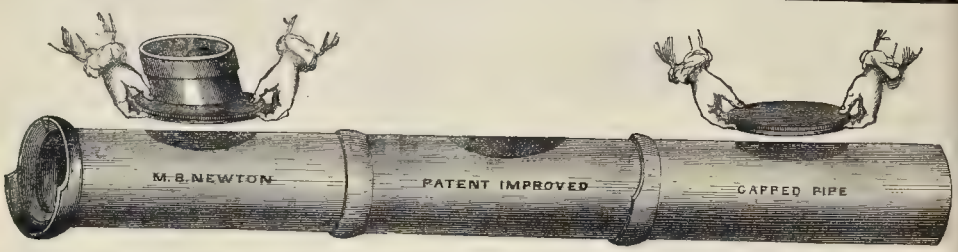
Sunk Handle, extra 0 3 0
Blue Basin, extra 1 1 0



No. 1434.—Warners' Bright Pan Closet, with Patent Supply and Regulating Valve attached, Plain Handle, and White Basin £2 0 0
Sunk Handle, extra 0 2 0
Blue Basin, extra 0 1 0

The above prices are subject to a liberal discount.

THE ABOVE ARE WHOLESALE PRICES, SUBJECT TO DISCOUNT.

JOHN WARNER & SONS, 8, CRESCENT, CRIPPLEGATE, LONDON, E.C.

The ABOVE INVENTION WILL RECOMMEND ITSELF to Architects, Engineers, and others interested in Drainage, for its SIMPLICITY of construction; there being NO COMPLICATION OF PARTS.

The "Manhole" is sufficiently large to admit of the DRAIN being THOROUGHLY CLEANSED WITHOUT A SINGLE PIPE BEING REMOVED.

It DOES NOT at all INTERFERE WITH THE FLOW OF WATER in the Drain.

It IN NOWISE WEAKENS THE PIPE; and

It ADMITS of the ready INSERTION OF A JUNCTION by removing the "Manhole" cover, and replacing it with a loose Junction Arm.

Manufactured solely by

Lee & Bowdel, with instructions to SELL by AUCTION, on THURSDAY, FEBRUARY 19 1863 at ELEVEN for TWELVE o'clock precisely (and on the following day, should the number of lots render it necessary), on the WHARF and PREMISES, as above, Two Gwynne's Patent Centrifugal Pumps, timber drums, whims, forty earth-waggons, chain, wrought, and cast iron, inch spring cart, four good hack horses, a large quantity of temporary sleepers, rolling board, block boxes, round timber, the square, and other useful wood, stacks of firewood, &c; stone, Staffordshire blue and other bricks, besides a valuable and numerous collection of contractor's plant and miscellaneous effects. May be viewed the day preceding and morning of Sale. Catalogues had of J. J. BENNETT, Esq. 4, Hyde-terrace, New Cross; at The Kent-sh Drovers, and Hawser Arms, Peckham; The Railway Tavern, New Cross; The Roebuck, Lewisham; at the principal Inns in the neighbourhood of the Wharf; and of the Auctioneer, New Cross-road, Kent.

PHILBROKE ESTATE, at Leytonstone, on the Woodford and Loughton Railway, twenty minutes from Fenchurch and Bishopsgate Stations.—This valuable FREEHOLD ESTATE (land tax redeemed), surrounding the Station, healthy locality, gravelly soil, excellent drainage, water and gas laid down, roads nearly made, and let by FRED. SMALL, Esq. Philbroke, will be LET in Plots suitable for building detached and semi-detached villas. Repeated applications have been made for houses in this neighbourhood For terms, apply to Mr. ATHEY, at the Surveyor's Office, Philbroke Estate, Leytonstone, Essex

BUSHY PARK ESTATE, Teddington.—TO BE LET, or SOLD, the Remaining Portion of a BUILDING ESTATE, of 75 Acres, in the Occupation of Mr. Knight, with frontage on main roads overlooking Bushy Park, five minutes' walk from the Station on the new Railway from Twickenham to Kingston, which will be opened early this spring, and within half an hour of the City and Charing cross. The land stands high and dry, possesses a good gravelly soil, is beautifully timbered, and being in the vicinity of Twickenham, Hampton Court, Richmond, and the Thames, is all that can be desired for the erection of first-class residences, which are in great demand. Advances may be made to responsible bunders, or two-thirds of the purchase money if required may remain on mortgage at 5*l*. per cent. A plan of the estate may be seen and particulars obtained of the Proprietor on the Estate and the City is reached in twenty five minutes. The Leases will contain a clause entitling the Lessee to purchase the Freehold within a specified time. LAND also TO LET at Blackheath, Tottenham, Kingston; some very eligible SITES in the Grove road, Mile-end, a few of which are adapted for shops, and large and very CHEAP PLOTS TO LET, at Ealing.—Apply to Mr. KNIGHTLEY, Architect, 25, Cannon-street.

WOODFORD RAILWAY.—THE GROVE, WANSTEAD.—Portions of the beautiful Estate are now TO BE LET for Building purposes, and Villa Residences are much required in the locality. Soil gravel, situation healthy, and water excellent. The Railway Station is 400 yards only from the Estate and the City is reached in twenty five minutes. The Leases will contain a clause entitling the Lessee to purchase the Freehold within a specified time. LAND also TO LET at Blackheath, Tottenham, Kingston; some very eligible SITES in the Grove road, Mile-end, a few of which are adapted for shops, and large and very CHEAP PLOTS TO LET, at Ealing.—Apply to Mr. KNIGHTLEY, Architect, 25, Cannon-street.

ST. HELEN'S, Lancashire.—TO BE LET on LEASE, the extensive MANUFACTURING PREMISES known as the Ravenhead Upper Sheeting Works, situate at St Helen's, with a wharf on the canal, and a branch of the St Helen's Railway running through the property. The entire site is about twenty acres, of which about fifteen acres are occupied by the works, the remainder being arable and pasture land. The buildings comprise a series of very substantially erected, light, and lofty ground flat factories, arranged for the purposes of copper and silver-melting works; but they will be available for many other large manufacturing establishments, as they possess the advantages of direct communication by rail or water carriage with all parts of the Kingdom. Coals can be obtained from pits in the neighbourhood at an almost nominal price, and labour is cheap and abundant.—For particulars apply to Messrs. FULLER & HORSEY, 13, Billiter-street, London, E.C.; and Messrs. HARRISON & FINCH, 2, Gray's Inn, London.

LAND WANTED by the Guardians of the West London Union.—About FOUR ACRES of FREEHOLD LAND, upon which to erect a Workhouse. The Land must be within about four miles of the City of London, and the Middlesex side of the Thames will be preferred.—Full particulars, including prices, to be sent to me, at my Office, as below.
JOHN PONTIFEX, Clerk to the Guardians.
5, St. Andrew-street, Holborn, January 29, 1863.

BUILDING LAND TO BE LET. HACKNEY, close to the Railway Station, for small Dwelling Houses.
NORWOOD, close to the Crystal Palace, for Shops and Villas. PERIVALE HILL, SYDENHAM, for first-class Residences. Advances made if required.—Apply to Mr. T. K. GREEN, 25, College-hill, Cannon-street, E.C.

GUILDHALL, London, 31st of JANUARY, 1863. The COMMITTEE for LETTING the BRIDGE HOUSE ESTATES will meet at GUILDHALL, on FRIDAY, 13th FEBRUARY next, at ONE o'clock precisely, to receive PROPOSALS for REPAIRING LEASE of a HOUSE, No. 13, York place, Kent-street-road, in the county of Surrey. Plans of the property may be seen and forms of Tender obtained on application at the Architect's Office, Guildhall.
FERDINAND BRAND, Comptroller.

TO BRICKMAKERS, BUILDERS, and CONTRACTORS.—BRICK FIELD. TO BE SOLD, with immediate possession, the LEASE and PLANT, &c. of a BRICKFIELD in full work, and pitched on the north side of London. An underlying bed of clay has been proved by subscribers' working.—For particulars apply to JOHN ASHDOWN, Esq. 42, Charing-cross.

WATERSIDE PREMISES WANTED, between London and Vauxhall Bridges, Warehouses or building ground, to rent or purchase.—Address particulars to R. D. 10, Alfred place, Newington causeway.

TO LANDLORDS and OTHERS.—WANTED, FREEHOLD or LEASEHOLD, a PIECE of GROUND to build a Lodging-house, within six miles westward of Charing-cross.—Particulars to be addressed to HENRY KING, 94, Drury lane, W.C.

ON the PORTLAND ESTATE, near Oxford street.—THREE capital HOUSES, with good workshops, TO BE SOLD, together or separate; or the largest House with four workshops, 22ft. by 19ft. 6in. respectively, TO BE LET; together with a Timber Shed.—For further particulars, apply to Messrs. LEREW & LEREW, Auctioneers, Cardington street, Hampstead-road, N.W.

FREEHOLD LAND, about 100 yards from the Station proposed to be constructed at the Queen's-road, Peckham, on the London and Brighton Railway Company's Extension line, is now ready for Building. About 50 Houses have been built on this road thoroughfare, built upon entirely on one side. Gravelly soil, and only three miles from London. The station will be the best all round Land on. Advances will be arranged if required by the person, to the FREEHOLDER, Bath House, Queen's-road, Peckham

BUILDING LAND TO LET, at Canonbury, Haverstock-hill, Lower Norwood, &c.—Also to the Station for large and small Houses, at Croydon; also at Elsworth's road, Bow. Gardens for superior. The usual advances made.—Apply at the Offices of Mr. JAS. MADELEY, Architect and Surveyor, 6, Crown-court, Old Broad-street, E.C.

RICHMOND, Surrey.—Valuable FREEHOLD LAND TO BE LET, or Building.—1st. The substantial mansion known as Suffield House, capable of being divided into two genteel houses; frontage 50 feet, depth 114 feet, and The frontage next Mansion House, 50 feet, depth 114 feet, and The frontage next Eton street, 120 feet, and depth average 53 feet. 4th The frontage next Marsh gate road 16 feet, depth 173 feet. The whole of the above is now let on lease, and may be had at the railway station. To view, apply at the Mansion; and for particulars, to Mr. W. HUDSON, Architect, 19, Bennet's hill, Doctors' Commons.

ALDERMANBURY. — Several HOUSES in the above street, with or without odd tenal groups behind them, may be HIRED from the Freeholders at Christmas 1864, either on building lease or otherwise.—Apply, in the first instance, to Mr. MAY, at Soon College, Lambeth.

BUSINESS PREMISES, covering an area of 1,490 square yards, in the centre of a rapidly-improving town 12 miles from London, within a few hundred yards of a railway station, and adapted for builders, manufacturers, brewers, or others requiring space, with a good Dwelling house, Stabling, Store rooms, and other buildings.—Address to R. KERRIDGE, Surveyor, Kingston, London, S.W.

EXTENSIVE MANUFACTURING PREMISES, Southwark.—TO BE LET on LEASE, extensive MANUFACTURING PREMISES, occupying a very large area, situate in the Borough road, Southwark. The buildings, which are very substantially erected, comprise a very large factory of three lofty floors, with basement, a smaller factory of four floors adjoining, a very spacious and lofty ground floor factory, yard, a capital family residence and other dwelling-houses, counting-house, dwelling houses fronting the Borough road, Nos 77, 78, and 79, which can be readily let off if desired.—For further particulars apply on the Premises, or to Messrs. FULLER & HORSEY, Billiter-street, Fenchurch-street, E.C.

EXTENSIVE MANUFACTURING PREMISES, WHITECHAPEL.—TO BE LET or SOLD, together or separately, the extensive and important RANGE of PREMISES, recently occupied as the Whitechapel Distillery, with land adjoining, if required. The buildings, many of which are of great extent, are most substantially erected, principally in 1845, and very conveniently arranged for almost any industrial purpose. There are three distinct sets of entrances, and the buildings and yards are surrounded with paved yards. The total area is about three acres, exclusive of six acres of accommodation land, which may be had if required. There is an artesian well, which affords a constant and unlimited supply of pure water. Further particulars and cards to view may be had of Messrs. TENNANT & DARLEY, Solicitors, Basinghall-buildings, Gray's inn; and of Messrs. FULLER & HORSEY, Billiter-street, E.C where plans of the property may be seen.

BUILDING LAND.—A PLOT of FREEHOLD LAND, in the centre of Fulham, with a frontage for eight or ten houses, or other buildings, TO BE LET, on lease, or 50*l*. per annum, with immediate possession.—Letters addressed to ALPHA, at Maddala's Library, Edgeware-road, will be attended to

London:—Published by CHARLES WYMAN, Printer, at the Printing-office of Cox & Wyman, Nos. 74 and 75, Great Queen-street, Lincoln's-inn-fields, in the Parish of St. Giles in the Fields; and published by the said CHARLES WYMAN, at the Office of "The Builder," No. 1, York street, in the Parish of St. Paul's, Covent-garden, both in the County of Middlesex.—Saturday, February 7, 1863.

JAMES FERGUSSON, F.R.A.S. } Hon Secs.
JAMES EDMESTON, F.R.I.B.A. }

GALLERIES of the ARCHITECTURAL UNION COMPANY (Limited), 9, Conduit-street, Regent-street, NOW OPEN, FREE, from ELEVEN till FOUR, daily. The Autumn Exhibition of Building Materials, Patents, and Inventions, will CLOSE, FEBRUARY 28, and must then be cleared for the Architectural Exhibition. JAMES EDMESTON, Hon. Sec.

SHEFFIELD SCHOOL of PRACTICAL SCIENCE and METALLURGY.
PRESIDENT
His Grace the Duke of Devonshire, K.G. F.R.S. D.C.L. Chancellor of the University of Cambridge.
VICE-PRESIDENTS
The Mayor of Sheffield, John Brown, esq.
The Master Cutler.
The Right Hon. Lord Wharncliffe.
Sir David Brewster, K.H. D.C.L. F.R.S.L. & E. M.R.I.A.
Sir Roderic Murchison, F.R.S. Director of the Royal School of Mines.
John Percy, esq. M.D. F.R.S. Professor of Metallurgy in the Royal School of Mines.
William Fairbairn, esq. C.E. F.R.S.
Robert Hunt, esq. F.R.S. Keeper of Mining Records.
Warrington W. Smyth, esq. M.A. F.R.S. Professor of Mining and Mineralogy in the Royal School of Mines.
RECTOR.
The Rev. G. R. Atkinson, M.A. Principal of the Collegiate School ; late Fellow and Assistant Tutor of Trinity Hall, Cambridge.
PROFESSORS.
Chemistry, Metallurgy, and Geology—James Allen, Ph.D. F.C.S. of the University of Giessen and Berlin.
Engineering and Mining—J. Thompson C.E.
Mathematics, Natural Philosophy, and Applied Mechanics—Rev. G. B. Atkinson, M.A.
The Sheffield School of Practical Science and Metallurgy will afford complete theoretical and practical education to students who are destined to become civil, mechanical, or mining engineers, or manufacturers of any kind. Its object is thoroughly to discipline the students in the principles of those sciences upon which the operations of the engineer, metallurgist, or manufacturer depend.
The education will be given by means of systematic Courses of Lectures, by Catechetical Class Instruction, by Practical Teaching in the Laboratory and Drawing room, and occasionally by Field Excursions.
The School of Practical Science and Metallurgy will be conducted in the Buildings of the Sheffield Collegiate School. The two Institutions, although both under the superintendence of the Rev. G. R. Atkinson, Principal of the Collegiate school, are, however, entirely distinct.
A detailed Prospectus, containing Syllabuses of all the Courses of Lectures, and all other information, arrangements for boarding, &c. may be obtained by application to the Director.
THE SCHOOL WILL OPEN IN THE FIRST WEEK IN FEBRUARY, 1863.

LECTURES to WORKING MEN, ROYAL SCHOOL of MINES, JERMYN STREET.
The FOURTH COURSE, consisting of SIX LECTURES on MINERALS, by Mr WARINGTON W SMYTH, M.A. F.R.S. will be commenced on MONDAY, the 16th FEBRUARY, at EIGHT p.m.
Tickets may be obtained by Working Men only, from TEN o'clock on MONDAY, the 16th instant, upon payment of a fee of Sixpence for the whole Course. Each applicant is requested to bring his Name, Address, and Occupation, written on a piece of paper, for which the Ticket will be exchanged.
TRENHAM REEKS, Registrar.

BILLING'S PATENTS.
CHIMNEY TERMINALS. THROAT VALVES.
NOTICE to ARCHITECTS.—The Proprietors of the late Mr Billing's Patents have secured the services of Mr H H COLLINS, M.I.B.A. of No 30, Poultry, E.C as the Consulting Architect, from whom full particulars and the reduced prices may be obtained, or from the Manager, Mr. TYLER, 14, Abingdon-street, Westminster, S.W.

ARCHITECTS.—NOTICE is hereby given that the Trustees appointed by Sir John Soane will on or at the MUSEUM, No 14 Lincoln's Inn fields, on TUESDAY, the 24th of MARCH, at TWELVE o'clock at noon precisely, to distribute the Dividends which shall have accrued during the preceding year from the sum of 5,000l Reduced 3l per Cent. Bank Annuities, invested by the late Sir John Soane, among Distressed Architects, and the Widows and Children of deceased Architects left in Destitute or Distressed circumstances. Forms of Application may be had at the Museum, and must be filled up and delivered there on or before SATURDAY, the 14th of MARCH, after which day no application can be received.

COMPETITIONS.

TO ARCHITECTS.—A PREMIUM of 25l. is OFFERED for the BEST PLAN for LAYING OUT EIGHT ACRES of LAND, at Ripon, in building sites, with the elevations of detached and semi-detached villas, of from 30l to 50l rental.—Plans to be sent in by the 24th MARCH. For further particulars, and to view the ground, application must be made to
ROBERT WILLIAMSON, Jun. } Hon. Secs.
JOSEPH STEVENSON, }
Ripon, February 2nd, 1863.

TO ARCHITECTS.—GIRLS' SCHOOLS, MATRON'S HOUSE, and OTHER BUILDINGS.—The Trustees of the General Charities in the city of Coventry, invite Architects to submit DESIGNS, with plans, specifications, and estimates, for the ERECTION (in pursuance of an order of the Court of Chancery) of a GIRLS' INDUSTRIAL SCHOOL, with Matron's House and other necessary buildings in the City of Coventry. The school room should be capable of holding seventy pupils, and there must be accommodation for thirty girls to be boarded and lodged in the house, and the buildings should be arranged so that they could be extended if necessary. The cost of the whole, including all extras, not to exceed 2,000l. A ground plan of the site may be seen at my Office, and a lithographed copy will be forwarded on application. A premium of 20l will be paid for the design, plans, &c which shall be selected and adopted by the Trustees (or which can be carried out for the sum above limited); and a second premium of 10l will be paid for the designs and plans which the Trustees shall think entitled thereto. On payment of the premiums the Trustees are to be entitled to the designs, plans, and specifications selected, but are not to be considered as bound to employ the parties furnishing them ; but in the event of the successful competitor being employed the premiums will merge in his commission. The designs, plans, &c. to be forwarded to me under a letter or motto, with a sealed letter to correspond, on or before SATURDAY, the 21st day of MARCH next, and in the meantime any further information may be obtained on application to me.
HENRY J. DAVIS, Clerk to the Trustees.
Hay-lane, Coventry, February 5, 1863.

CONTRACTS.

DELAMERE, CHESHIRE.—The Commissioner in charge of Her Majesty's Woods and Royal Forests hereby gives notice that TENDERS will be received for the ERECTION of a HOUSE and OFFICES, a HOME-STEAD, BAILIFF'S HOUSE, and TWENTY LABOURERS' COTTAGES, at Delamere, near Hartford, in the County of Chester. Drawings and specifications may be inspected, on application to Mr. MOBIE, at the Abbey Arms Inn, Delamere on and after the ELEVENTH instant, and further particulars obtained on application to Mr John CLUTTON, 9, Whitehall-place, Westminster.
Tenders to be sent in on or before the 9th day of March, addressed to the Hon. and Rev. Thomas B. HOWARD, Office of Woods, Whitehall-place, Westminster, S.W. endorsed, "Tender for works at Delamere."
The Commissioner does not bind himself to accept the lowest or any Tender.

EXTENSION of TIME for receiving TENDERS.—CITY of LONDON, BARBERS' HALL.—Important SALE of WAREHOUSES or MANUFACTURING PREMISES in the immediate vicinity of Wood street and Jewry-street.—The Court of the Worshipful Company of Barbers will meet at their Hall on THURSDAY, the 26th day of MARCH, 1863, to receive TENDERS for LETTING, on a Building Lease for 30 years, the Extensive PREMISES known as Barbers' Hall, situate in Monkwell street, Wood street, comprising three houses fronting Monkwell street, Nos 33, 34 and 35, part of the courtyard in the rear thereof the passage leading thereto, and the greater portion of the Company's Hall, together with the kitchen, scullery, and outbuildings, having a frontage towards Monkwell street of about 81 feet by an average depth of about 11 feet, and an extreme depth of about 135 feet.—Plans and particulars of the property, elevation and section of street front, also conditions of letting, may be obtained on application to the Clerks of the Company ; to Mr CHARLES JOHN SHOPPEE, the Company's surveyor, No. 61, Dalghty street, W.C. ; or to the Beadle at the Hall.—By order,
HENLEY GROSE SMITH, Clerk.
4, Warnford court, Throgmorton street, E.C.

CONTRACTS.

CONTRACT for the SUPPLY of BUILDING MATERIALS for CONVICT PRISONS. Persons desirous of TENDERING for the SUPPLY of TIMBERS, deals, slates, lime, sand, bricks, lead, glass, wrought and cast iron, ironmongery, gas and water pipes, white lead, &c. &c. for twelve months from the 1st of APRIL next to the 31st of MARCH, 1864, for the Pentonville, Millbank, Brixton, Portland, Parkhurst, Chatham, Dartmoor, Woking, and the Asylum, with Woking Broadmoor Prisons, and the Refuge at Fulham, are requested to forward their Tenders, by post, addressed "The Directors of Convict Prisons, 45, Parliament street, Westminster, S.W." on or before SATURDAY, the 21st of FEBRUARY, 1863, at NOON. Forms of Tenders will be supplied on application at the several prisons before named, or at the Office of the Directors, 45, Parliament street, and not later TUESDAY, the 10th of FEBRUARY, 1863.
45, Parliament street, January 31st, 1863.

ERECTION of WORKHOUSE. — To CONTRACTORS, BUILDERS, &c.—PARISH of ST. LEONARD, SHOREDITCH, MIDDLESEX.—The Board of Guardians of the Poor of the above parish, are desirous of receiving TENDERS from contractors for the ERECTION of a NEW WORKHOUSE, for the said parish, to be erected on the site of their present workhouse and adjoining premises, situate in the Kingsland road and Hoxton. Parties tendering will be required to find security for the amount of 20,000l. for the performance of the works in accordance with the drawings and specification. Such drawings and specification can be seen, and all information obtained, at the Office of the Architects, Mr WILLIAM LEE, St. Michael's House, Cornhill. Bills of quantities may be obtained on payment of 10l 10s. which sum will be returned to the parties tendering when Tenders are not accepted. Tenders are to be addressed to the Board of Guardians, and endorsed "Tender for erection, &c. of New Workhouse," and must be delivered at the Board room, Kingsland road, London, N.E. not later than SIX o'clock in the evening of WEDNESDAY, the 25th day of FEBRUARY, 1863. The Guardians do not hold themselves to accept the lowest or any other Tender. Parties tendering must be present, by themselves or their agents, at the time of meeting. By order of the Board,
WILLIAM NIGHTINGALE, Clerk.
Board room, Kingsland road, 4th February 1863.

BOROUGH of WOLVERHAMPTON.—TO CONTRACTORS, MANURE DEALERS, and OTHERS.—TENDERS for REMOVAL of NIGHT SOIL. The Council acting as the Local Board of Health of the Borough of Wolverhampton, are TENDERS from persons who may be willing to undertake the REMOVAL of the NIGHT SOIL, ASHES, REFUSE MATTER, and SURFACE FILTH of the Borough, for a term of one year, commencing at Lady Day, 1863. Printed copies of the proposed contract and specification may be obtained at the Borough surveyor on payment of 2s. 6d. for each copy. Tenders to the Borough surveyor on or before THURSDAY, the 19th of FEBRUARY, 1863, endorsed "Tender for Removal of Night Soil, &c." The Council do not bind themselves to accept the lowest or any Tender.
EDWIN JOHN HAYES,
Town Clerk, and Clerk to the Local Board.
Town Hall, Wolverhampton, February 2nd, 1863.

WEST HAM LOCAL BOARD of HEALTH.—The Local Board of Health for the District of West Ham, in the County of Essex, are prepared to receive TENDERS for SUPPLYING and for LAYING GUERNSEY GRANITE CURB, and also for such Road Metal and Labour as may be required in making and repairing the streets called Frederick's road, Martin street, Station street, Western street, Stratford, within the District, according to plans, sections, specification and conditions prepared by Mr MARSHALL, the surveyor of the Board, and which may be seen at his Office at Robert's house, in Stratford, where also Forms of Tender may be obtained, together with any further information required. Tenders endorsed "Tenders for Kerbs, &c." are to be sent to me, on or before MONDAY, the 23rd FEBRUARY inst.—By order of the Board,
CHARLES WILSON, Clerk.
Robert's House, Stratford.

TO CONTRACTORS and BUILDERS.—The Trustees of Watts's Charity, at Rochester, are desirous of receiving TENDERS for the CONSTRUCTION of a ROADWAY and CESSPOOL, at ground near or adjoining Ordnance Terrace, and a cutting on the road leading to Fort Pitt, in the parish of Chatham, kent. Plans, sections, and specification of the proposed Works (as prepared by Mr. Bidder), are deposited at the Office of Mr WILLIAMSON (the Receiver of the Charity), High street, Rochester, and open to inspection previous and up to the day of Tender, between the hours of Ten and FIVE o'clock. Tenders are to be sent in to the Office of Messrs LEWIS & MARSH, High street, Rochester, on or before SATURDAY, the 21st of FEBRUARY instant (after which day no Tender will be received), sealed up, addressed to the Trustees of Watts's Charity, and marked "Tender." The Trustees will not hold themselves bound to accept the lowest or any other Tender, and the Contractor at his own expense to enter into a sufficient contract, either with or without surety, as the Trustees shall require, for the due execution of the Works.
Rochester, 3rd February, 1863.

BOARD of WORKS for the LIMEHOUSE DISTRICT.—TO PAVIORS and MASONS.—Notice is hereby given that the Works Committee will meet on TUESDAY, the 3rd day of MARCH, 1863, to receive TENDERS from persons willing to contract for the GENERAL WORKS and REPAIRS to the Granite Pavements of the several streets, courts, alleys, and other places under the jurisdiction of the said Board, for two years from the 9th day of APRIL, 1863. Further particulars may be known, and printed conditions, and the scale of Prices and Rates of Border obtained, by parties intending to Tender for the works, upon application at the Office of the Board, White Horse street, Commercial road East, between the hours of TEN and FOUR o'clock, upon payment of twenty shillings, which will be returned to each person sending in a Tender. Tenders, sealed up and endorsed "Tender for Paviors' and Masons' Work," must be delivered at the said Office not later than FOUR o'clock p.m. on the 2nd day of MARCH, 1863. The Board do not bind themselves to accept the lowest Tender. The sum of two pounds per cent. on the amount of the Contract will be required to pay the costs of the contract. No Tender will be received after the time specified, nor unless strictly in accordance with the printed instructions.—By order,
THOS. W. RATCLIFF, Clerk to the Board.
Dean Colet House, White Horse street, Commercial road East, February 10th, 1863.

CONTRACTS.

TO BUILDERS.—Persons desirous of CONTRACTING for the RE-TRATION of the SOUTH PORCH of the PARISH CHURCH at Hythe, Kent, may see the drawings and specification after the 12th instant, by calling on the Town Clerk at Hythe or at the office of Mr CHRISTIAN & SS, White hall place, London. Tenders to be sent to Mr. CHRISTIAN on or before TUESDAY, the 24th instant. The Committee do not bind themselves to accept the lowest Tender.

LUDFORD CHURCH, LINCOLNSHIRE. Builders desirous of submitting TENDERS for the ERECTION of a NEW CHURCH at Ludford near Market Rasen, and Parish, are requested to send in their names before MONDAY, POWER, Esq., Architect, by 10th, on or before the 23rd inst. of FEBRUARY next when they will be informed on what basis they are required to make their tenders, and obtain copies of the specifications. The Committee does not pledge itself to accept the lowest or any Tender not approved.

W. B. HASTINGS, Secretary.

Ludford, February 9th, 1863.

FURNESS RAILWAY.—CONTRACT for WORKS.—The Directors are prepared to receive TENDERS for the Widening and Completion and Laying of a Second Line of PERMANENT WAY between Carnforth and Ulverston stations, for a distance of about thirteen miles, including the widening of the Viaduct over the Kent and Leven Estuaries, in one or in two sections. Drawings of the portion may be seen, and forms of Tender obtained, at and after SATURDAY, the 14th day of FEBRUARY next, on application to Messrs McLEAN & STILEMAN, the Engineers of the Company at 24 Great George street, Westminster; or at the Secretary's Office at Barrow-in-Furness. Tenders addressed to the Secretary, to be sent to No. 9, old Burlington street, London, W on or before MONDAY, the 23rd FEBRUARY next. The Directors do not bind themselves to accept the lowest or any Tender.—By order,

Barrow, January 27th, 1863. JAMES RAMSDEN, Secretary

FURNESS RAILWAY.—The Directors are prepared to receive TENDERS for the SUPPLY of the undermentioned STORES, viz.:—

TONS of RAILS, 70 tons of Chairs, 30 tons of Fish Plates, 1,000 sets of Bolts and Nuts, 5,000 Spikes, and 12,000 Oak or Elm Keys. Drawings and specifications may be seen, and forms of Tender obtained, on and after SATURDAY next, the 14th day of FEBRUARY, on application to Messrs McLEAN & STILEMAN, the Engineers of the Company, at 24 Great George street, Westminster; or at the Secretary's Office at Barrow-in-Furness. Tenders addressed to the Secretary, to be sent to No. 9, old Burlington street, London, W on or before MONDAY, the 23rd FEBRUARY next. The Directors do not bind themselves to accept the lowest or any Tender.—By order,

Barrow, January 27th, 1863. JAMES RAMSDEN, Secretary

COUNTY of SOUTHAMPTON.—To BUILDERS and STONEMASONS.—REBUILDING BOW BRIDGE.—Forms of CONTRACTING for REBUILDING BOW BRIDGE, on the road from Newport to Ventnor, in the Isle of Wight, with plan and specification for same, may be either at the Public Office of the undersigned in Newport, or at the office of Mr F. SOPHER, County Surveyor, St. Swithin-street, Winchester, of whom any further information may be obtained on and after WEDNESDAY, the 11th instant, between the hours of TEN and FOUR. The form of contract will be found to be correct and will be for inspection, with the plan and specification, and forms of Tender may also be obtained there. Sealed Tenders, on the forms supplied, to be sent in on or before SATURDAY, the 7th day of MARCH next. No Tender will be received but that upon the printed forms. The Magistrates do not pledge themselves to accept the lowest or any Tender. The names, residences, and descriptions of two sureties willing to enter into a bond with the contractor for the due performance of the contract, must accompany the Tender.

T. B. WOODHAM, Deputy Clerk of the Peace.

County Hall, Winchester, February 4th, 1863.

COUNTY of SOUTHAMPTON.—ISLE of WIGHT ARTILLERY MILITIA STORES.—To BUILDERS and STONEMASONS.—Forms of CONTRACTING for MAKING ALTERATIONS and CONVERTING certain BUILDINGS, formerly used as barracks and others, within Parkhurst Cadet, in the Isle of Wight, into STORES for the Isle of Wight Militia, may be had either for the Sureties in charge, near at hand, or personal application for such Works, either at the present Militia Stores, Carisbrooke Priory hill, No. 2, or at the office of Mr. J. SOPHER, County Surveyor, St. Swithin-street, Winchester, of whom any further information may be obtained on and after WEDNESDAY, the 11th instant, between the hours of TEN and FOUR. The form of contract will be found to be correct and will be for inspection, with the plan and specification, and forms of Tender may also be obtained there. Sealed Tenders, on the forms supplied, to be sent in on or before SATURDAY, the 7th day of MARCH next. No Tender will be received but that upon the printed forms. The Magistrates do not pledge themselves to accept the lowest or any Tender. The names, residences, and descriptions of two sureties willing to enter into a bond with the contractor for the due performance of the contract, must accompany the Tender.

T. B. WOODHAM, Deputy Clerk of the Peace.

County Hall, Winchester, February 4, 1863.

TO QUARRYMEN, STONE MERCHANTS, and OTHERS.—The Dover Local Board invites TENDERS for the SUPPLY of 1,000 cube YARDS GRANITE and 1,000 cube YARDS of CHANNELLING and 750 square YARDS of YORKSHIRE PAVING. The flints to be broken to a size to pass through a 2-inch mesh, and the granite to the size required by the Surveyor of the Board may direct, from the date of acceptance of the Tender. The granite to be from Guernsey. Tenders to be delivered to the undersigned Between 2 and 3 p.m. and flints to be delivered on or before the 18th day of MARCH next, and the granite in such quantities as may be agreed upon with the Surveyor, but on or before the 30th day of June next. The Kerbs to be All-down, or Guernsey Granite, 12 inches in face by 7 inches deep, dressed the same. The Channelling to be of the same quality, 9 inches in face by 6 inches deep, dressed on face and on one side, and to square and true ends. The Kerbs to be delivered before the 18th day of MARCH next. The Yorkshire Paving Stone to be of approved quality, and to be delivered at the Station before the 31st day of MAY next. The Flints are to be delivered by the contractor at such part or parts of the harbour as the Surveyor may direct; and all the materials contracted for are to be subject to be passed by the said Board, or the Quay at Dover, and all the deliveries are to be subject to the approval of the Surveyor, who is to have the power to reject any part or the whole of the shipment in accordance with the terms of the contract. The price to be stated, also to include freight, labour, and all other charges whatever, except wharfage on local dues, which will be paid by the said Board. Payment will be made within two months after the date of the certificate of the Surveyor that any delivery is in accordance with the terms of the contract. The Board do not bind themselves to take any one or more of the articles above named in the lots, but shall be at liberty to take any one or more of the materials named in any Tender with the necessary quantity of each required in such Tender. Any person whose Tender is accepted will be required to execute a deed of contract with sufficient sureties, to be approved by the Town Clerk at the expense of the said Board, and further particulars may be obtained by inquiry at the Surveyor's Office. Tenders, in sealed covers, marked "Tender for Flints," or "Granite," as may be, are to be delivered at this office, on or before WEDNESDAY, the 18th day of FEBRUARY instant. The local Board do not bind themselves to accept the lowest or any Tender.—By order

KNOCKER, Town Clerk.

Local Board Office, Dover, February 6, 1863

TO BUILDERS and CONTRACTORS.—PERSONS desirous of CONTRACTING for the ERECTION of a FLOOR-CLOTH MANUFACTORY, at Milbank, Stirling, may see the plans and specification at the Office of Mr THOMAS DANBY, Albert Road, Pendleton, Manchester, on application. Messrs HARVEY & KNIGHT, Engineers, Bolton-by-Bowland, on and after FEBRUARY, 17th, and the Tender between the hours of TEN and FOUR, where sealed Tenders, addressed to Mr. DANBY, Surveyor, are to be sent. The Tenders are to be sent on or before the 24th FEBRUARY, 1863. Any further information may be obtained on written application to the Surveyor. HARVEY & KNIGHT do not bind themselves to accept the lowest or any Tender.

METROPOLITAN BOARD of WORKS.—To BUILDERS, CONTRACTORS, and OTHERS.—The Metropolitan Board of Works hereby give notice that they will meet at the Office of the Public Supply Engineer, S.W. on FRIDAY, the 27th day of FEBRUARY instant, at TWELVE o'clock at noon precisely, and will then be prepared to open TENDERS by parties who may be willing to CONTRACT for the CONSTRUCTION of a BRICK SEWER 1,950 feet in length or thereabouts, with other works in connection therewith, at the back Hill in the parish of St. Giles, Camberwell, in the county of Surrey. Plans, sections, and a specification, together with the form of Tender, may be inspected, and other particulars obtained, on application to Mr J. W. BAZALGETTE, Engineer of the Board, at the Office of the Public Supply Engineer, as before, on MONDAY and TUESDAY next, between the hours of NINE a.m. and FOUR p.m. or on SATURDAYS between the hours of NINE a.m. and TWO p.m. until THURSDAY, the 26th day of FEBRUARY. The Tenders are to be addressed to the Chief Clerk of the Board, and must be delivered at the Office before FOUR o'clock on the last-mentioned day, and no Tender will be received after that hour. The parties Contracting must enter into sureties to the Board in TWENTY pounds each for the due and satisfactory performance of the works.

JOHN POLLARD, Clerk of the Board.

Spring gardens, S.W. February 6th, 1863.

TO BUILDERS. — Builders desirous of TENDERING for the ERECTION of the NEW SCHOOLS and TEACHER'S RESIDENCE, at Ruscombe, Hurst, may view the Plans and Specifications after MONDAY, the 16th inst. at the Office of Mr. NICHOLAS JOYCE, 18, High street, Burton-on-Trent. Sealed Tenders to be delivered before MONDAY, MARCH 2nd, addressed to the Rev. W. H. HARKE, the Parsonage, Newbold, Burton on Trent. The Committee do not bind themselves to accept the lowest or any Tender.

TO ROAD MAKERS. —The Guardians of the Poor of the Stepney Union will meet at Ratcliff Workhouse, York street West, Commercial road East, on THURSDAY, the 19th day of FEBRUARY instant, at FIVE o'clock in the afternoon, to receive and open TENDERS for persons willing to MAKE UP and FORM the ROADS, &c. of the NEW WORKHOUSE PREMISES of the UNION at Bromley, Middlesex.—Copies of the specification, under the Seal of the Board, and particulars, may be obtained from the Architect, Mr. HENRY JARVIS, at his Offices, No. 29, Tothill-street, Westminster, where also may be seen the plans and sections of the intended works.—By order of the Guardians,

February 5, 1863. W. H. SWEPSTONE, Clerk

BOARD of WORKS, WHITECHAPEL DISTRICT.—A meeting of this Board will be held on MONDAY, the 23rd day of FEBRUARY, 1863, at SIX o'clock in the evening, at the Office of the Board, No. 15, Great Alie-street, Whitechapel, to receive TENDERS for CLEANSING the STREETS and GUTTERS and for REMOVING the DUST and other REFUSE within the district, for the period of one year, to commence from the 1st day of APRIL next, and for WATERING the ROADS and STREETS from and after the 1st day of MAY next. Persons disposed to contract may obtain printed forms of the several Tenders, and level information thereto may require, at the Office of the Board. Sealed Tenders, in which a bid or bids is to be encased, must be delivered at the Office of the Board, before FOUR o'clock in the afternoon of the day of meeting; any Tender which is not upon the printed forms prepared by the Board, and duly signed by the person or persons tendering, as well as by the present proposed sureties will be rejected. Persons tendering are required to attend the Board at HALF PAST SIX o'clock, in order that a preliminary agreement may be signed by the person whose Tender is accepted.—The Board, however, do not bind themselves to accept the lowest or any Tender.

ALFRED TURNER, Clerk to the Board.

15, Great Alie-street, Whitechapel, February 3, 1863.

CHAPLIN'S PATENT PORTABLE STEAM ENGINES AND BOILERS.

PRIZE MEDAL, INTERNATIONAL EXHIBITION, 1862.

Stationary Engine. From 1 to 30 Horse Power.

Portable Steam Crane. 1 to 10 Tons.

Contractors' Locomotive. 6 to 27 Horse Power.

From the strength, simplicity, and compactness of these Engines, they are now extensively used for general purposes; also in situations where Steam Engines of the ordinary construction cannot be applied.

Stationary Engines,—require no building in, nor chimney stalk, and with our Patent forced combustion apparatus, will burn inferior qualities of coal, wood, or peats. These Engines are specially suited for shipment, and may be packed inside the Boiler to economise freight.

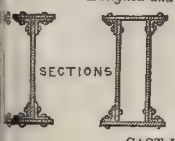
Portable Steam Cranes,—for wharf or railway, with wrought-iron carriages on wheels, link motion, foot brake, &c., all under the easy control of one man; the larger sizes hoist, lower, and turn round in either direction by steam.—*These Cranes were selected by H.M. Commissioners for receiving and sending away the heavy machinery at the International Exhibition of* 1862.

Contractors' Locomotives,—are adapted to work on rails or tramways of a gauge from two feet upwards; they are complete and efficient Locomotives, simple in construction, and the working parts easily got at for repair; they draw heavy loads at reduced speeds. These Engines are usually sent in one package, ready for work on arrival.

LIGHT PORTABLE, HOISTING, WINDING, AND PUMPING ENGINES, &c.

ALEXANDER CHAPLIN & CO.,

CRANSTONHILL ENGINE WORKS, GLASGOW, or LONDON DEPOT and WHARF, Lower Fore Street, Lambeth, S.



Engines of each class KEPT IN STOCK for SALE or HIRE, and all our Manufactures GUARANTEED as to EFFICIENCY, MATERIAL, and WORKMANSHIP.

Parties are cautioned against using or purchasing Imitations or Infringements of these Patent Manufactures.

MATTHEW T. SHAW, 64, CANNON STREET, LONDON BRIDGE, E.C.

Orders requiring Despatch and Punctuality can be executed in a few days.

CUNDY'S

PATENT BRICK OVEN WINDING CHECK SEMI-CLOSE KITCHEN RANGE.

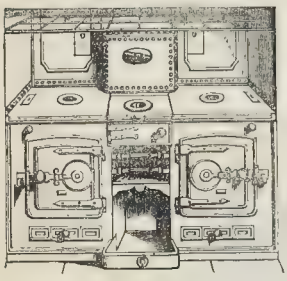
This Range will be found very superior to the close Range now in use, inasmuch as it combines the cleanliness of a close kitchener with the perfect ventilation of an open range.

The fall-down bar will be found useful for broiling purposes when the fire is low.

The Ventilator in the Oven Chimney, and also the Register, can be kept open without diminishing the efficiency of the range, thereby entirely removing the great objection and discomfort of all other close ranges, namely, the sulphurous and excessive heat in the kitchen, and the smell of cooking all over the house.

The great advantage of a brick oven is, that it absorbs the steam given out by bread or meat in the process of baking; consequently the latter is totally free from the disagreeable flavour too evident in meat baked in an iron oven.

As the fire of this range can be diminished or enlarged at pleasure, it can (when not in use for roasting) be wound up within 6 inches of the oven, and still be used for baking, also for boiling upon the hob over the oven, thereby effecting a considerable saving of coals.



THIS RANGE,—ALSO CUNDY'S PATENT BRICK OVEN DOUBLE FALL-DOWN BAR KITCHEN RANGE, and CUNDY'S PATENT COTTAGER'S KITCHENER,—can be seen in operation at the Show Rooms of THE MANUFACTURER,

WILLIAM ADDIS,

WHOLESALE AND RETAIL IRONMONGER, AND STOVE, GRATE, AND RANGE MANUFACTURER,

6, 7, and 15, LEICESTER STREET, LEICESTER SQUARE,

Where Mr. CUNDY can be gratuitously consulted, personally, or by letter, relative to the cure of Smoky Chimneys.

FENDERS, STOVES, FIRE-IRONS, AND CHIMNEY-PIECES.

Buyers of the above are requested, before finally deciding, to visit

WILLIAM S. BURTON'S SHOW-ROOMS.

They contain such an assortment of FENDERS, STOVES, RANGES, CHIMNEY-PIECES, FIRE-IRONS, and General IRONMONGERY, as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with ormolu ornaments, 3*l.* 15*s.* to 33*l.* 10*s.*; Bronzed Fenders, with standards, 7*s.* to 5*l.* 12*s.*; steel Fenders, 2*l.* 3*s.* to 11*l.*; ditto, with rich ormolu ornaments, from 3*l.* 3*s.* to 18*l.*; Chimney-pieces from 1*l.* 8*s.* to 100*l.*; Fire-irons, from 2*s.* 3*d.* the set to 4*l.* 4*s.* The Burton and all other Patent Stoves, with radiating hearth-plates.

WALTER MACFARLANE & CO.

ARCHITECTURAL IRONFOUNDERS, SANITARY ENGINEERS, AND ART WORKERS,

GLASGOW, 1st January, 1863.

WE take the liberty of intimating our REMOVAL to New and much more Extensive Premises, 46, WASHINGTON STREET, where we shall endeavour to merit a continuance of that patronage with which we have been so long favoured.

We carry with us to our New Premises our old and well-known designation of "SARACEN FOUNDRY," and every Casting made by us bears our Trade Mark legibly impressed thereon, as follows:—

WALTER MACFARLANE & CO.

Trade Mark.

LONDON, 1st January, 1863.

WE have the pleasure of intimating that our New London Premises are open for the transaction of business, and now embrace the Architectural as well as the Sanitary branch of our Manufactures.

We shall therefore feel obliged by our friends forwarding all future orders, &c. to this our only London address, when the same shall receive our prompt attention.

WALTER MACFARLANE & CO.

SARACEN FOUNDRY, 46, Washington Street, GLASGOW; and 38, Bedford Street, STRAND, LONDON, W.C.

The PRIZE MEDAL for SUPERIOR PATENT SASH and BLIND LINES, was awarded to JAMES AUSTIN, at the INTERNATIONAL EXHIBITION, 1862.

AUSTIN'S IMPERIAL PATENT SASH and BLIND LINES.

To BUILDERS, CARPENTERS, and BLIND MAKERS.

J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his

IMPERIAL PATENT FLAX SASH-LINES

of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.

ESTABLISHED 1774.

PATENTED HOT AIR APPARATUS in CAST IRON, consisting of prismatic tubes, to be applied to chimneys with flues and heat-conduits. OCTAVIUS N. SIMPSON, STAMFORD;
and see Specimens at the Office of
Messrs. PINDER SIMPSON & SONS, 29, Savile-row, London, and at the Museum of Practical Geology, Jermyn-street, W.

This stone (which is a perfect oolite, is raised in blocks of any portable size, and is about four feet thick. It will stand ANY WEATHER, is much used for water works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the kingdom.

TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION.
MAGNUS'S ENAMELLED SLATE
obtained the Medal of the Society of Arts, the Prize Medal at the Great Exhibition, 1851, Two First-class Medals at Paris Exhibition, and Two Prize Medals at the International Exhibition, 1862.
Trashy imitations of this beautiful material are being palmed upon the public. Aromite is are therefore requested to see that the name of "MAGNUS" is upon each article.
Chimney pieces, Jambs, Hall tables, Table tops, Baths, Wall linings &c. a New Illustrated Catalogue of which can be had at the Pimlico Slate Works, 48 and 49, Upper Belgrave-place, Pimlico, S.W.

SLATES.—MESSRS. JONES & CO. have a STOCK of SLATES of different sorts from the best quarries in Wales, also Slate of different thicknesses, always on hand, at prices of not less than five tons.—Price forwarded and estimates given on application to Messrs.
No. 1, BOLD-TERRACE, CHESTER.

F. RANSOME'S
NEW PATENT CONCRETE STONE,
Made without mould.
For which the Commissioners of the Exhibition of 1862 HAVE AWARDED THE PRIZE MEDAL, as well for SHARPNESS OF OUTLINE, BEAUTY OF APPEARANCE, DURABILITY, AND CHEAPNESS stones manufactured by BROWN'S Concrete Patents, as suitable for the construction of DRY WALLS, DOCKS, &c. as well as BUILDINGS generally. It surpasses every other material in its application to every description of ARCHITECTURAL EMBELLISHMENTS, CAPITALS FOR COLUMNS AND PILASTERS, CHIMNEYPIECES, TRUSSES, BALUSTRADES FOR TERRACES, GATE PIERS, CAPS, AND TERMINALS, Monuments, Tombs, and other ornamental Masonry Requirements, &c. &c.
For Prices, specimens, &c. testimonials, and reference apply to Mr FREDK RANSOME, 33, Parliament street, Westminster, or Patent Stone Works, Ipswich.

W. & J. FREEMAN, Merchants in the various descriptions of STONE, GRANITE, and SLATE, for Engineering and Building Purposes, supplied direct from the Quarries, by vessel or railway. Direct communication with the principal parts for EXPORTATION. Wharf prices and estimates for special contracts, forwarded on application. Offices, 37, Millbank street, London, S.W.

O. M'CARTHY, CARMAN, and SAND and CEMENT MERCHANT, Whitefriars Wharf, Whitefriars, Fleet-street, City, and from Nine Elms Wharf, Battersea, supplied in the yard or per barge. Burnt, screened or unscreened, by the yard or per barge. Stocks Lime and Old Bricks. Dry rubbish delivered, per barge, in any quantity alongside the Thames.

COLOURING DRAWINGS, in the first style, by one who has just completed perspectives for the Academy Gold and Lady Exhibitors. Also, having Tinted Architectural Drawings, and designed the Sanitary Wall Paper, the Advertiser will undertake the colouring of Drawings at his own residence, at moderate charge.—Address, L. C. 12, Northampton-square, E.C.

HAY'S PATENT WATERPROOF GLUE
and INDIA RUBBER VARNISH.—To ARCHITECTS, BUILDERS, PAPER HANGERS, &c.—The WATER PROOF GLUE is a special anti damp, and is suitable for contractors, joiners, cabinet makers, &c. for fixing paper hangings, wall papering, canvas papering, coating zinc verandahs, &c. &c. Copy of a letter from Messrs. Rogers & Booth, contractors, Gosport:—
"We have repeatedly used Mr. Hay's preparation of glue as a preventive against damp, and have found it most valuable as paste and as a size to receive paper. In one instance, where the wall was thoroughly saturated with moisture from a newly raised mound against the outside, we used your varnish internally, and papered the surface, within a few hours of its being applied, with complete success. We have also used your preparation for coating large quantities of canvas laid, at the Admiralty, Potters, for the Majesty's Dockyards."
To be had from all Ironmongers, Oil and Colourmen, &c.
Manufactory, Chandos-street, Portsmouth; Mr. GEORGE WEEKS, Manager. GEORGE C. WARDEN & CO. General Agents, 19, London-street, London, E.C. where specimens, &c. on application can be seen.

VENETIAN BLINDS
should have LEWTAS'S NEW PATENT ACTION which ENTIRELY SUPERSEDES the HOOKS and main cause of winding the cords. Can be easily fixed to old blinds. Price, 7 cord actions 2s.; 8 cord do. 3s. A liberal commission to the trade. To be had of—
EDGAR PARKS, Ironmonger and Sole Agent,
101, Fleet street, London.

PATENT ASPHALTIC ROOFING FELT.
D. ANDERSON & SON,
BELFAST
And 23 and 24, BILLITER STREET, LONDON,
Patentees and Manufacturers of asphalte roofing, ship sheathing, floor and footpath felts. Contractors, Builders from a distance, and others, supplied on lowest terms.

VIEILLE MONTAGNE ZINC.

THE ITALIAN-FORMED ZINC is much approved of by Architects and Engineers on account of its strength, durability, and appearance. On account of the light framing required, roofs, including framework and fixing, can be covered with it FOR £3 PER SQUARE up to 25 feet span. Sheds of larger span, including posts, 4*l.* per square. Architects are cautioned against allowing anything thinner than No. 13 gauge (20 oz.) to be used. ALL PLATES SHOULD BE REJECTED NOT BEARING, in addition to the Company's name, the words "ROOFING ZINC," and the gauge. OLD ZINC RETAKEN AT HALF THE MARKET PRICE OF NEW.

For Designs and Estimates for Roofs, with Timber or Iron Framework, IRON CHURCHES COVERED WITH ZINC, and Buildings for the Colonies, apply to

THE COMPANY'S SURVEYOR,
12, MANCHESTER BUILDINGS, WESTMINSTER, S.W.

BATH STONE OF BEST QUALITY.

RANDELL & SAUNDERS, Quarrymen and Stone Merchants, Bath.

List of Prices at the Quarries and Depôts, also Cost for Transit to any part of the United Kingdom, furnished on application to BATH STONE OFFICE, CORSHAM, WILTS.

BATH STONE OF THE BEST QUALITY.

PICTOR & SON, Quarry Proprietors and Stone Merchants, Bath.

Lists of Prices at the Quarries and Depôts, also Cost of Transit to all parts of the Kingdom, forwarded on application to BATH FREESTONE WORKS, BOX, NEAR CHIPPENHAM, WILTS.

BIELEFELD & THOMAS,

PAPIER MACHE WORKS, 21, WELLINGTON-STREET, STRAND, LONDON,

ESTABLISHED 1826,

Request the attention of Architects, Builders, Decorators, &c. to their VARIED and EXTENSIVE STOCK of ENRICHMENTS, CENTRE FLOWERS, VENTILATORS, MOULDINGS, CORNICES, PILASTERS AND PANEL DECORATIONS, &c. &c.

DESIGNS AND ESTIMATES GIVEN FOR THE ENRICHMENTS IN PUBLIC OR PRIVATE BUILDINGS. ENGRAVED DESIGNS FOR VENTILATORS, CEILING, FLOWERS, &c. SENT FREE ON APPLICATION. PRINTED PATTERN BOOKS, WITH PRICES, CAN BE OBTAINED AT THE WORKS.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Baryte from ten to thirty per cent. With ra Double, heavy Paint Brushers 2 lb. Paint will cover as much as Two or three 1 lb. ones, do work much more good work with such inferior Materials, and have invented the Patent Zinc Paint will never willingly use any other Paint for their best work.

DARKNESS.—Not only is it lighter per Imperial Weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

TO ENGINEERS, MILLWRIGHTS, &c.

Lately published, in 18mo neatly cloth, Fifth Edition, greatly enlarged, improved, to which is added a new Table of Fractional Numbers, 12mo. 2s. cloth,

THE MILLWRIGHT and ENGINEER'S POCKET COMPANION: containing Decimal Arithmetic, Tables of Square and Cube Roots, Reciprocals, Circumference and Mensuration, Pumps, Pumping, and Steam-Engines; with Tables of Circumferences, Squares, Cubes, &c.

By WILLIAM TEMPLETON. Revised by S. MAYNARD.

"A more useful addition to the engineer's library cannot well be conceived."—*Mechanics' Magazine*.

"The present edition having undergone the careful revision of so competent an editor as Mr. Maynard, is worthy of great recommendation."—*Athenæum*.

"Will be found of great use to those for whom it is designed."—*Builder*.

Also, by the same Author,

TEMPLETON'S ENGINEER'S COMPANION BOOK: consisting of Practical Rules and Tables adapted to Factory and Steam Engines, &c. Fifth Edition, with several new Illustrations. 12mo. 5s. cloth.

TEMPLETON'S LOCOMOTIVE ENGINE POPULARLY EXPLAINED. Illustrated by new Designs. Second Edition. 12mo. 1s. cloth.

London: SIMPKIN, MARSHALL, & CO. Stationers' Hall-court.

GEOMETRICAL DRAWING FOR MILITARY STUDENTS

Part I. New Edition, in post 8vo. with 8 plates, price 6s.

ELEMENTARY GEOMETRICAL DRAWING, including Practical Plane Geometry, the Construction of Scales, the Use of the Sector, the Marquois Scales, and the Protractor.

By S. H. WINTER, F.R.A.S.

WINTER'S ELEMENTARY GEOMETRICAL DRAWING. Part II. The Elements of Descriptive Geometry, with its Application to Horizontal and Vertical Projections, and the Projection of Solids at 18 Inclinations. 8s. cloth.

London: LONGMAN, GREEN, & CO. 14, Ludgate-hill.

On Saturday, February 28, will be published, Part I. in 8vo. price 5s. sewed,

A DICTIONARY of CHEMISTRY, to include that of the late Dr. Ure.

By HENRY WATTS, B.A. F.C.S.

To be continued Monthly, and completed in 3 Parts, forming 3 Volumes, uniform with the New Edition of Dr. Ure's "Dictionary of Arts, Manufactures, and Mines," recently completed.

London. LONGMAN, GREEN, & CO. 14, Ludgate-hill.

In 12mo with Diagrams and Figures, price 2s. 6d.

LAND SURVEYING and LEVELLING, arranged and simplified for the use of Private Students and Engineering schools, also for Gentlemen going out to India or into the Colonial Service.

By ROBERT THORNTON, Civil and Practical Engineer.

London. LONGMAN, GREEN, & CO. 14, Ludgate-hill.

NEW EDITION OF WOOD'S ALGEBRA, BY LUND.

The Sixteenth Edition, in 8vo. price 12s. 6d. cloth,

WOOD'S ELEMENTS of ALGEBRA, for the Use of Students in the University of Cambridge. A new Edition, revised and improved by the Rev. THOMAS LUND, B.D. late Fellow and Sadlerian Lecturer of St. John's College, Cambridge.

LUND'S COMPANION to WOOD'S ALGEBRA, 7s. 6d.

LUND'S KEY to WOOD'S ALGEBRA, 7s. 6d.

London: LONGMAN, GREEN, & CO. 14, Ludgate-hill

In post 8vo. with Sixty-nine Figures, price 5s. cloth.

COMPENDIUM of MATHEMATICAL GEOGRAPHY, for the use of Students and Candidates for Public Examinations.

By A. H. DICK, M.A. Lecturer on Geography, Free Church Normal Training Institution, Glasgow.

With a Preface by J. S. LAURIE.

London: LONGMAN, GREEN, & CO. 14, Ludgate-hill.

Forty-third Edition, price 1s. in limp cloth,

LAXTON'S PRICE BOOK for 1863, for ARCHITECTS, ENGINEERS, BUILDERS, CONTRACTORS, SURVEYORS, &c. (established 1818), containing with a variety of new and useful matter more than Seven Hundred Prices, carefully adjusted to all the various trades connected with the operations of the Architect, Engineer, Builder, Contractor, and Surveyor; together with 3,000 useful and important Memoranda relating to these and other matters. Also, full Descriptions of the Qualities of Bricks from the Quarries of England, Scotland, and Wales; Instructions for Estimating and Contracting for Excavations and Stonework of Cost and Weight Iron Girders, Columns, &c. &c. The whole carefully revised and corrected to date of publication.

SIMPKIN, MARSHALL, & CO. STATIONERS' HALL COURT, E.C. and all Booksellers in Town and Country.

HERALDRY, HISTORICAL and POPULAR.

By C. BOUTELL, M.A.

750 Illustrations. Price 7s. 6d.

London: WINSOR & NEWTON; and all Booksellers, Artists' Colourmen, &c.

BUILDER'S PRICE LIST BOOK, 1863. Price 2s. 6d.

WILLIAM DAWBARN & CO. Liverpool, have now ready their Builder's Price List Book for 1863, containing the prices of all Building Materials, Timber, Slates, Iron-ware, Pipes, Stoneware, &c. &c. carefully revised and corrected to the present date. The book contains sundry designs and useful calculations for builders generally.

The Price is 2s. 6d to those who have no account open with W. D. & Co.; but persons desirous of opening an account, on giving satisfactory references, can have a copy posted free.

Prices current of Timber and Deals are issued monthly, and may be had on application.

INVESTORS should consult PIKE'S BRITAIN'S METAL MINES and PRICE CURRENT, which contains latest Statistics of the best speculations of the day, original outlay on each security, the dividends, and the most eligible mines for immediate investment.—May be had for 13 stamps on application to JOHN R. PIKE, 3, Finsbury Court, Old Broad-street, London, E.C.

THE ADVANCE OF SCIENCE.

Now ready, with fine Portrait of Sir CHARLES LYELL, F.R.S. and Vignette of the Underground Railway, fcap. 8s. cloth,

THE YEAR-BOOK of FACTS in SCIENCE and ART. Exhibiting the most important Improvements and Discoveries of the Past Year in Mechanics, the Useful Arts, and the Physical Sciences.

By JOHN TIMBS, F.S.A. Author of "Things not Generally Known," &c. &c.

*** This work, published annually, records the proceedings of the principal Scientific Societies, and is indispensable for those who wish to possess a faithful picture of the progress of Science and the Arts.

"Ably and honestly compiled."—*Athenæum*.

Also an Extra Volume, price 6s. entitled

THE YEAR-BOOK of FACTS in the INTERNATIONAL EXHIBITION of 1862. With a fine Photograph by the London Stereoscopic Company.

"Here is just as much preserved about the Exhibition as, when it has been swept away, any one would care to know."—*Morning Advertiser*.

"A very timely, useful, and interesting compendium and memento of the Exhibition of 1862."—*Builder*.

"A rapid, concise, and careful examination of the contents of the great palace, pleasant for perusal and convenient for reference."—*Saturday Review*.

"An excellent *Aide Mémoire* of the Exhibition."—*Mining Journal*.

N.B.—The Volume for 1851 with Portrait of Lord Brougham, and that for 1852, with Portrait of Wilhelm Faraday, F.R.S. are still on sale. A set of the four volumes, viz. 1851, 1852, and 1863, price 5s. each, and the extra volume, price 6s. will be forwarded free on receipt of a Post office Order for 31. 1s.

London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Now ready, printed on good paper,

THE USEFUL WEATHER GUIDE for FARMERS, GARDENERS, SAILORS, &c.

One dozen copies sent free by post on receipt of one penny stamp. Address to

T. ROBERTS & CO. 8, Crane-court, Fleet-street, London.

METROPOLITAN IMPROVEMENTS.—Will be ready in a few days, STANFORD'S MAP of METROPOLITAN RAILWAYS, BRIDGES, EMBANKMENTS, &c. including the PROPOSED RAILWAY AND OTHER PLANS BROUGHT BEFORE PARLIAMENT FOR SESSION 1863; also, the Railways Sanctioned and in Operation. Size, 34 in. by 26 in. on a scale of two inches to a mile. Price, in sheet, 2s.; mounted in case, 4s.; or on roller, varnished, 6s.

London: EDWARD STANFORD, 6, Charing-cross, S.W.

SURVEYING, LEVELLING, and CIVIL ENGINEERING.—PRACTICAL FIELD INSTRUCTION given in Surveying, Levelling, Civil Engineering, &c.

For particulars apply at the Establishment of Messrs. HYDE, SMITH, & LEWIS, Civil Engineers, Surveyors, &c. for giving Instruction in every branch of the Profession. Terms for the Course of Three Months, Two Guineas. No Extras.—24, Guilford-st. Russell-square.

ARCHITECTURAL and ENGINEERING DRAWING CLASSES, for Architects, Builders, and Engineers' Sons, Assistants, Clerks of Works, &c. &c. Established by Messrs. HYDE, SMITH, & LEWIS, Architects, Civil Engineers, &c. for giving DAY and EVENING INSTRUCTION in Architectural, Engineering, and Mechanical Drawing; Perspective, Isometrical and Geometrical Drawing; Making Finished and Working Drawings; Preparing Specifications; Taking out Quantities, Estimating Builders' Work, &c. Terms:—Day Pupils, Three Guineas per Quarter; Evening Pupils, One Guinea per Quarter, Five Evenings per Week, from 7 to 10. There are no Extras. The Terms include the whole of those above, with the use of Drawings, Boards, Squares, &c.—For Prospectuses of the new RC cases, apply at the Establishment, 24, Guilford-st Russell-sq.

TO INVENTORS.—All intending Patentees should procure the PRINTED INFORMATION regarding Patents—their cost, and the mode of procedure to be adopted issued gratis by the General Patent Company (limited), 71, Fleet-street, London. ROBERT M. LATHAM, Secretary.

THE VILLAGE CLOCK.—A serviceable, well-made, and warranted TURRET CLOCK, to go eight days and strike the hours, for Forty Guineas; not to strike, from Fifteen to Twenty Guineas; adapted for the village church or school.

INTERNATIONAL EXHIBITION.

Also a smaller Turret Clock, from Fifteen to Twenty Guineas, suitable for school or stable, in Class 15, No. 3,248.

JOSEPH FAIRER,
Turret Clockmaker to Her Majesty's War Department,
188, St. George-street East, London.

DENT, CHRONOMETER, WATCH, and CLOCK MAKER to the Queen and the late Prince Consort, and MAKER OF THE GREAT CLOCK FOR THE HOUSES OF PARLIAMENT, Invites attention to the superior workmanship and elegance of design of his extensive Stock of Watches and Drawing-room Clocks.

Ladies' Gold Foreign Watches	8 Guineas.
Gentlemen's do. do.	10 "
Ladies' or Gentlemen's Gold English Lever Watches	18 "
Strong Silver Lever Watches	9 "
Gentlemen's Gold Compensation Balance Watches	40 "
Do. Silver do. do.	25 "
Marine Chronometers	35 "

Gold and Silver Pocket Chronometers, Astronomical, Turret, and Bracket Clocks, of every description. An elegant assortment of Second-hand Fine Gold Watches.

DENT, 61, Strand (adjoining Coutts's Bank); 34 and 35, Royal Exchange; and at the Clock and Marine Compass Factory, Somerset Wharf, Strand, London.

BRYCESON'S ORGAN FACTORY, BROOK STREET, EUSTON ROAD, LONDON, N.W. Established 1796.—Apply for PRICED CATALOGUE of St. Cecilia, Scudamore, and other Organs usually in Stock. Also as to the Tuning, &c. of Organs in all parts of the country. Church Organs of any size built, enlarged, or removed, as well as removed and WAREHOUSED DURING RESTORATIONS. PRIZE MEDAL, 1851.

WANTED to PURCHASE, SECOND-HAND LEVEL, with legs complete, in good condition; also a PLEASCOPE STAFF, not less than 14 feet long.—Apply, stating maker's name and price, to J. C. B., Box 131, Wolverhampton.

The Builder.

VOL. XXI.—No. 1045.

Akroydon. Improved Dwellings for the Working Classes.

AMONG the many recent movements having for their object the welfare of the working classes, we believe none to be more important or more essentially practical in its aims than that which begins by providing wholesome dwelling-places for working-men. And this is the case both because the development and encouragement of home influence and home ties are to the last essential, and because without our having yet fully recognized it, yet undoubtedly, healthy well-drained houses, well-ventilated living and sleeping apartments, with enough of both, lie at the very foundation of the possibility of health, happiness, and morality, and therefore of success.

Up to within comparatively recent times the efforts of philanthropists have been directed more towards the amelioration of great social evils than towards the prevention of them; in curing the sick man rather than to keeping him in health; in rendering him assistance when he is irretrievably a pauper instead of extending the helping hand which would prevent his ever becoming a pauper. There is no scarcity of hospitals and workhouses; and society seems to have been better satisfied with the reparation of its own neglect, under the garb of charity, than conscious of its duties and its interest in promoting health and solvency as acts of common justice. We have had to deal with disease and poverty in a manner which has been more flattering to our philanthropy than creditable to our common sense; and the delusion seems to have fast hold of us, that hospitals, workhouses, gaols, lunatic asylums, and reformatories are more satisfactory institutions than that which would to a great degree render them unnecessary,—healthy houses and the encouragement of co-operation and self-reliance.

It is to be regarded, therefore, as a most hopeful sign, that though social science is yet in its infancy as a science, its juvenile experiments should be in the opposite direction to bygone philanthropy, and tend to prevention rather than to cure.

Necessarily many of the objects proposed to be attained by the diffusion and operation of social science will only be achieved by the results gained through many experiments, some of which must be unsuccessful. If, however, there is one means by which poverty, disease, and misery may be successfully combated, and a most admirable spirit of self-reliance created; if in effect there is one movement which lays the foundation for all social improvements among the working classes and may therefore be pronounced to be one of the *successful* efforts of social science, it is that movement which undertakes to provide "improved dwellings for the working classes." For with improved and healthy dwellings all other social movements towards improvement are possible,—without them, impossible. We do not think, therefore, we are overrating the importance of the movement, if it be conceded to be what we claim it to be,—the commencement of the possibility of others, which are perhaps equally good, but not of equal importance.

The building of model cottages is not an experiment of very recent origin. In one form or another it has been tried, both by individuals and associations, in many parts of the kingdom. Societies have offered prizes for designs, and architects have not been backward in preparing designs for various descriptions of model cottages. The object hitherto seems to have been confined to the production of well-arranged houses, having a sufficiency of accommodation, and paying a fair return on money invested in them. Commercially speaking, these experiments have not been uniformly, or even generally, successful; and this has operated very materially against the adoption of model cottage-building as an investment. Much good, however, has been done by directing attention to the subject of the dwellings of the working classes, and the recognition of the need for improvement in them. How this improvement is to be brought about will depend very much on the circumstances of the various localities in which experiments may be tried. The value of land, and the demand for labour in any one place, will necessarily govern both the extent and character of any proposed experiment for the improvement of working men's dwellings. Thus, in London, the model lodging-house, or the collection of model dwelling-places for families in a block of buildings many stories in height, is the form the experiment assumes, consequent on the great value of land, and the diversity of occupations of the various tenants. But in the great provincial towns, where land is usually not so valuable, and where extensive factories give employment to large numbers of workmen engaged in similar occupation, it is possible to give a more independent character to the dwellings, by building cottages or houses not connected with each other, except by being placed in rows or terraces. Each house may then become a freehold tenement, which cannot so easily be the case when many suites of rooms are together under one roof, as in London. We propose to give an account of the scheme for improving the dwellings of working men which bears the name at the head of this article.

The scheme of AKROYDON originated with Mr. Edward Akroyd, a gentleman of well-known public spirit in Yorkshire, residing at Halifax, where his extensive factories are situate. The founder of Haley Hill Church, one of the finest as well as one of the most costly of modern ecclesiastical structures, Mr. Akroyd desired to see an improvement not only in the arrangement of the interiors of working men's dwellings, but some regard also paid to the character of their external appearance.

Ten years ago, Mr. Akroyd and his brother built a village of 112 houses, for the accommodation of the workmen in the Copley Mills, of which the Messrs. Akroyd were proprietors. These houses were built for the double purpose of offering house accommodation to the large body of workmen employed in the mills, and in order also to give them well-constructed and well-ventilated dwellings, possessing superior arrangements and conveniences to those common in the neighbourhood. The cost of each house varied from 120*l.* to 90*l.*, and they were let at rentals varying from 5*l.* 15*s.* to 4*l.* per annum. Of the whole village of Copley, Mr. Akroyd is still the proprietor; and this experiment may be looked upon as an ordinary investment, bearing an interest of 4¼ per cent. The houses are built on the back-to-back system, or what are called double houses; and this, one of the most pernicious principles of house building, is the greatest social and sanitary drawback to the otherwise successful character of the dwellings. There can be no apology for back-to-back houses; and though it is one of the common features of the country in this neighbourhood, we believe strong efforts are now being made to put a stop to the practice. Its adoption in this case seems to have been from the desire to bring the rentals within the necessary limits of the workmen's incomes; though even from this aspect we are convinced it is false economy thus to build. It may possibly enable the proprietor of such tenements (for we cannot call them houses, properly) to obtain an additional ¼ or ½ per cent. interest on the outlay more than would be derived from the erection of thorough independent houses, with a communication back and front, and with the possibility of ventilation: but some of the health thus lost, some of the feelings of privacy and delicacy thus destroyed, will bear their fruits; and in the form of taxes and rates and subscriptions, the grudging landlord will have to disgorge his extra per-centage, with compound interest, for his participation in the origin of crime, disease, and pauperism. In these remarks we do not specially refer to Copley, for the houses at this village are by far the best examples of the class that can be found perhaps in Yorkshire. Here, too, if anywhere, on the open country, it is possible to have such dwellings,—for here is fresh air to be had by opening the windows. The fair test of the system is to be found in the lowest parts of a manufacturing town, where every foot of ground is valuable, and where the factory smoke pollutes the air, and the dyehouses poison the streams; where streets cannot well be described than as canals in wet weather, and the tracks of simooms in dry weather; where it is difficult to get air at all, and impossible to get it untainted by the chimneys and the sewers; where the refuse of a thickly-populated district lies rotting on the open streets, and the gutters do duty for more than surface drainage. In such a place—and there are many—what must it be *never* to have a draught of air through the house? The Registrar-General can tell us: the record of infant mortality is a fair gauge. At Leeds, for instance, where this system of half-houses is the most common, the people have been said to succeed in everything but in making health; and it has been asserted that the rates of mortality are higher than can be accounted for, except by the explanation that the people are cannibals, and live upon each other as surely as if they eat one another.

We must, however, return to the subject of Akroydon.

With a view of improving the character of dwellings for working men in the district of Haley-hill, Halifax, Mr. Akroyd purchased, in the year 1855, a considerable plot of land, upon which he designed to build a small town, having, for its prime characteristics, beauty of architecture; a combination of all the improvements in arrangements evolved by the progress of sanitary science; and a town in which every inhabitant was his own landlord, living in his own freehold; and lastly, that these freeholders should be working men. For political purposes many working men in Halifax had already become freeholders; building houses with the assistance of the Halifax Union Building Society, who advanced three-fourths of the capital. The houses thus built, though inferior in construction and character, have so improved in value as to be worth, in some instances, nearly double what they have cost to their proprietors.

Making use of this experience, it was determined to build the new town in connexion with a local society called the Halifax Permanent Benefit Building Society. Plans were obtained from Mr. Scott; the character and style of the buildings were determined; and a local architect, Mr. W. H. Crossland, became the acting architect to the scheme, furnishing designs and carrying out the

propositions of Mr. Scott, whose pupil he seems to have been. Some delay occurred in the preliminaries, but designs were at last submitted to a meeting of proposed shareholders, in June, 1860. They were well received, and immediate steps were taken to form the Akroydan Building Association, in connexion with the last-named society. We will let Mr. Akroyd describe for himself the motives which led him to embark in the scheme, as stated by him in a paper read before the last meeting of the Social Science Congress in London. At this meeting of proposed shareholders, in June, 1860, "It was stated to the meeting that the object of the promoter was not only the improvement of their dwellings in a sanitary point of view, but also to awaken the innate taste of the people for the beautiful in outline: he therefore stipulated that the block plan (as furnished by his architect) should be strictly adhered to, and that the design should be Gothic, simple, yet bold in detail. On these conditions he undertook to provide plans, to defray all expenses connected with the contracts and supervision, and to guarantee the fulfilment of the contract within the estimate, provided there was no deviation from the contractor's plans; or otherwise that the cost of any such deviation should be paid to the contractor by the party requiring it, and at his sole cost."

Upon this understanding, in March, 1861, the contractor commenced operations for building two blocks, eighteen houses in all; and, with those now nearly built, four blocks, containing thirty-one houses, have been erected. They are of two classes. The first and less costly house contains on the basement — wash-kitchen, coal-cellar; ground-floor—living-room, 15 feet by 13 feet, small scullery; first-floor—bed-room, 15 feet by 11 feet, and bed-room, 11 feet by 6 feet. A yard at the back, 18 feet 6 inches by 12 feet, contains closet and ashpit. The guaranteed cost to the shareholders of these was 130*l.* each.

The second and better class contain on the basement—cellar, 18 feet by 16 feet, larder, 10 feet by 7 feet, coal-cellar; ground-floor—parlour, 15 feet by 12 feet, kitchen, 9 feet by 13 feet 6 inches; first-floor — bedroom 15 feet by 10 feet, ditto 13 feet 6 inches by 9 feet, ditto 8 feet by 9 feet. A small yard at the back contains closet and ashpit. The guaranteed cost to the proprietors of these houses was 150*l.*

The blocks last built are of a somewhat more expensive kind, two houses in them costing 300*l.* each, four 150*l.* each, and six 210*l.* each.

The whole are supplied with water and gas; are thoroughly drained with sanitary tubes; and each has a separate back and front entrance. Externally the blocks already built are pleasing in design, of the Domestic Gothic very frequent in the older houses in the neighbourhood, some of which date back two hundred years. The material used is the stone of the neighbourhood, which is both good and plentiful, with blue slate roofs.

The dressings to windows, doors, strings, and quoins, are out of the fine sandstone from the quarries at Ringby, on the hill just above. It is of a very soft warm tone, and harmonizes well with the intermediate external face-walling, which is composed of Northouram wall-stones, of a bright grey colour. These wall-stones are made out of the flat stone of the district, and vary in thickness from 2 inches upwards, and are cut out of the same beds as the best flags and landings. They are walled as they are delivered at the quarry: no labour is used in dressing them.

The internal walling is composed of inside parpoints and bricks. Where economy of space is required, bricks are used; the whole built in mortar. The outside walls are 21 inches thick below the ground line, and 18 inches thick above.

The roofs are covered with Bangor duchess slates, nailed with copper nails to 1½-inch deal laths. The ridge tile at present used is a Staffordshire roll one, but it is proposed to alter the form and material of them. The valley gutters and flushings are all of lead.

The fixtures provided in the houses are, for the single ones, an oven and boiler, a pan for washing or brewing, a cast chamber fire-place and mantelshelf, a sink in cellar, and one in the small scullery, foot of stairs, a large cupboard with folding-doors, and set of drawers under. The double houses have, in nearly all cases, two ovens and boilers, one in the back scullery, level with the living-room, and one in the cellar kitchen, with a pan for washing.

Papering and gas-fitting have been left to the option of the owners. The walls have all been plastered.

No wood was originally painted except the external doors; simply stained and varnished.

Mr. Akroyd is very strong in his idea of not placing all houses of one class together. He rather desires to carry out as much as possible his original scheme of mixing individuals of various grades in one community, so that the better paid and better educated might act usefully on the desires and tastes of others in an inferior social position. This has been followed in Mr. Crossley's proposed scheme, the houses being of four values, 250*l.*, 170*l.*, 140*l.*, 100*l.*

Mr. Akroyd is very desirous of keeping up the old English notion of a village—the squire and parson, as the head and the centre of all progress and good fellowship; then the tenant-farmers; and lastly, the working population.

In examining the houses already built, we were particularly struck by the singular air of neatness both in the interior and exterior, testifying to the pride which the proprietors evidently felt in living in and taking care of their own houses. In the more expensive of the two, the parlours were models of neatness and comfort, furnished in a manner which we venture to say is scarcely known in the houses of artisans in the south of England. From the completeness of the internal arrangements, and the thoroughness with which the houses seem to have been built, the whole appear eminently successful; whilst the occupants are evidently proud of their homes. One feature we were particularly pleased with. Over the doorway, on the keystone of each house, the owner's initials are carved as a monogram, which helps to give an individuality of ownership to each proprietor, and is also ornamental in appearance.

It was intended to add a more picturesque appearance to the houses by the use of dormer windows; but this the owners objected to, supposing it would tend to give the character of almshouses to their freeholds; and though the point of allowing the style to be Gothic was conceded with some reluctance to Mr. Akroyd, the idea of the eleemosynary effect of the dormers could not be overcome, and this part of the design was relinquished.

We have misgivings on the subject of cutting up the available living space into two rooms, as the better classed among the houses are planned. Practically, the working classes live in the smaller and keep the larger and better room for "Sunday best," inhabiting it only occasionally. Two fires will not be kept up in a poor man's house; and therefore during the winter months the best room or parlour is to all purposes closed, whilst the family is compelled to inhabit the much smaller room, or kitchen,—often too small to hold them all without great inconvenience. For this reason we prefer the cheaper of the two classes (excepting as to the bed-rooms), which gives a large healthy dwelling-room, and a small scullery *without a fireplace*. If a better class of house be required for the higher grades of artisan, we should strongly recommend the large room to be provided with the range for cooking, and otherwise so planned, that the inhabitants will of necessity live in the healthier room, and keep the smaller for occasional or Sunday use. Inasmuch as both classes of house have a kitchen with set pot and sink, arranged for washing and other purposes, we can see no urgent need for two fireplaces on the dwelling-floor; unless, as before stated, it be for those who can afford a withdrawing-room. The more there are of the latter among our skilled artisans the better, for more gifted workmen have been driven from their own homes to places of less profitable resort, through the want of a quiet room in their own houses, than perhaps by any other circumstance. But there are a vast number of working men whose wages are such as will always prevent their having such a luxury; and these are the most in need of healthy homes and assistance in procuring them.

It is, however, absolutely necessary, even in those houses which contain only one large living-room and pantry, or scullery, on the ground-floor, that three bedrooms should be provided on the chamber-floor. In the majority of poor men's families there will be both boys and girls of an age which makes it indelicate that they should occupy the same bedroom; and when, to obviate this recognized evil, the girls or boys are provided for in their parents' room, the indelicacy is scarcely lessened, whilst the injurious effect on the health of the children is increased. We can see no reason why the parents' sleeping-room should be so much larger than the others. Wooden partitions would be a sufficient screen for dividing the space above the large living-room into two bedrooms, leaving space for a third over the scullery and stairs. It would be, perhaps, advisable to construct the wooden screen to be removable, if when the family became less, it should be desired to convert two into one large bedroom.

Let it be understood that it is necessary to cultivate moral as well as physical health, as influences constantly and mutually reacting; together forming the mainspring of happiness, the possibility of prosperity, and the basis of civilization.

We cannot forbear noticing, for the benefit of our artisan readers, the method by which the inhabitants of Akroydon become their own landlords; this being the distinguishing feature of the scheme, from other model cottage schemes previously originated.

Referring again to Mr. Akroyd's paper we extract some information. Mr. Akroyd says,—

"The chief advantages which the Society affords are held out to parties building their own dwellings. Every builder or purchaser of property must provide one-fourth of the purchase-money, the Society generally lending three fourths. We will assume a case in which the cost of the building shall be 160*l.*, and the rental equal to 7 per cent. on the outlay: the following will be the result upon the scale of the Halifax Society:—

Subscription on *two* shares of 60*l.* each at 5*s.* per week, or 13*l.* per annum for twelve years and one month	£185	3	6
Deposit money of the one-fourth of purchase-money	40	0	0
	£196	3	6
Rental of property at 7 per cent, or 11*l.* 4*s.* per annum for two years and one month, gives (which the member will save)	£135	6	8
Net outlay (exclusive of interest on deposit)	£60	16	10

This case shows that a property of the value of 160*l.* may be obtained for the sum of 61*l.* 16*s.* 10*d.*, exclusive of interest on the member's deposit.

Or put the case in another light, and supposing the member elect to be living in a house for which he pays 10*l.* per annum rental, or 4*s.* per week. By joining the Association and paying 5*s.* per week besides his deposit—that is, 1*s.* per week more than what he actually pays for rental—in twelve years and one month he will become the owner of the dwelling-house and constitute himself his own landlord; and in the event of being obliged to discontinue his subscriptions from lack of work or other cause, he may transfer or sell his share; or in the event of the death of a subscribing member, his widow or family will have the same facility for disposing of the share.

His account with the Society will stand thus:—

Received from Society.

Purchase-money	£160	0	0
Add interest on same for twelve years and one month	36	3	6
	£196	3	6

Paid Society.

Subscriptions on two shares for twelve years and one month	£156	3	6
Paid deposit (exclusive of interest)	40	0	0
	£196	3	6

Such are the advantages held out by the Benefit Building Society; and such, we may add, are held out by almost all building societies, *without being generally made use of by the working classes*. It requires something besides the mere offer of such advantages to induce working men to take active steps to secure the assistance proffered, for the provision of 40*l.* as a commencement would be an insuperable difficulty with the majority. The technical knowledge which would be requisite in the subscriber who intended building himself a house would be a rare thing in a working man. Moreover, the artisan himself is not the best judge of what is really required for a healthy, well-planned house; otherwise we might not so often have to complain of their scarcity. It required something more than the offer of assistance from the Building Society at Halifax, and this something, and the controlling power also, were furnished by Mr. Akroyd, who further states that the additional benefits conferred by the Akroydon Building Association are,—

"First. A favourable site on easy terms through the landowner and promoter, besides uniformity of style, and a protection against the depreciation which the purchaser of a good house often sustains by the juxta-position of an inferior building. Moreover, the sites of the various blocks are carefully apportioned, and a complete main drainage is established.

Second. The attainment of *the chief and primary object* by the erection of a better class of workmen's cottages than can be secured through the ordinary channels of building speculation, such cottages being designed by a selected architect, subject to the approval of the committee of the Building Association. By employing an efficient clerk of works, Mr. Johnston, to look after the contractors, care is taken that the work shall be *well* and *substantially executed*, and that the contract be faithfully adhered to. *These are especially the points* on which a *working man wants help*, because he can understand but little of an architect's plans and details; and whatever knowledge he may have of the contractor's work, his influence and control will be very slight.

Third. Assistance in raising the deposit of 40*l.*, or one-fourth of the purchase money required. This sum may be as far out of the reach of the member as the whole amount for which he subscribes. To eligible members, unable to pay down the required one fourth, I guarantee the deposit of 40*l.* to the Benefit Building Society, who, with such security, are willing to forego the prepayment

of the deposit, and instead thereof to increase the scale of weekly payments to 6s. 9d. Of course my guarantee will cease when one-fourth deposit money has been paid in by these instalments,—say in three years. The deposit might be met in *another manner:* by each non-deposit member entering himself as a subscriber at the usual weekly rate of 2s. 6d. per share per week for three years before the money is borrowed from the Benefit Building Society, and by that time he will have accumulated the requisite deposit. Under this arrangement the building might be commenced during the third year of subscription, and be completed when the loan is made and the house ready for entry."

In addition to this, Mr. Akroyd gives the land required for the main streets, more for the purpose of initiating so valuable a movement than from any desire to more nearly identify himself with the scheme. He suggests that in all large and populous towns committees should form themselves, composed of those who desire to help and work *with* the working men, and not only *for* them; first purchasing sites in the most likely situations, and then, in co-operation with local building societies, enable working men to achieve their own independence; adding that, should the promoters who wish well to the working man derive no profit, but experience a loss in their efforts, yet "*in no other way can the same benefits be conferred on working men at so slight a loss,*—benefits which *entail no degradation and wound no self-respect, but, on the contrary, confer independence,* whilst *the achievement of the independence constitutes a* HABIT *of saving most useful in after-life.*"

How Mr. Akroyd's sensible method of proceeding has been met in a kindred spirit by the workmen of Halifax, we shall show by a quotation from the annual report of the committee of the Akroydon Building Association, dated August, 1862. After referring to the satisfactory condition of the scheme financially, the committee report:—"We may advert with peculiar satisfaction to the erection of a handsome building for a co-operative store at Akroydon. This store will be a great convenience to our resident members; and as the embodiment of the accumulated savings of working men, it will be admirably in keeping with the objects of the Association. [Our engraving illustrates the store referred to, and also two of the better class houses, with some of the cheaper houses in perspective to the left.*] Regarding the question of the cost of the houses, we may observe that, from the first, we have had no desire to provide 'cheap' houses according to the popular acceptation of the word; for a 'cheap' house, like any other cheap article, is in the end proverbially dear. Our principal aim has been to erect, on the most advantageous terms, good, substantial, healthy, and comfortable houses, replete with every requisite convenience. We have sought to improve the home of the working man, and by improving his home to improve his health, his habits, his tastes, and his character, and altogether to raise him in the social scale; and in these respects we think the houses already built are evidence that our efforts have not been entirely fruitless.

Let us, then, continue to vie with each other in advocating the interests of the Association. Let us never cease in our endeavours to obtain new members; and as time rolls on, we shall have the satisfaction of beholding homesteads springing up thickly around us, and be the means of establishing at Akroydon a community of working men frugal and industrious, contented and happy."

We think that our readers will concur with us in wishing the committee a hearty "God speed" in their endeavours. We cannot refrain from expressing our admiration for the promoter of the scheme and for the working men themselves who are carrying it out. The conduct of both is well worthy of imitation, and will undoubtedly be followed by similar efforts in other parts of the country. Already it is bearing fruits in the formation of a similar association in Leeds, to whose operations we have from time to time briefly referred, and to which we may at some future time devote a separate notice.

Two lessons may be learned from Akroydon. The first is, that men of wealth and intelligence, by the sacrifice of a portion of their time, and by the temporary loan of small sums to deserving working men, may enable them to begin habits of thrift and economy which will eventually raise them in the social scale. By initiating such movements, and remaining to succour them whilst they are yet experimental, infusing into them the weight which position and influence always bestow, and so controlling them that nothing is done which will need to be undone; by such conduct, our public men may confer benefits on working men that will be as permanent as they are beneficial.

* See pp. 116 and 117.

The other lesson is, that working men are both worthy and willing to assist in their own social elevation by the exercise of self-denial and forethought. Too often are well-intended schemes met by the assertion, that the working classes cannot appreciate such luxuries as cleanliness and ventilation, and will not deny themselves sufficiently to allow any general improvement in their ranks. Here, however, is a positive and practical denial to the theory.

THE METROPOLITAN (UNDERGROUND) RAILWAY.

THE Metropolitan (Underground) Railway, of which we gave a full account on the day of its opening,* and before, has been in working five weeks; and if the traffic, and a consequent great rise in value of the shares, are to be regarded, we did not devote more space to its description than the subject in its relation to metropolitan communications, justified and demanded. We have not in the interval, referred to certain reported defects in the working, and even in the design and arrangement, of the railway; but we might have been expected not to be indifferent to the reports, which in some journals have gone to the length of asserting that entire reconstruction of the main length of the tunnel, with the underground stations, would be necessary. An inspection of the line during the last few days however, has satisfied us that such defects as may be found, can be very soon rectified. As we have shown, this particular line can be of inestimable service as an example; and in the way of provision of new localities for habitations, by placing those districts in speedy communication with quarters in which it is and would be impossible to find or provide the places of residence under desired conditions. The Metropolitan Railway is already suggesting many other schemes. Some of these however, as not having the advantage of a line like that of the northern boulevard of our metropolis, will involve large outlay in property, added to their own difficulties of construction.

The right principle of plan to serve at one and the same time many objects of business and sanitation, is unquestionably that of an open line, like portions of the London and Birmingham, and the West End railways entering the metropolis, and in accordance with the original proposition of Mr. Pearson for Farringdon-street. Notwithstanding the existence of a Metropolitan Board of Works, the planning and regulation of London improvements are yet far from the perfection of which they are capable, even making no allusion to the decorative effect of our streets; but were the preliminaries of design properly regarded and attended to, lines of railway communication between different parts of the metropolis would originate with the authority which is charged with all works of street-improvement. Several objects might then be attained at once. At present, there is great waste of money and force, and often postponement indefinitely of one of the objects. Under a proper system, a speedy communication between two quarters of the town being needed,—and wherein steam-power could be used with advantage,—the necessary breadth of cutting through houses would be made for the railway, and for street-way in addition, on each side of it, the railway on the lower level, and the other ways on the regular level of other streets. Thus, very lofty houses could be built, which would peculiarly be free from the disadvantages which, owing to the value of ground, it is very difficult otherwise to escape, even where the boulevards are as wide as are those of new Paris,—in which capital, the connexion of the railways to one another has been unaccountably left imperfect, however not forgetting that there is the girdle line, *chemin de fer de ceinture*, and that in the street-routes, facility of passage between station and station has been the key-note; and channels for the aëration of a thickly populated town like London, would be established, such as otherwise would not exist, except along the course of the river, and of which the value would be found in diminished mortality.

In our former article, we thought fit to allude to the necessity of not overworking the staff of the Metropolitan Railway; and we felt the importance of running a greater number of trains. In effect, the company, or that of the Great Western Railway who work the line, were quite unprepared for the amount of traffic which there was in the first few days; and even yet, especially on Sundays, their arrangements are tasked to too great an extent. About 36,000 tickets, some of them returns, were issued on the opening day; and in the three first days, over 100,000 persons travelled. The traffic of the first three weeks amounted to the daily average of 29,196 passengers, and the receipts to 346*l.* per day. The receipts for passengers only, on the first two days were 813*l.*; and in the week following, they were 2,306*l.*, being at the rate of 615*l.* per mile per week. It has been estimated that the receipts, without the Great Northern traffic, and other resources, which will come into the account in a few weeks, may be taken at 32,812*l.* per mile per annum. The cost of the whole undertaking up to the present time, has been 1,329,296*l.* One account makes the number of passengers on a Sunday, 38,000. For such an amount of traffic, the number of engines brought into use by the Great Western Company, by no means sufficed; and there were some defects in the construction of the engines, though not more serious than might be looked for in machinery of any new kind subjected to a severe test.

* See p. 21, *ante*.

The steam from an engine must be either condensed or allowed to escape: otherwise there would be explosion. We stated in our former article, that the locomotives on the Metropolitan Railway were provided with condensers. By this arrangement, and that of the dampers, it was expected that so far as the subterranean portion of the line was concerned, all escape of steam could be rendered unnecessary, and that the gases of combustion would not have any outlet. However, owing to several causes, as deficiency of engines constructed, or at least brought into use; to the stoppages at intermediate stations, which, for many of the trains, are not necessary; to insufficient speed in the transit, or delay at the stations,—some of which defects have now been remedied; to the inadequacy of the condensers, and some other details of the engines, for their work; and to the bad quality of the coke used by the Great Western Company; the porters and others obliged to remain at the underground stations during long hours, have suffered severely. Passengers, at present, may travel from one end of the line to the other without the slightest perceptible inconvenience; but both at Baker-street and Portland-road, light smoke after the passage of a train, and a constant sulphurous smell, are noticeable; though they are not so bad as they were, when some of the porters who had been ten or twelve hours in the impure atmosphere fainted. It has been calculated that each locomotive had 30 per cent. more work than it could do well: the condensers therefore did not absorb the extra 30 per cent. of steam; and the cylinders, which in any case must be severely tried, have had some of their attachments forced off; and further, they seem to require, in parts, a modification in the material. By improvement in the condensing apparatus and in the dampers, it is hoped that the inconvenience at the stations may be done away with. Meanwhile, however, there are several proposals for the construction of engines to dispense with all fuel of the nature of coal or coke,—some of them proposing to heat the water by the combustion of gas. Should these different improvements not supply a *complete* remedy for the evil, we suppose it would not be difficult to perfect a contrivance for drawing off accumulated gases, in connexion with certain apertures and ducts which were mentioned in the former article. It has occurred to many persons, that, in the case of Baker-street and Gower-street stations, nothing would be easier than to remove the glass which covers the gratings over the areas at the sides of the street-footways; and some may ask why any glass was placed there. It appears that the agents of Lords Portman and Southampton urged that shops might at some day be built on their ground, and that communication from footway to shop-window would be desirable. Although such erection of shops is forbidden by an Act of Parliament, the owners of the ground succeeded in getting their view of the case admitted; and the railway was injured to a corresponding extent. At present, however, some of the glass, in the case of the Gower-street station, is removed; and there, where the chief inconvenience was felt, now scarcely any effluvium is perceptible. At Portland-road, all the means of ventilation that were provided are in use. Others might be added.

We have no doubt that in a very short space of time, the engineers will be able to have perfected every feature of the railway and its mechanical appliances for working; but it is necessary to say that we have yet to be satisfied that the Great Western Company will thoroughly acquit themselves of their portion of the work, and that all our recommendations (of which the necessity has been shown) will be considered by the Metropolitan Company. The traffic on Sundays shows no

sign of decrease, and when the summer comes, there will be great pressure on the company's staff. We must also insist that, so long as trains are run not earlier than six in the morning, and not at a cheap rate, this railway will fail to serve the working classes to the extent it should. When the line is finished to Finsbury (which it is expected to be in August 1864) the company will, in accordance with the stipulations of their Act, run at least two trains each way morning and evening, at a fare of one penny for the whole length of the line or intermediate distances. The Finsbury extension, being for four lines and in open cutting, will make a great clearance of houses. We fear that for many of those who are to be ejected from the class of habitations concerned, the Legislature did not go quite far enough. Cheap trains in the middle of the day, to allow the working-man to dine with his family, would be essential to such influence upon the comforts of the industrious classes, as is no doubt within the sphere of improved means of metropolitan communication.

NEW MATERIALS FOR THE LIFE OF SIR FRANCIS CHANTREY.*

FROM stable-lofts and outsheds, in and about Mayfair and Vine-street, Chantrey carried his clay and his bride into a house in Eccleston-street, Pimlico. Here he commenced sculptor in earnest, and here within a ring-fence of still increasing buildings, he remained from 1810 to his death in 1841. No sculptor in England has covered so much ground with his works as Chantrey covered. Clay and plaster requirements led to room for marble, for sawyers, and for masons, and these in their turn for bankers, for sculptors, and a house for his friend and assistant. Men of mark sat for their busts, and his prices rose with every fresh demand of moment on his time. His highest price for a bust was two hundred guineas, the highest sum ever asked, and the highest that has been obtained by an English sculptor since his death.

He made money with ease, and yet he was careful in keeping it. His account-books were kept by a system worthy of the Barings or Sir Richard Madox Bromley. He knew to a sixpence what each work cost him, minus his own labour. Take a bust for illustration. There was so much for the marble, so much to Cunningham for rough hewing and pointing, so much to Heffernan for carving, and bringing the marble into the state that a day's work or even less from his own chisel would suffice to enable him to send it home with a letter which required, what it soon obtained, approval and a cheque. His balance at Coutts's looking too large to lie idle, he bought into Government and more largely into East-India stock. The latter investment was peculiarly judicious, John Company, of Leadenhall-street, always favouring the claims of any sculptor for monuments in the East who held shares in East-India stock. Chantrey saw this, and experienced the truth of it in many commissions, from the statues of Anderson to those of Heber and Munro.

Chantrey had three first-rate assistants (among many assistants), better men than whom in their way and for a master's purpose never worked in clay, in plaster, or in marble. All three are dead; I will, therefore, say something about them, truly and tenderly as I remember them. Fine, frank-hearted Frederick Smith (son of Anker Smith, the engraver) was his right-hand modeller. Fred's soul was in his art,—unhappily his ambition was limited by the necessities of the week, or, had life been lengthened to him, he had risen to a high rank among English sculptors. Two of his busts—both in marble and from his own hand—will preserve his memory: his busts of Francis Chantrey and Allan Cunningham. Fred Smith knew by heart the features of the men he modelled; he saw them in all moods—in sunshine and in shade,—and has caught the two men, living as they thought and spoke, and sat and moved. When at the Academy, Flaxman's fine lustrous eye fell on Fred's bust of Allan Cunningham, this great sculptor of Michael and the Micheldever monuments, expressed higher approbation of it than was common with his Yorkshire nature, large and generous as it was. Fred's bust of Chantrey was one degree less excellent than that of Cunningham, and that is saying much. My mother has still her husband's bust; Lady Chantrey retains, I believe, the bust of Sir Francis.

James Heffernan, of Cork, comes next before me. I see him in the flesh, as it were, working at his banker by the side of the never-paid-for Hafod monument. He was a consummate master in transferring a look from dull, dead clay to semi-transparent Carrara marble. He saw, and caught, and translated Chantrey into another material. Strange to say, he was only good at a bust. Very marvellous it was to see James Heffernan at work. So sure was he by long servitude and natural confidence and skill in the certainty of his touch, that he would laugh a good Cove of Cork laugh, throw his Irish soul into any little merriment that might be passing, and then resume the chisel and hammer on features where a touch too heavy could never be recalled, and the labour of weeks (to say nothing of the price of the marble) be made entirely valueless. Dear old James's wife wrought me when a boy a sculptor's apron, and I was to have been a sculptor.

"How many an Ovid was in Pulteney lost."

If Mrs. Heffernan could have had her will, I might by this time have been either a full-blown "esquire" in Trafalgar-square, or only a discontented "Mister" and expectant "A.R.A."

Joseph Theakstone, a fine, venerable, kind-hearted man, ever prompt with a kind word and a kind smile: he too is no more—though seemingly in the flesh before me. Theakstone lies in the general cemetery at Kensal Green, not far from my father. He came to Chantrey a thorough master in his art, for he had wrought, and with high wages, in the studio of the elder Bacon. He was a consummate master in making marble convey the qualities and surfaces of silks and satins, velvets and ermines. He played no Phidias or Gibson-tinted Venus tricks—had no secret in his art (what great master ever had?), for he allowed all who cared to see him at his work. Heffernan could not do this—nor, I have heard my father say, could Chantrey, great master as Chantrey was in working marble. What will our Ruskins and others call this excellence in Theakstone—not a fine eye for colour, rather, may I be allowed to suggest, a fine sense for the qualities of texture; but I am wandering, and must fall once more into what the elder D'Israeli called (happily enough), his *anecdotage*.

In the summer of 1831, whilst my father was busy with the sixth and last volume of his "Lives," died John Jackson, R.A., one of Chantrey's very few friends in the Royal Academy, a man always welcome in Belgrave-place. Of one so eminent and so newly dead, my father thought, and very wisely, that the world would like to know something; and Lord Dover, Jackson's great friend, offering his assistance, the Life was undertaken. Chantrey, then in Yorkshire, was written to for help, and a few extracts from his memoranda, half ink, half pencil, will be found interesting and instructive:—

"Jackson was easy and accommodating to a fault. During our journey to Rome, I never saw his temper ruffled for a moment; whatever we did he approved of it; and whether we went to the right or to the left, it was all the same to Jackson."

"I consider Jackson's portrait of Canova* as one of the finest specimens of true character and true colour in modern portraiture."

"In Venice, Jackson spent most of his time in contemplating the works of Titian and Tintoretto, in whose works the finest colour is combined with the finest composition; the latter painter rose much in our esteem. In England we know but little of his merits; he is high in all things where he ought to be high. Jackson, though a silent man, was eloquent here; indeed on all subjects of a professional kind, he showed good judgment, and often surprised by his remarks on works beyond the ordinary line of his studies."

"The late Lord Carlisle bought Jackson's portrait of Northcote, and placed it in the next room to that which contains the head of Snyders by Vandyck; and our countryman's reputation for fine colouring loses nothing by the comparison."

We will now hear Chantrey on his own art,—bust-making:—

"The busts at Cambridge by Roubiliac impressed me at once with a veneration for the genius of the artist. I know of no works of that kind which may be safely compared to them. They have a manly air and vigorous freedom of manner, which proves to me that he treated them rather in the manner of the heads of statues than as domestic portraits, where fidelity of resemblance is more aimed at. Those who have not seen the Cambridge busts, and, above all, the statue of Newton, are strangers to the best works of Roubiliac."

To this I must add what Chantrey thought was the best of Nollekens's many busts, the bust of Dr. Johnson: and he illustrated his opinion by purchasing the original cast of the bust at Nollekens's sale; the loose bold treatment of the hair (copied from a beggar) he thought amazingly fine.

Nor, when accompanied by an anecdote, will the reader dislike to hear what Allan Cunningham looked upon as the best work of his old master. When Lady Chantrey was distributing among Sir Francis's friends little memorials of her husband, Lady C. selected for my father the small clay model of "The Sleeping Children," a very valuable memorial of Chantrey, still in my mother's keeping. When my father showed it to me, I asked him if he had made his own selection? "No," he replied; "if I had made my own selection I should have taken the model for the small-sized James Watt—*not* the model for the large one."

It was Chantrey's custom before commencing a bust to invite his sitter to breakfast. He liked to see his sitter with his morning looks on, and in conversation, and without the remotest idea that he was sitting for his portrait. He thus caught the every-day look of the man. After breakfast the company adjourned to the studio; the sitter's face was caught mathematically in the camera, and then the clay (already shaped into something like a human head) was commenced. The sitter so called was not put into a throne or vice, but allowed to wander within easy shot. Clay was then manipulated into life, and the bust, as far as the so-called sitter was concerned, unconsciously completed. Southey has told this well in his noble "Epistle," in verse addressed to my father.

Horses and women troubled Chantrey in his art. He has left us three horses concocted from "all the king's horses" in the mews at Pimlico. First, there is the Trafalgar George IV. horse, the sire of all; then the Madras Munro horse, very like his father; and then the Wellington Mansion horse, very like his grandpapa. His female busts, only two in number, raise a regret that we have not more of them. His Mrs. Somerville is very fine, while his bust of our beloved Queen, executed in illness and old age, is still, to my thinking, the best bust of her Majesty Queen Victoria. What does Mrs. Thorneycroft say?

A love of money in old age may be excused in a man who was eager to obtain money to leave it as Chantrey left his money. That this love of Mammon grew on Chantrey in his latter years and at a rapid pace there cannot be a doubt. Losses in Pennsylvanian bonds and half-successful intrigues for Government gun-metal for his Wellington statue (free, gratis, for nothing), embittered his latter days. Strange, that three great contemporary English sculptors should live married and die childless—Nollekens, Flaxman, and Chantrey, men of name—surviving only in their marble progeny.

Chantrey died so suddenly that an inquest was held upon his body. I was present. It was a solemn sight not to be effaced whilst unimpaired remembrance reigns. In an exquisite little gallery built for him by Sir John Soane, lay (seen by many lighted tapers) the breathless body and torpid hand that had given life to helpless clay and shapeless stone. Around the body in its winding-sheet were ranged some of the finest casts from the antique that money and taste could procure. Calm and solemn was the scene. My father kissed the cold forehead of his friend with these words—"My dear master." I looked into his eyes as we left together—they were full of tears.

PETER CUNNINGHAM.

* Where is this portrait?

"THE LONDON ARCHITECTURAL SOCIETY." 1806.

MR. JOSEPH WOODS.

THE paragraph which appeared in our pages recently concerning the earliest architectural Society in London (p. 86, *ante*) having come to the notice of Mr. Joseph Woods, author of the third volume of Stuart's "Athens," and "Letters of an Architect from Greece and Italy;" the architect, too, of the Commercial Sale-rooms in Mincing-lane, and now living at Lewes, he thus writes to an esteemed member of the profession who had commented on it to him:—"You are quite right. I was certainly the J. Woods, jun., mentioned in the *Builder*. I had at one time two copies of our essays, but they have disappeared, I do not know when or how, but certainly at least thirty years ago; and, therefore, I can only speak from memory, which does not quite agree with the list of members given. James Savage was certainly one, and Edmund Aikin, also Samuel Beazley. I saw a good deal of him about that time. Billing and

Birkhead, no; Bubb, a sculptor. Charles Augustine Busby had been my fellow pupil at Alexander's. Cood, maker of artificial stone. Lowry, the engraver, we used sometimes to see, but I doubt if he was a member. Perry, no. Schroder, a sugar-baker. I think neither of the Smiths. Josiah Taylor, the bookseller, was one. J. Wallen was also at Alexander's, but whether he was a member or not I do not know. I think there were one or two more whose names I cannot recall; but Joseph Parkinson was certainly one of us. We published separately a book on the Doric order, written by Edmund Aikin, which brought us into trouble, for Wilkins got an injunction against it. The statements did not profess to be original, and Wilkins was largely quoted; but there happened to be one place where he was not cited, which induced the Court to grant the injunction. Afterwards Wilkins consented to withdraw his opposition on condition that his crotchet about the Temple of Solomon as a Doric building should be omitted in Aikin's book. N.B. This was not the passage on which the injunction was granted."

In the "Essays" of the Society, now before us, dated 1808, the list of members given agrees exactly with that in the paragraph already printed; so it may be either that Mr. Woods's memory of things fifty-seven years ago fails a little (who will wonder if it should?), or that he speaks of those who actually founded the society in 1806.

The volume of Essays comprises a preface, the rules of the Society, and four memoirs, in the whole 151 pages.* The preface gives as a reason for the establishment of the Society that in England, architecture has been considered rather as a trade than as a science; that among the institutions established there is not one which has appeared calculated for the encouragement of architecture:—"The feeble protection afforded by the Royal Academy can hardly be deemed an exception," it continues. "The lectures have long ceased, and medals privately distributed, and the use of a library for a few hours one day in the week, at a time when it is hardly possible for the student in architecture to attend, and that interrupted by long vacations, cannot be deemed of much value;" while the "few clubs which have been formed by persons in the profession, are rather to enjoy the pleasures of good fellowship among men engaged in the same pursuit, than for the advancement of the art."

The subscription was two guineas annually; the meetings were held fortnightly, from the last Friday in October to the first Friday of meeting in May. An ordinary member absent two nights incurred a fine of five shillings. Every ordinary member had to produce, annually, an architectural design never before made public, with critical and explanatory observations, under forfeiture of two guineas; and an Essay on some subject connected with civil architecture, or forfeit half a guinea. The Essays in their published volume are these,—On Modern Architecture, by Edmund Aikin (read October 3rd, 1806); On the Rise and Progress of Gothic Architecture, by Samuel Beazley, jun., 76 pages (December 12, 1806); On the Situations and Accompaniments of Villas (February 20, 1807); and On Dilapidations (January 9, 1807, a foundation for after works on the subject), both by Mr. Joseph Woods, jun.,—the estimable and accomplished gentleman whose letter dated a week ago, firmly and beautifully written, we have just now quoted. "It is charming to see my old friend Joseph Woods," writes Professor Donaldson (surely both of them will forgive us for a friendly breach of confidence) "seated in his study finishing up some of his Grecian studies made above forty years ago, and discoursing of arts and artists with grace and vivacity, and of reminiscences, when we were together at Rome, and were meeting Canova, Camuccini, Thorwaldsen, and like men of mark there; with John Soane, jun., Basevi, Boud, Saunders, Geo. Rennie, the sculptor, and other such now passed away. Hardwick and myself used to go to his rooms, and we read Goldoni and Alfieri together, and battled it out on many questions of taste regarding Greek and Roman architecture."

Such peeps backwards and notes of old friendships do us all good. The day after he penned this memorandum the Professor was busy in Oxford, valuing the property of Christchurch, for assessment to the town rates, having been appointed the valuer by the Poor-law Board; as he was, two years ago, the referee to decide the assessments of the Colleges and University of Cambridge. And so he unites the artistic, the genial, and the practical. We have fallen into a gossip somewhat personal, and perhaps need an excuse, but we could not resist the oportunity to acknowledge the value of the early labours of "Joseph Woods, jun.," now eighty-four.

* "Essays of the London Architectural Society. With four plates. Published by order. London: sold by J. Taylor, at the Architectural Library, No. 59, High Holborn. 18°8."

SOME PARTICULARS OF CURRENT COMPETITIONS.

Westminster Chapel.—Twenty-one or twenty-two sets of designs were submitted in competition to the committee entrusted with the rebuilding of Westminster (Congregational) Chapel, James-street, Buckingham-gate. The shape of the ground, existing schools, the required accommodation of 3,000 persons (2,000 in pews, and the remainder in free sittings and standing room), and the limit of expenditure, to 10,000*l.*, including architect's commission, and salary of clerk of works, interposed considerable difficulties. No premiums were offered, but the committee undertook to enter into an engagement with the successful competitor to carry out the work, "if executed, at the usual commission." The plans were to include, with other accommodation, a lecture-room, capable of seating about 600 persons. The greater number of the designs are of the poorest character. Not more than half a dozen have any claims to consideration. The set of drawings selected, marked Y. Z., are by Messrs. Poulton & Woodman, of Reading; but which of them are to be carried out seems not decided; and inasmuch as they include a geometrical Gothic elevation with spire, a design with a portico of six composite columns, and a sketch of a building of Wren-ish character, with steeple, it is difficult to say what the design really is. If the Gothic elevation be adopted, as is said to be likely, a fresh design will be required for the interior. The interior view exhibited includes two tiers of galleries, and a panelled ceiling more than sufficiently ugly. The plan, a parallelogram, with rounded ends, appears to have weighed with the committee.

The design marked "P. Q. 27," is a more artist-like production externally, with a detached tower, and in other respects showing a resemblance to the church in Garden-street, hard by. The plan may be roughly described as ⊔ shaped, and may have induced fears as to acoustical results. "*Au bon droit*, 1 and 2," one of the sets marked "Westminster," and the set "Ahithophel," have merits.

Cork Cathedral.—We are invited to take part in bringing to the decision of a court of law the legality or otherwise of the conduct of the committee in this competition. It seems to us, however, on careful consideration of the circumstances, that such a step would be futile, even if it be called for; and this some of the English competitors have already stated. We gather from the letters addressed to us containing objections to the selected design (Mr. Burges's), such as the smallness of the piers supporting the central tower, and the absence of a chapter-house,* that the ground taken for legal action is the fact that architects were "invited to furnish designs for the erection of a new cathedral, *at a cost not exceeding* 15,000*l.*," and that the first premium has been awarded to a design the cost of which would be double that amount. This, even without qualification, would be insufficient to maintain an action.

In the printed particulars accompanying the selected design, we find the following paragraph:—

"From the position of the proposed building, on the top of a hill, whence it will be seen from the whole town, it becomes a matter of necessity to have three spires, as well as to carry off the height and shortness of the building itself. Of course, it would be impossible to execute these and the church for the 15,000*l.*, and they must, therefore, necessarily be left to the piety of future generations: at the same time, two or more low towers would only impoverish the building, without any corresponding effect." †

And we understand it has been shown to the committee that the edifice, properly roofed in, and ready to receive the completion of the spires when money is forthcoming, may be erected in accordance with the design selected for the suggested 15,000*l.*

New Iron Bridge at Stamford.—It is proposed to erect an iron bridge over the river Welland, at Stamford. Plans were advertised for, and seventeen were sent. From these four were selected, including one by Mr. Wright, of Sheffield, and one by Mr. Page, jun. They were submitted to the Marquis of Exeter, and Mr. Wright's design has been adopted.

Limerick County Gaol.—On the 31st ult. the premium of 50*l.* was awarded to a design, by Mr. Atkins, architect, Cork, for altering the Limerick County Gaol so as to provide separate cells for 100 prisoners, and a new house for governor.

Kenilworth Church.—Designs for the restoration have been submitted to the committee from Mr. Beasley, Mr. Edgar Brooks, Mr. Dolby, Messrs. Wilson & Walker, Messrs. Nevill & Son, Mr. T. Pratt, Mr. Murray, and Mr. Smith, Adelphi Chambers, London. The committee, after examining the respective plans, determined upon accepting that of Mr. Smith.

Broughty Ferry Free Church.—We hear that the Building Committee, after having offered a premium of 10*l.* for the best plan for their church, and received competition designs from Mr. Heiton, Perth; and Messrs. Edward & Robertson and Mr. A. Kidd, Dundee; have selected the design of Mr. Heiton. The cost is supposed to be about 3,000*l.*, exclusive of the ground, and the accommodation about 600 sittings.

Swansea Public Hall.—Designs have been submitted by Mr. Jowett, Mr. Richards, Mr. S. Edwards, and a few others. The design of the last-named gentleman is thought to be put out of court by its costliness. The sum of 3,000*l.* is named by the directors.

Albert Middle Class College.—Mr. Peck's design was chosen, and he has been directed to take out the quantities with a view to obtain tenders.

* The particulars say Chapter-*room*; and this is provided.

† As a note to this paragraph, in MS., are the words:—"In actual construction the piers of the towers should be slightly increased."

BRITISH INSTITUTION.

VERY little can be said in praise of the present collection of modern pictures, at the British Institution. Taken *en masse*, its pretensions to consideration as an exhibition of the average capabilities of those members of the profession whose interests it ought or might most immediately subserve,—namely, young painters, and others belonging to none of the societies that ensure opportunities of exhibition and sale elsewhere,—are, this year, even more limited than usual.

If anything like a fair inference could be drawn from the inspection of such a heap of "nothingness," such an aggregate of unprofitable labour as this, wherein mediocrity is distinction, and promise or progress even as rare as pearls amongst oysters, there would be little to encourage a hope that the few pictures of the few of its contributors entitled to honourable exception may really illustrate a more general though latent ability amongst the many; and that others in whom that ability most unquestionably exists, may not be represented at all adequately. Another cause for its shortcoming lies in the poor measure of assistance afforded it by artists of mark and established position. Some just barely present are less conspicuous than others are by their absence altogether. Mr. E. W. Cooke, A.R.A., for instance, aggravates whilst he delights, in his exquisite little production (119), "Trabacolo waiting for Tide off the Armenian Convent, Lagune of Venice, Sunset," so perfect, though so small; and Mr. R. Ansdell, A.R.A., sends but one composition (20), "Crossing the Moor," which, though remarkable enough in itself for some beautifully drawn sheep, is poor compensation for his customary two or three of much greater importance and dimension. Mr. T. Sidney Cooper, A.R.A., on the contrary, has adopted a larger scale than usual with him; and in 60, "Catching Wild Goats on Moel Seabod, North Wales," cleverly enunciates his thorough comprehension of the distinctive characteristics of this variety of the species. Mr. G. Lance, too, has increased the size of his canvass; and, ever faithful to the occasion, is as unapproachable in the arrangement of fruit and golden goblets as he is unrivalled in the depiction of them when so arranged. No. 239 may be ranked amongst his most signal successes.

Amongst the known men who continue their support, Mr. T. F. Dicksee must be mentioned for three or four of his agreeable idealities. Of these (427) "Lady-bird" is incomparably the best, and charmingly pretty it is: (27) "Rose-buds and Roses," too, is an excellent portrait of a child. Mr. Gale, not so regular a contributor, provides one of the gems in his perfectly finished (429) "Greek Pilgrim." Mr. J. Hayllar would doubtless have been more successful with any episode more capable of pictorial elucidation than (283) "A Practical Joke," which is nothing more nor less than the time-honoured romance telling how

✠

Cromwell's chaplain saved himself from the consequences of making love to the Lord Protector's beautiful daughter, by declaring that his affections were concentrated upon Abigail, her maid; to the end, that he was precipitately obliged to marry the same Abigail. There is so much of promise in this picture, that such an error of judgment is to be deplored. (305) "The young Raffaelle showing one of his works to the Duchess of Urbino and Sora," by Mr. D. Wilkie Wynfield, if the production of a young man, may reasonably encourage expectations of something better to follow, and shortly. It shows independence of manner, and is therefore in striking contrast with another exceptionally excellent work (366) by Mr. E. C. Barnes,—

> "Oh! we'll not joy, but strive in vain,
> To light up those glaz'd eyes again."

This might have been cited as the most powerfully conceived and painted composition in the gallery, were it not so closely imitative of the style of a better-known artist; and would have placed its author high in that class of delineators in which his prototype takes the lead.

Again, Mr. J. Holland's (98) "Venezia," and (115) "The Lion of St. Mark," are valuable items; and the admirable English landscape (164), "Milking Time in the Evening," by Mr. T. Danby, and a brilliant sunset entitled (345) "Cornish Wreckers," by his brother, Mr. J. Danby, are amongst the redeeming features.

Mr. Frank Wyburd's (182) "Xarifa," scarcely sustains the promise of former works: he appears to obtain results too easily, and sacrifices substantiality to littleness and pretty manipulation. (197) "Mira," by Mr. A. Ludovici, graceful and, to some extent, delicate; and (218) "Edgar," by Mr. H. Weigall, very firmly painted, and, if a portrait, considerably removed from commonplace, form attractions amidst much barrenness; and the small contributions—(232) "Little Red Riding Hood," of Mr. H. Le Jeune, and (247) "The Name on the Tree," of Mr. G. D. Leslie—are welcome on the same account. The latter shows more of his inherent taste and ability in (288) "The Lost Carkanet," which, for its originality in educing a story, merits closer attention.

(252) "Passing into the Shade," by Mr. G. H. Boughton, is invested with extra interest by its associative narrative, and is a singular instance—the only one present, indeed,—of the value of exalted sentiment.

Mr. H. Dawson is as easily identified in (47) "Chepstow," as much perhaps from repetition of favourite clever atmospheric effects, as Mr. Frank Dillon in (136) "An Egyptian Well," for his peculiar graphic adaptation of Eastern scenery; and Mr. Harry Johnson equally consistent with local truth, claims recognition in (151) "The Olympæum and Acropolis of Athens, from the Banks of the Ilissus;" and still more forcibly in (360) "Ruins of the Temple of Minerva Sunias, Cape Colonna," the better performance of the two. (8) "The Cathedral and old Castle of Limburg," by Mr. G. C. Stanfield, and (215) "The Minne Water, Bruges," are both noteworthy examples.

(335) "Castle Garth, Newcastle," has afforded Mr. E. J. Niemann an opportunity for dexterity and broad execution, and his large panoramic view of (571) "Newcastle: Autumn Morning," is a wonderful proof of the facility with which he executes.

In the treatment of such a subject as Mr. R. Collinson has selected (41), "Ordered on Foreign Service," refinement, as well as a due observance of probability, is indispensably requisite; and any amount of elaboration bestowed upon its production can never atone for the want of such. He is far happier in (276) "A Summer Ramble," and leaves nothing to be desired. Mr. W. F. Yeames deserves high praise for his (81) "Bravo." Echo answers everywhere, "Bravo!" (118) "Children Playing," E. Davis, has a natural freshness about it which calls for remark; and (134) "Past and Present—The Prior's Room at Bradenstoke," is one of the cleverest of Mr. A. Provis's clever interiors. (140) "Auld Lang Syne," could hardly be ascribed to its author, so insipid is it, and unlike anything Mr. J. Clark had hitherto done; whilst (143) "Brimstone and Treacle" evokes a wish that it may never be succeeded by any such mistake again; especially as Mr. J. Morgan shows aptitude for much nobler themes. (152) "Jeanie Deans," as portrayed here by Mr. J. Craig, is winsome enough to be mistaken for her sister, "The Lily of St. Leonard's."

Further on in the catalogue (316) "The Dismissal," by Mr. C. Rossiter, is evidence of the effect produced by acquaintance with the French school, and which (383) "The Gamblers," by Mr. J. Payton, will corroborate; while by antagonism perhaps, Mr. W. Hemsley, in (479) "The Path across the Common," makes it more evident, his picture being thoroughly English, and a very admirable and sufficient basis to argue upon.

LECTURES ON SCULPTURE AT THE ROYAL ACADEMY.

On Monday, the 9th inst., Professor Westmacott, giving his first lecture, made some preliminary remarks upon his renewing, at the request of the Academy, his duties as lecturer. He then addressed the younger students upon the responsibilities they had incurred by devoting themselves to the pursuit of art; and pointed out to them the varied qualifications that were necessary; first, for their attaining excellence in the technical requirements of sculpture especially, and next for their exercising their art in a noble and elevating way, by which its effect on the feelings and sympathies of the public may be secured.

The younger students had then explained to them the principles of the system of instruction followed in the Royal Academy, comprehending efficient teaching in drawing and modelling, under able masters, in the schools of the antique and living model; and the theory of art of the respective branches of practice which the lectures of the Professors were intended to supply. The *rationale* of such division was shown in the distinction that was to be recognized between the merely mechanical workman and the student who aspires to be a real artist; who desires to exercise his intelligence as well as his hand. It was explained how the teacher in the schools might be a thorough master of all that relates to the technical, but might not be competent or qualified to lead the student to a knowledge of the principles which are indispensable in his especial branch of art, and which should guide him in his future practice; precisely as it is quite possible that the most accomplished inventive artist might not always have the peculiar qualities, the tact, the facility, in giving advice and instruction to young students, that go to constitute a good teacher.

The importance and value of true principles in the practice of sculpture, in the works of some of the most celebrated masters in execution, was illustrated by a reference to the works of Bernini, Corradini, Giov. di Bologna, Roubiliac, and others, in whose productions are found the most egregious faults of principle, as regards their art; in confused compositions, flying draperies, exaggerated action, curiosities of mere execution, in veils, nets, and lace; perspectives, and all the picturesqueness attempted but not achieved of landscape, storms, sunrises and sunsets—subjects that the painter's art may represent with some degree of success, but which are utterly beyond the reach of true and pure sculpture. So, while the teacher or master is qualifying the student in the schools, in anatomy, in the knowledge of form, in drawing and modelling, it is for the lecturer to explain to him the principles applicable to each branch of art, and the right way to apply the technical power he has gained. His duty is to prove and illustrate his doctrine by a reference to the productions of celebrated artists and schools.

Executive power in drawing, modelling, and carving, though of the highest importance, should be considered only as a means to an end. Some, unwisely, and fatally to the progress of high art, fancy that when great skill is attained in this all is done. But many a perfectly executed production, most admirable in handiwork, may be utterly worthless as regards the higher object which every work of art should have in view, namely, to address the feelings, and to incite refined emotions in the spectator. A work may possess every academical quality, and yet be deficient in invention, expression, taste, refinement—in all, in fact, that constitutes the real æsthetic element in art. The creative power cannot be taught in schools or elsewhere. Its possession constitutes genius. This is not, however, of every-day occurrence; and even this may be excited by careful training.

Sculpture especially requires to be practised on the principles proper to it. The very simplicity of its means of addressing the sense—Form only,—necessitates the greater care and caution in this respect. The consequence of neglecting these is evident, as has been referred to, in the works of some of the most eminent modern sculptors after the sixteenth century. They are only valuable as warnings. No one copies them, no one collects them, no one makes casts of them; no master who understands sculpture would venture to place them as examples before his pupils. While the value of principles is shown by the estimation in which competent judges of all times hold such works as are found to possess certain qualities admitted to be essential to the art and to constitute its excellence. From such productions a Canon or code of laws has been formed for the guidance and direction of artists; and one of the objects of a lecture is to point out to students the causes of the superiority of the most approved monuments of the art that exist. Though this teaching may run parallel with that of the schools, students well know that their attention could scarcely be secured to both at the same time. Hence the division of labour referred to.

Many adverse influences of a technical kind embarrass and impede the success and progress of really high art in sculpture in modern times. The exceptional use of the nude form, arising from our habits and our non-acquaintance with it, is one of these. Also, when drapery is used the modern costume is most unfavourable to sculpture; and, thirdly, the prevalence of portrait, seeking individuality, acts injuriously on the possibility of inculcating a love for the generally Beautiful. The next great drawback is the absence of high moral impulse in sculpture. The great artists of antiquity, as well as those of the Revival, caught this from the people. They but illustrated and met the popular wants. Our artists usually must take their impulse from the public; but it is a public that has no lofty aspirations in this direction, no knowledge of or feeling for a high quality of form; and the consequence is, that the kind of art produced affords little hope that sculpture will meet with the kind of encouragement popularly that will restore it to its true position. It is said sometimes that artists ought to educate public taste; but are artists always and necessarily competent to do this? Must not they be educated? In what do artists, as a rule, show their superiority? Must not the teacher have been taught? This knowledge is not intuitive.

The whole character of sculpture underwent a fatal change in the sixteenth century, when it became *academical*, the causes of which will be more fully explained in a subsequent lecture. It is sufficient here to say the whole object and direction of the art was changed. As a rule it has appealed to the eye, or been produced to please real or pretended connoisseurs, or used for mere architectural decoration,—never, or seldom, addressed to the heart or to the sympathies of the people. Thus it was constantly seeking new modes of presentation. Fancy or fashion influenced its practice; it was constantly changing. From this period sculpture has, in truth, had no settled position. Considerable power has been exhibited in all the mechanical or more artistic requirements of the art, but it has not made its impress as the language of thought or feeling of an original kind. Where it has been used for illustration, subjects have been hunted up from obsolete sources, usually ancient mythology and poetry, in which the artists have not believed, and whose works, therefore, wanting the earnestness of truth, are simply clever and well-executed imitations or repetitions. Or, in place of this conventional art, every means is employed to attract attention, careless of the power of discrimination in a public notoriously ignorant and uneducated in the true principles of sculpture; elaborate workmanship, sensuous subjects, unmeaning figures,—on one side exaggerated, on the other, insipid,—and, worse than all, claptrap tricks are employed, as a means of producing effects, totally apart from and independent of sculpture proper.

The importance of this subject, as respects the future of sculpture, was strongly urged upon the students. The history of the degradation of the art, from the time this false influence first appeared, is sufficient to awaken interest in the subject, in all who desire to see so noble an art restored.

The art still is capable of renewal. But it must be practised upon different principles to those which have influenced its uncertain existence for many years past. We must recur to purer sources of inspiration. Subjects must be found, and felt, by modern sculptors, as they were presented to the great artists of former ages. The Greek employed his art in the honour of his religion and to glorify his gods. The sculptor of the revival used his art in the service of that purer Christian religion which filled his heart and mind; and how exquisitely, in spite of his want of academic or artistic forms, he treated the subjects he illustrated, all must admit who have examined with attention the numerous works of the early Mediæval schools, spread over Italy, England, France, and Germany. Our own sacred volume, the Old and the New Testaments, afford us art inspirations surely quite equal to the Pantheon of a gone-by and false mythology. It has been shown, by some few

sculptors of modern times, that it is possible to effect this change. Productions might be quoted, if necessary, that may safely encourage others to take a higher aim than that of merely reproducing worn-out illustrations. It is for the rising generation of sculptors to redeem the age from the reproach of constantly running in the old worn-out track, and to show that a beautiful art may still be exercised in a way to address the feelings, the sympathies, and the understanding of the people.

FINE ARTS IN ANCIENT IRELAND.*

NONE but those who seem to be of opinion that out of Ireland "cometh no good thing" can doubt that in ancient times a high state of art-cultivation there existed, whatever degree of general civilization may have accompanied it; and that eminence in art could only co-exist with some considerable degree of general civilization one cannot but admit, since the history of the whole world indicates as much; although high art, in ancient times, has certainly also co-existed with much that was savage and otherwise what we would decidedly call uncivilized. But so it is even now, and in England, too: a few hundred years hence, doubtless, it will be a general opinion that, notwithstanding our eminence in the mechanical and other arts, we were a set of semi-savages. As for such art as that displayed in ancient Irish metalwork, of which more especially Mr. O'Neill gives coloured and other illustrations, we are very much inclined to think with him that,—

"If our modern workers in metal could show as much art power, and use it as skilfully, their works, even if based on common bronze, would be of many times more value than so much solid gold; but, now-a-days, the mere intrinsic value of the metal is generally the first consideration: 'Is it solid gold?' is the primary question: the artistic part is not heeded, simply because decorative art is not properly cultivated. Not so the Irish workers in metal: with them the artistic part was everything: the intrinsic value of the materials was not minded by these talented men."

As to how the ancient civilization of Ireland sank into actual semi-barbarism Mr. O'Neill has but too feasible a theory. The conquest of Ireland, he urges, took hundreds of years fully to accomplish: the severities, and the ruthless treatment of the "mere Irish" for so long a period practised by the English conquerors, degraded the people and retrograded their ancient civilization; and it is only of late years that a very different line of policy is making some amends for that long-continued "injustice to Ireland." We fear there is but too much truth in this theory: at all events, that in Ireland, six hundred years ago, and for an indefinite period previously, there existed a peculiar order of civilization which thereafter gradually sank and expired, there appears to be every reason to believe, notwithstanding the exertions of Dr. Petrie and others to disprove the existence of such a state of civilization.

Of the art displayed during this ancient period Mr. O'Neill admits the defects, but upholds the great merits with all the enthusiasm of a true Irishman.

"We find," he says, "that, in figure, the remains of Irish art are defective; but, in ornament, they show that, in a knowledge of the sound principles of art, in breadth of effect, united to richness of detail, in fertility of invention, and delicacy of execution, the Irish artists were consummate masters, and have, perhaps, never been equalled by those of any other nation; that they excelled in colour as well as in design; and that they, probably, coloured their public buildings and monuments."

The total absence of a Christian character in Irish ornament, as he remarks, has an aspect of Paganism. This he accounts for by answering that the style was established long before Christianity was introduced into Ireland; that on the change in religion being made, the Irish artists employed their style for Christian purposes; that objects, such as the serpents—which originally had a special religious significance among the Pagans—had gradually lost that significance, and become, in the eyes of the multitude, mere objects of decoration; or, even if the converts regarded them in the Pagan religious way, we know that the missionaries of old knew how to wink at some minor matters, in order to effect the great purpose of Christian unity.

That the peculiar form of the Irish cross is heathen, and was a sacred symbol with the Pagans, we have already mentioned: that it has been continued among the Christianised Irish, and used as a sacred emblem we admit; but that does not prove its Christian origin any more than the urn which we see placed on a modern tomb, or marked on the seal of a mourning letter in this Christian age, is, therefore, an emblem of Christian origin: on the contrary, we know that it originated in the Pagan custom of burning the dead, and collecting the ashes into an urn, and hence the urn became an emblem of death; and thus we hold that the character of much of the Irish ornaments, and the particular form of the Irish cross, had their origin among Pagans: this symbol signified Bel, Baal, or Apollo; these being names for the god of the sun, whose annual, or annular course, was indicated by the ring, and the seasons by the crossing lines or quarters. In like manner the serpent was sacred, because that animal sheds its skin annually; and for some other equally superstitious reasons: even the plain cross had a sacred import, as indicating the sun's crossing the equator. Thus it was that, among illiterate nations, symbols were devised to supply the place of words. . . . .

Our conclusion is that Irish art arose some hundreds of years before Christianity was introduced into Ireland."

We do not like Mr. O'Neill's very shallow and Higginsite allusion to the sun "crossing the equator," and all the nonsensical stuff usually associated with such attempts to explain the reverend and exceedingly ancient symbol of the cross; although we freely admit that the evidence is irresistible that it was used as a religious symbol for ages previous to the birth of Christ; and hence was "Pagan," if you will, in its origin. Moreover, "Great is truth, and it will prevail;" and we are quite ready even to strengthen Mr. O'Neill's opinion that the Irish wheeled cross is probably Pagan in its origin, by pointing out to him another sort of meaning in it, if he can himself deduce that meaning from the fact that the wheeled cross may be seen on the Assyrian sculptures in the British Museum, where it is essentially associated with the presiding genius or supernatural guardian, or angel, of the king; above whose head, and occasionally simulating whose very attitude, it is sculptured, with a strong resemblance to the Persian ferocher, fairy, or Peri, which Maurice (and he is not very far wrong, except in mere expression) calls "the Image of the Soul." In the Irish wheeled cross, however, what is believed to be the Saviour takes the place of the king's angel in the centre, though not as in crucifixion. On one of the round towers of Ireland, that of Antrim, if we remember rightly, there is over a doorway a wheeled cross; and on another, in a like position, there is a figure not unlike that of an Irishman in a state of saltatory excitement.

This brings us to what Mr. O'Neill says of the round towers. These towers, he is of opinion, are Phallic; but in this he is not very original. This, it may be recollected, was poor O'Brien's theory; and indeed, if we mistake not, this was Higgins's theory also. Mr. O'Neill, however, does not even broach this theory in the present volume, but speaks of another in which he means to do so. The Phallic symbol was doubtless a very widely extended one; but till the true religious meaning of this symbol be expiscated, no very accurate theory can be worked out, we should think, as to its connexion with the round towers of Ireland. That its real and ultimate meaning was something far beyond the grosser and more obvious one which it suggests can, we think, be clearly shown; so that the *phallus* was at best merely the symbol of a symbol; but this we need not here enlarge upon any further.

Mr. O'Neill says, "We have heard that there are buildings in France which resemble the Irish round towers." Here he indicates that he has just missed by a hair's breadth materials for at least as feasible an idea as the Phallic one; and we would take leave to suggest that he ought to look a little farther into the subject of those buildings in France to which he alludes, before he publishes his volume on the "Phallic mysteries." The buildings to which he refers can be no other than those called by De Caumont, the "lantern of the dead," or the "beacon of a cemetery." That the Irish towers served some such purpose in connexion with those very strange, but still we think traditionally emblematic and explicable observances called "Irish wakes," and "*waking* the dead," we think every one who reads the paper we published recently,* in regard to "The round towers of Ireland," must admit. It is a curious circumstance that in Scotland there are churches which still go by the name of "the Stanes," or "the Stones," a name whereby churchyards were known in Pagan times. The "Stones" were of course allusive to those universal memorials of the dead, the tombstones, which are by no means of Christian origin, or of mere Christian antiquity. In connexion with this circumstance it is also a significant fact, that the Irish towers are in some districts called "clocthеachs," which, Mr. O'Neill tells us, mean the *stone* houses, or the stone buildings; a name which may have been more especially meant in ancient times to indicate the house or building at "the Stones," as in Scotland,—whose intimate connexion with Ireland,—the actual Scotland of extreme antiquity—is well known; as is the fact that there are round towers of the Irish order in Scotland itself. There are such towers in India, which Lord Valentia was told were of an extreme antiquity, and belonged to a people whose religion was as mysterious as those ancient towers; and if so, doubtless, they, too, were "lanterns of the dead," and connected with the religion of "the terrible Nirritti," the goddess of death and destruction, which the conquering "white-visaged friends of Indra," the Aryan forefathers of the Brahminical race, found already prevalent among the aborigines of India; and which, as we have before suggested in the *Builder*, probably constituted the primitive form of Buddhism itself, afterwards revived by Sakya, the son of a Brahmin, and again suppressed. Lucian, the Pagan writer, also describes such towers as the Irish, as existent in Syria before the temples of his time. In connexion with these allusions to round towers in Syria and India, and the supposed use of the Irish towers as "lanterns of the dead" in Irish "night wakes," we may mention that in the eighteenth volume of the *Asiatic Journal, of Bengal*, we have seen, in an account of the Bodos and the Dhimals, who are sub-Himalayan tribes, that waking the dead, just as the Irish do, with drinking and feasting, is a prevalent practice; and that they also go to the graves of the dead, and there leave food and drink. Other practices of these tribes are curiously suggestive of Scottish and probably also of Irish customs; such as youths, towards the end of the year, going about after nightfall dancing and singing, and asking largesse, dressing themselves as females, &c.; which, in Scotland, is called "guising," or disguising, and partakes much of mummer and carnival customs.

Another small item of contribution towards shedding a little more "lantern" light, or "dead" light, on this mysterious subject, and we have done. At a provincial council of bishops at Elberis, in Spain, the precise date of which we do not recollect, but which took place some time before the six-hundredth year of the Christian era, this council "forbade tapers to be lighted in cemeteries *in the day-time*, that the spirits of the saints might not be disturbed,"—a fact which, however obscure in its inferential meaning, at least seems to imply that tapers or "lanterns of the dead" *by night*, were in use very early in the Christian era, though this does not carry us quite back to pre-Christian times.

NOTTINGHAM ARCHITECTURAL ASSOCIATION.

THE ordinary meeting of this Association was held on the evening of Tuesday, February 3rd, 1863, in the committee-room of the Public Offices, St. Peter's Church Side; Mr. Hine in the chair.

The discussion on the question of the voluntary architectural examination, as contained in the paper of regulations and course arranged and prepared by the Royal Institute, was resumed; and after giving so important a subject that full consideration and discussion which it demanded, it was unanimously resolved,—

"That this Association, while fully appreciating the exertions of the Institute in the preparation of the valuable scheme of examination for the architectural profession, now submitted for their consideration, deems it due to the large body of architects of experience already in practice, and who cannot be expected to devote the time necessary to an examination, that they should receive from the Institute such a distinct recognition of proficiency by diploma or otherwise, as will place them in a position not inferior to those younger practitioners who may present themselves for the honours of the Institute."

A communication from Mr. Pritchett, the hon. secretary to the Alliance, respecting the objectionable conditions contained in the Plymouth Wesleyan Chapel competition, was discussed, and the members of this Association recommended that all designs be withheld until the conditions were made more satisfactory to the profession. After the nomination of gentlemen as associates, and the transaction of general business, the meeting adjourned to the 3rd of March.

A LECTURE ON ARCHITECTURE TO THE ROYAL ENGINEERS.*

Ornamented Construction.

THE elements of construction in Classic architecture are so simple, that they do not afford striking illustrations of the principles of ornamented construction. The base and capital of a column are of very little constructive value, but the one gives apparent stability to the shaft, the other seems to confer on it a power of supporting. an entablature, and both are appropriate for their purposes, as may easily be tested by reversing their positions. In like manner the division of the entablature into three parts—architrave, frieze, and cornice—does not add to their strength, but does to their appearance of stability, and the plain string lines of the architrave help this considerably. The frieze, as the neutral part in the centre, was generally the most ornamented; while the cornice, which was to crown all, and give shadow, was always the most broken,—first, because a plain shadow is always heavy, while a broken shadow is sparkling; and, secondly, because the cornice, having nothing to support, was the part of an order that might be most playfully treated.

In the classical orders every ornament is appropriate to the use of the part to which it is applied, and is elegant in itself; so that all the requisites of good architecture are satisfied, and the result has commanded the approval of all succeeding generations. If you analyze in the same way the ornaments of any Gothic building, you will see their architects followed out precisely the same system. Take, for instance, the vaulting shaft which appears to support the springing of the vault in all the stone-roofed churches: you know that it is of no more use than the torus of a Classic base, or the foliage of a Corinthian capital; but take it away, and it immediately appears as if the vault would slip down the wall. Sometimes it rests on a bold bracket, at others on the capital of the main pillars; and in later times was brought down to the floor; but it was always felt to be so beautiful and so essential an ornament that it very seldom was dispensed with. Originally, the great circular pillars that supported the main walls of the building were ornamented, as in Westminster Abbey, by four such shafts,—one pointing to the main vault of the nave, another to that of the aisles, and two more which appeared to carry the mouldings of the pier arch. These afterwards were multiplied to a very great extent, but never lost their apparent meaning, and thus retained the character-istic of good architectural ornament. In early times they always had capitals, and rightly so; because, in spite of the practice of later architects, the change from a straight line to a curved one ought always to be marked in good architecture, and can seldom be marked too strongly. Instead of doing this by mass, which is the most obvious mode, the Gothic architects accomplished it by sharply-marked and deeply-cut mouldings; and again, frequently made their shadows still more prominent and sparkling by partially filling the cavettos with foliage. If we turn to the vaulting of a Gothic cathedral, we again find it constructed on precisely the same principles. A rib, especially in the angle of an intersecting vault, is a purely mechanical necessity; but it may be built flush with the face of the vault, or may be concealed. The Gothic architects, on the contrary, took care to display it so as to give the appearance as well as the reality of strength. They then accentuated it by deep moulding and sharp angles, to give it an appearance of power far greater than if it had been either simply square or round: afterwards they were so pleased with the effect of these ribs that, in this country especially, they spread them over the vaults in the most complex and varied patterns: they tied them together at their intersections with bosses, and varied their dimensions with the relative quantity of work they were supposed to be performing. All this was perfectly intelligible; for, though no one supposes that all these ribs are really mechanically essential to construction, the mind never draws the line too closely between use and ornament. It is satisfied when the ornament is based on mechanical principles, and used where it may be or might have been, mechanically correct, or even where it suggests such a purpose. On the other hand we are always pleased with a great display of labour and ingenuity; and when elegance is added to this decoration, success is certain.

It would be easy, though I fear tedious, to go on analysing all the parts of Gothic ornamentation,—the windows with their mullions, the buttresses with their pinnacles, the towers and steeples all obey the same laws; all are based on mechanical exigencies; but these are made gradually to yield a part at least of their demands to ornamental arrangement; and frequently small details at last merge into mere ornaments; but in good architecture they are never employed, except where their protoplast would have been useful, or where they do not at least suggest that they may originally have done good constructive work. When this is the case, we have no right to inquire too minutely whether this is absolutely true or not. But if one ornament is used where under no circumstance it could have been useful, its employment is wrong; and if executed in any material which could not constructively be employed for that purpose, it is especially offensive. In a few words, the best architectural ornament is that which most clearly expresses the purpose and the construction of the building, or of that part of the building to which it is applied; and it approaches perfection in the ratio in which, besides its power of constructive expression, it is elegant in itself and pleasing to contemplate, irrespective of its architectural position.

The Gothic instances above quoted are, perhaps, the best examples of how little ornament is really required for architectural effect; and in many of the Mediæval buildings, those devoted to domestic uses especially, there is frequently only such an amount of ornament as would not increase the expense 1 or 2 per cent., while the result is most satisfactory.

The circumstances that generally lead modern architects into extravagance is that, instead of truth in construction and beauty of form, they attempt to disguise their buildings in either Classic or Mediæval costume; and the moment they attempt this they plunge into incongruities from which they can only extricate themselves by means of money and by hiding, by means of ornament, their want of thought, and thus hoping to distract attention from the falsehood they are perpetrating. There are so few truthful buildings in modern times, that it is difficult to get examples to illustrate these propositions; but two clubs in Pall-mall—the Reform and the Army and Navy—will suffice for present purposes. The former has no ornament but a cornice (which would have been better if it had been less expensive) slightly ornamented string courses marking the floors, and dressings to the windows: all this is perfectly legitimate and would have been ample had it been accompanied by a more ornamental arrangement of the building; but, unfortunately, its architect—though more free than most of his compeers from the vice of copying—was haunted by the idea of the Farnese Palace at Rome while trying to accommodate the wants of the Reformers in London, and he has, consequently, produced a building too gloomy for the climate, and especially for the northern aspect of its principal façade. Even a slight grouping of the windows would have done a great deal for it, as may be seen by observing how much that has improved the western front towards the Carlton. Or how beautiful the garden front of the Travellers' Club is, simply in consequence of the windows being grouped ornamentally, and this with the smallest amount of ornament has produced one of the most beautiful façades in London. The Army and Navy, on the contrary, is covered with most expensive ornament, a great deal of it good in itself, but utterly inappropriate to the place and the climate, and only tolerated because a palace in this style was erected in Italy in the sixteenth century; but there is no evidence of design in the building, no accentuation of the angles, nothing to tell of the internal arrangements. In fact, a most unsatisfactory result for an enormous outlay. But this is by no means the worst form of the borrowing system. Take, for instance, the London University. Here is a great portico, beautiful in itself, but at the top of a staircase no one goes up, and leading to a door that won't or can't open. But having put the portico there the whole building is sacrificed to it. The wings are plain and quiet enough, but it would have been an immense convenience to have had a third story. It would have given dignity to the building, and have afforded immensely increased accommodation at less expense than by any other means; but because there was a portico this became impossible; so that not only have we the direct expense of building the useless portico, but the indirect result of being debarred from using the most obvious means of obtaining the accommodation we require. In like manner, the portico of the British Museum may not have cost more than 50,000*l.*, but it has caused the waste of half a million; and half the funds of the Fitzwilliam trustees were wasted on a portico, the only use of which was to ruin the building for the purposes for which it was intended. It is this absurd system which has brought discredit on architecture; but if only a very small fraction of the money wasted on these very unsatisfactory buildings had been applied to express the meaning of any carefully thought-out and purpose-like design, to accentuate its construction, to enliven its façade, or to refine its more utilitarian parts, the result would have been widely different. But the melancholy truth is—it is so easy to borrow, it is so troublesome to think. When we have Gothic and Grecian details all ready to our hands, why must we set to work to invent new ones, and to think about every detail? While we have books which enable us to make up a design without thought or risk, why should we be forced to try and invent every detail, and to spend days and weeks in fitting every part to every other, with a painful suspicion that the result may be unsatisfactory after all? So architects have reasoned during the last three centuries, and the result is what we see, failure everywhere, and failure so complete as to prove beyond all power of contradiction that the moment an architect, no matter what his talents may be, once wanders from the path of simply *ornamenting ornamental construction*, and tries to reproduce the architecture of any other age or country,—once he deviates one inch from the path of truth and of common sense, combined with taste—he fails. He always has failed hitherto, and so far as can be seen, he always must fail in future.

Materials.

There is only one other point which I shall have time to dilate on now, and that is the influence which the materials employed ought to have in regulating the design. Taking bricks, stone, and granite, as the three degrees of comparison, it frequently occurs that an architect is, from the nature of the locality, restricted to one or the other; and when this is the case it is a fatal mistake not to accept the condition promptly, and to try to do the best he can with the material at his command. In doing this, however, it must be borne in mind that a design suitable for one class of material is, in fact, unsuitable for any other: with brick, for instance, it is almost impossible to obtain anything like grandeur, at least, if there are openings in it. A great solid bastion or tower of brick may be grand, because we lose the material in the mass; but the moment it is pierced or broken up, we see how small the material is, and that effect is lost. This is, however, no reason against its employment in architecture, it is only a reason for treating it in conformity with its nature; the consequence is, that a brick building can hardly be too much broken into small parts, or too carefully accentuated at the angles, or wherever strength is required, or too much fitted with discharging arches or other expedients to express strength of construction. Coloured bricks may also be used to accentuate arches and to mark string courses, and moulded bricks, or *terra cotta*, to ornament mouldings or cornices.

The first class—or accentuation by construction—was largely employed by the Romans, and the result is that some of their brick buildings look almost as monumental as if of granite. The last—by mouldings and colour—is largely employed in the north of Italy, and the result is the production of buildings as artistically architectural as any in stone, or even of marble, and quite as durable as either; but it must not be concealed that when so used it is very nearly, if not quite, as expensive as stone, and requires an amount of thought and skill on the part of those employing it which there is little hope of finding in the present day. Generally speaking, it may be asserted, that in almost any locality, in Great Britain at least, the moment you pass a very low quality of design, a better architectural effect may be obtained for the same expense by the employment of stone than by the use of brick. The stone itself gives a certain architectural character to the building, and very much less ornament will suffice with that material than with the other.

When brick must be employed, the first aim of the architect ought to be to *strengthen*,—to get rid, in fact, as far as he legitimately can, of the inherent defect of smallness, and consequent apparent weakness in the material he is employing. The employment of tiles in forming arches, as done by the Romans, is one of the most obvious expedients for this purpose, but vertical projections and reveals may also do much. Horizontal projections are not so easy with so small a material, but something may be done by a change in colour; and if moulded or ornamented bricks are not

See p. 101, *ante*.

available, or too expensive, a string course of darker colour will assist; but it must be confessed that a projection, however slight, will do more.

When stone is employed, especially if it is of light colour, all the required relief may be easily obtained by projections, and their consequent shadow and ornament can always be added to the extent to which the money at the disposal of the architect may justify. Granite is seldom used for domestic purposes; when employed in engineering it cannot be left too plain or too solid, its greatest merit is its mass and hardness, and these ought always to be left to tell their own tale; and when employed in smaller structures, still squareness and simplicity ought to characterise the outline of the mass and the design of the mouldings or ornaments; of these last, however, there can hardly be too little.

Of late years it has been the fashion to cry out against stucco, and to proclaim that it should never be used in external architecture. This, however, is hardly just; a stuccoed Grecian portico of colossal dimensions, or a stuccoed Gothic cathedral, or even parish church, a stuccoed palace, or college quadrangle, are abominations it is true; all these aspire to be monumental, durable buildings, in the erection of which expense is not a primary element, and the use of so perishable a material is a mistake and a sham; but stucco applied to the external walls of brick dwelling-houses is not only a reasonable means of keeping these walls dry, but adds to the lightness and cheerfulness of its aspect, and also allows of an amount of ornament being applied which would be unattainable in consequence of the expense under other circumstances. The only rule to govern its application is that it shall be avowedly stucco, and shall not attempt to look like granite or stone; nor shall pretend to monumental forms, or attempt to look as if designed to last for ever. With these restrictions its use is as legitimate as that of any other material, provided a more durable one cannot be attained, or the means are not otherwise available for obtaining a suitably decorative character.

There is a class of monuments, such as triumphal archways, columns, tombs, &c., to which I have not alluded in the above remarks, partly because they are not such as would interest you especially, and more because it would take long to explain their peculiarities. All of these which we use were invented by the Romans, who were very indifferent architects, though wonderful builders. They took a city gateway, for instance, and by the process described above first arranged its parts ornamentally and then ornamented it till, from an object of engineering, it became a work of architecture. So far they were right; but when they detached it from the wall and stuck it up where no one need, and few did go, through it, then it became an absurdity. So, too, with their columns. What Trajan wanted was a place on which he could engrave a record of his exploits, so he took a column, covered it with bas-reliefs, and placed it in the centre of a small court with galleries all round from which they could be easily seen; all this was tolerably reasonable. The absurdity arises when we attempt to copy without understanding, and stick up plain columns to no purpose except to place a statue where it cannot be seen, or archways which no one may go through. Even the Arc de l'Etoile at Paris, which is, perhaps, the best modern example of its class, would have been a far finer monument if it had contained a Hall of Victory in its centre instead of having an unmeaning arch through it. All this merely brings us back to the point from which we started. If you wish to do what is to be permanently good and satisfactory, first design your building wholly with reference to the purposes for which it is to be erected, or the uses to which it is to be applied; secondly, arrange the parts so obtained as ornamentally and symmetrically as the purposes of the building will admit of; and, thirdly, ornament the parts so arranged to such an extent as the nature of the building requires, or as the means at your disposal will admit of; and, lastly, let the ornaments be appropriate to the building and to the age in which it was erected.

If these rules are attended to, it will not be easy to go wrong, and good architecture may be attained at a very slight cost indeed.

In conclusion, let me try if I can, by repeating in as few words as possible what I have been saying, make myself more clearly understood.

The first thing I ventured to insist upon was, that there were two great classes of human arts—the *Phonetic*, or those concerned with the utterance or recording of speech, which is the exclusive privilege of mankind; and the *Technic*, or useful arts, which are not so exclusively man's property. But without insisting too much on this, the great point which we have to consider now is, that these two families, or groups of arts, are cultivated by totally different processes, and aim at totally different results. Both are capable of an æsthetic development—prose and narrative can be elaborated into eloquence or poetry, and every useful art into a fine art, without our ever being able to draw the line distinctly where the prosaic or useful ends, and the poetic or fine art begins. A still more important point is, that there is no affinity or connexion between these two groups as to their processes or principles; but, it is while thus repudiating her reputed sisters that architecture takes her true position as the queen of the useful arts. If not absolutely the most important of these, she can at least claim to be that one most capable of æsthetic expression, and the only one that has hitherto been refined into forms of permanent beauty, or has aimed at the attainment of grandeur or sublimity.

In all countries of the world, down nearly to the present day, and in Europe down to the sixteenth century, this art continued to be practised, and everywhere with success, on the same principles as in all ages governed, and do still govern, the development of all the sister useful or technic arts. At the Reformation, a new and extraneous principle of imitation was superadded, and for the last three centuries we have been labouring under the delusion that it was neither science that advanced the art, nor truth that rendered its production pleasing, but some strange notion that it would be beautiful if it could only be made to look like something it was not, or had only some very slender connexion with. What is now wanted to restore the art to its prestine pre-eminence is a return to those simple principles which guided the architects of Egypt, India, Greece, Rome, or the Middle Ages, and which are identical with those that now guide our shipbuilders, or machine or engine makers, or the engineers who construct our bridges or our forts. There is absolutely no mystery about it. All that is required is strict and undivided attention, first, to convenience, next to constructive necessaries, then to the ornamental or harmonious arrangement of the parts, and lastly, when it can be done, to their ornamentation.

It may require more thought and self-negation to succeed by this path in the present state of the art than by following the fashion of servile copying; but by the one path certain success may be easily and permanently obtained by even the most moderate abilities, while by the other path no genius will enable any man to erect a building which will be considered successful many years after its completion. This may appear a daring assertion, but it is justified by the experience of 4,000 years, during which the first path was followed by all the nations of the earth with uniform success, and by the experience of the last 400 years, during which the other process has been cultivated; and you yourselves can judge how far during it men have succeeded in attaining what they sought for. Taking into consideration the amount of money spent, the amount of talent employed, and the amount of knowledge available, the result has been the most complete and lamentable failure in the artistic history of the world.

JAS. FERGUSSON.

THE ARCHITECTURAL ASSOCIATION.

THE usual meeting of members was held on Friday evening, the 6th instant, at the House in Conduit-street.

The chair was occupied by the president, Mr. Blashill.

The following gentlemen were, on ballot, elected members of the Association:—Mr. James Lemon, 10, Outwell-terrace, Stockwell; Mr. E. Parker Dew, 8A, Whitehall-place; Mr. Charles A. Peters, 2, Princes-place, Commercial-road; and Mr. G. M. Whitaker, 57, Strand.

The honorary secretary read a letter from Mr. J. P. Pritchett, honorary secretary to the Architectural Alliance, stating that all the architectural bodies represented officially at the meeting held in July last, had given in their adhesion to the alliance on the basis of the rules then definitely agreed upon. The letter further stated that the next general meeting would be held in London, in July next, and that it would be desirable that the Association should appoint delegates to attend it. The delegates from the Northern Association would bring forward a draught scale of professional charges for discussion and adoption by the alliance; and would also propose the draught of a circular to be sent to the managers of all advertised competitions, pointing out what should be the course adopted by them in respect to the remuneration offered, and the mode of adjudicating the premiums.

Mr. Rickman then read a paper on the position of measuring-surveyors in reference to the position of the architects. The question principally discussed in the paper was whether measuring-surveyors ought to be excluded from the Royal Institute of British Architects, the author contending that there was room for both.

The President observed that no doubt the by-law of the Institute excluded surveyors from becoming fellows, although they might become associates; but that in any discussion of the matter, it would be very desirable to have the actual words of the by-law before them.

Mr. Paraire was disposed to think that the subject was one upon which the Association ought not to pass any opinion until in possession of the fullest possible information. For his own part, he did not agree with Mr. Rickman that the position of the surveyor was daily rising, although he was quite ready to admit that there were a great number of gentlemen in the profession of high and deserved standing. The great objection, however, which he entertained to admitting them to the Institute, was the necessity for drawing a line somewhere. If the surveyors were admitted because they were surveyors, how could the builder be excluded, who could allege with truth that he was a surveyor also?

The President said he apprehended that Mr. Rickman did not intend to refer to any surveyors but those who were employed by others.

Mr. Rickman said that was so. He never contemplated the admission of any surveyors but those who were understood to follow the profession of measuring surveyors only.

Mr. Paraire said he had always understood that the mission of an architect was to design, and the position of the surveyor to dissect the various trades, take out the quantities, and ascertain the expenditure under each description of work. He was, in fact, the builder's agent, although, of course, in the end, the client had to be the paymaster.

The President said, it was the duty of the proprietor to appoint a surveyor, and that in practice it was so, as the builder included in his charge the cost of taking out the quantities.

Mr. Mathews said he considered the by-law of the Institute very fair, as it did not exclude surveyors further than to make them ineligible to be Fellows. There was no objection to their becoming associates. It appeared to him that measuring surveyors had only sprung into existence of late years, as no trace of them was to be found in early times. The surveyor had by the very nature of his office to enter into such minute details that he could not be expected to be also a designer. There could be no doubt but that an architect ought to be a surveyor, but it did not at all follow that a measuring surveyor should be an architect.

Some discussion ensued in reference to the claim of builders' clerks to be considered surveyors; and Mr. Rickman stated that his experience led him to place great confidence in builders' clerks, as he generally found that they thoroughly understood their business. For his own part, he would much rather be brought into contact with an intelligent builder's clerk than with a "clerk of the works."

A vote of thanks was ultimately passed to Mr. Rickman for his paper.

The President announced that the next subject for the class of design would be a public fountain, and that on the next evening of meeting a paper "On Ventilation" would be read by Mr. G. B. New.

SOUTHERN OUTFALL WORKS.

MAIN DRAINAGE OF LONDON (SOUTH SIDE).

ON the 4th instant the corner stone of the engine-house of the southern outfall works of the main drainage of the metropolis was laid by the chief engineer of the Metropolitan Board of Works, assisted by nearly the whole body of members. The party assembled at the North Kent Terminus, London Bridge, at twelve o'clock, and proceeded to the Plumstead Station, where a special train, belonging to the contractor of the works, Mr. Wm. Webster, was in waiting to convey them across the Plumstead and Erith marshes to the site of the works at the river bank. The ride across the flat marshes was extremely pleasant and interesting; developing, as it does, the step by step taken by some previous generations to resist the stream and reclaim the foreshore of the river. We noticed three distinct embankments, similar in every re-

spect to the present river bank, that had been erected at early periods against the encroachment of the river, and to which we have before now referred. The alluvial deposit of these marshes produce abundant and highly-prized grazing land, and the Scotch and Irish cattle are brought over in thousands and turned out here to fatten.

Arriving at the works, the engineers, Mr. Bazalgette and Mr. Grant, escorted the party round the side of the reservoir, coal-sheds, culverts, boiler-house, &c., and explained the different uses intended for each. The reservoir, which is to be entirely covered with arching, but not groined, contains an area of upwards of six acres and a half, and appears to be a work of difficulty on account of the depth required to sink for a stable foundation for the piers to carry the arches. This place, when completed, will be an immense catacomb, rivalling in appearance those of Rome and Paris. Here was explained by Mr. Grant how the sewage of the whole of the south side of the river came down to this point, and was pumped up into the reservoir a height of 27 feet, and then at certain states of the tide allowed to flow into the river. Thence we descended into the foundations of the engine and boiler houses, where the corner stone was in suspension ready for final bedding. The engineer, Mr. Bazalgette, having ascended a raised platform, the ceremonial of laying the stone was commenced by one of the Board reading the parchment that had been prepared to be consigned to the vase: it contained the list of the Metropolitan Board, the names of the whole of the officers of the Board, and a general description of the works: this, with a copy of the *Times* newspaper, and the current coin of the realm, having been placed in the vase, it was laid in a cavity cut in the stone for that purpose; and the work of bedding having been performed by Mr. Bazalgette in approved Masonic style, he addressed the company, and said how delighted he felt in having now, after years of toil, arrived at a point from which the final completion of the drainage of London could be seen. This was the commencement of the end; and he trusted that when they met again it would be to open the works for the purpose intended. They were then standing under the bank of the river, and as much as 35 feet below the level of high-water. They might think that too much precaution and strength had been displayed in the timbering of this excavation; but when he stated that they had the whole weight of the embankment of the river to support, he was sure that they would readily admit the desirability of such strength. If any failure arose here, it would be worse than that of the King's Lynn catastrophe. And it reflected great credit upon the contractor, Mr. William Webster, and his agent, Mr. Matthew Jennings. The engine-house consisted in a building 154 feet by 53 feet. The engines and pumps were being constructed by the firm of James Watt & Co., Birmingham, and the contract sum was 45,000*l*. The boiler-house was 112 feet by 59 feet, and was to contain 12 boilers, each 30 feet in length, and 6 feet in diameter. These works, with the reservoir, culverts, &c., would consume over forty millions of bricks, and the contract sum was 300,000*l*.

Mr. Webster having turned the carpenter's shop into a dining-room, the company, to the number of seventy, sat down to a champagne luncb. At the conclusion, the chairman of the Metropolitan Board of Works, Mr. Thwaites, after giving the usual loyal toasts, proposed the health of the engineer-in-chief, Mr. Bazalgette. The latter gentleman, in responding, paid high compliments to the engineer of the works, Mr. John Grant, and his assistant, Mr. Frank Houghton. The Chairman, after proposing several healths, and amongst them those of Mr. Grant, who responded in appropriate terms; and of Mr. Webster the contractor (who, we find, has just obtained another contract under the Board, that of the Low-Level Sewer from Deptford to Battersea, at 235,000*l*.), left the chair; and shortly after the company took their way back to London, apparently well satisfied with the works and things in general.

SELF-SUPPORTING COOKING DEPOTS.

An interesting and important paper was read on the 4th inst., at the Society of Arts, Adelphi, by Mr. A. Burrell, on the cooking depôts for the working classes recently established on the self-supporting principle at Glasgow and Manchester, with suggestions for introducing them into the metropolis.

The first of these establishments, for which the working classes are indebted to Mr. Thomas Corbett, of Glasgow, a merchant well known in the West of Scotland as a practical friend to the working classes, was set agoing on 21st September, 1860, in the Sailors' Home, at Glasgow. The success which attended it led Mr. Corbett to open a second branch a few weeks later, then another, and another—a new one every two months or so up to the present time; so that at this moment there are thirteen in full operation, capable of accommodating 3,000 persons at one time; employing a staff of 135 persons, consisting of one manager, one cashier, one inspector, three vanmen, and one kitchen-man, in all seven males, with 128 females, including thirteen matrons, one at each establishment, and 115 waitresses, paying an aggregate rent of 1,140*l*. per annum, disposing of penny rations of all kinds to the enormous extent of 18,000 a day, involving a gross income of 10,000*l*. a year, and, finally, frequented by no less than 8,500 persons on the average every working-day of the week. These establishments have been spread through the districts chiefly frequented by working men, two of them in premises formerly occupied as large whisky-shops.

In all of them the best materials for food and unintoxicating refreshments, such as tea and coffee, are alone used; and each ration never exceeds one penny. The actual average cost is said to be about three farthings; and the odd farthing pays all expenses and leaves a surplus.

The branches have now become so numerous as to make it absolutely necessary that a large central store and model kitchen should be erected; and arrangements are in progress for supplying this want. At the foot of Pitt-street a store and kitchen are being built, the latter of which will, Mr. Burrell says, be the largest in the kingdom. It will cover 1,000 square yards of ground, and will be 20 feet high in the interior; and it is to be fitted up with steam-cooking boilers, ten of which are in course of manufacture.

Should such commendable establishments be formed in London, it would much enliven and attract were some simple music to be played at intervals (even a good pianoforte would suffice), especially during the evenings. By means of half a dozen musicians, and good and cheap refreshments, a somewhat similar establishment, though for a higher class, was some years since set agoing in Hungerford Hall, where hundreds of young men, such as clerks, shopkeepers, and many of a much higher rank in society, soon learned to spend a temperate and pleasant evening over their tea and coffee, chocolate, ices, newspapers, quiet games of chess and drafts, &c. This establishment has since been removed to the Adelaide Gallery; and although the Middlesex magistrates have thought proper to discourage such a rival to the ginshops and beerhouses, by refusing, without any sound or sufficient reason, the music license which they had before readily granted to the Adelaide Gallery when it was a drinking-hall with naked women exhibiting in it, the present establishment is still attended of an evening by crowds of respectable people, who seem to prefer it even still to such places as the concert-rooms attached to ginshops. This well-conducted establishment, which belongs to two enterprising and sensible Italians, Messrs. Gatti & Monaco, thus demonstrates that orderly places of temperate resort, where good and cheap refreshments can be had, are formidable rivals to drinking saloons and gin-palace concert-rooms, especially when first rendered additionally attractive by a little instrumental music; and we have no doubt that the same result would soon follow with a working-class refreshment-hall got up on similar principles.

FALL OF TILE ROOF.

On Tuesday evening, Dr. Lankester, the coroner for Central Middlesex, resumed an adjourned investigation into the circumstances which led to the death of John Parker, a labourer, who was killed by the falling of an arch into a new ice-well in course of erection for Mr. Gatti,* in New Wharf-road, Caledonian-road.

The coroner opened the proceedings by reading over the evidence adduced at the first sitting, which proved to be of a conflicting nature; but the effect of it was that Mr. Gatti employed some practical men to build an ice-well, and the roof, on the eve of completion, suddenly fell, with the deceased and two other workmen who were upon it at the time, into the well, a distance of 35 feet.

Mr. Robert Kerr, professor of architecture at King's College, said that he had examined the ice-well, and considered the cause of the accident unquestionably arose from the roof being built with four courses of tiles and cement, across 13 feet square, which would not carry their own weight. The thickness was only 3 inches, and how the men could imagine that such a roof would carry its weight, besides that of wind and snow, was beyond his comprehension. The work, so far as it went, was well done, but the accident was occasioned by an error of judgment.

Mr. William Mosseley, district surveyor under the Metropolitan Buildings Act, said he received notice of the intended erection in October last. He had from time to time visited the building, and he found no breach of the Metropolitan Building Act. He thought the accident was caused by the spreading of the arches.

The Coroner summed up at length, and the Jury returned a verdict of "Accidental death," with an addendum expressive of their conviction that the deceased lost his life from an error of judgment of those with whom he was not concerned, who performed the work of constructing the roof of the ice-well. The jurors further expressed their regret that Mr. Gatti, the proprietor of the ice-well, did not employ proper and sufficient superintendence over those who were engaged to perform the work; and they also regretted that Mr. William Mosseley, the district surveyor, should have allowed such a work to proceed to nearly its completion without detecting its dangerous nature.

* Not of the firm of Gatti & Monaco.

THE PAROCHIAL ASSESSMENT ACT.

At an aggregate meeting of delegates from the various Poor Law unions of the county of Worcester, at Worcester, to consider the expediency of adopting some uniform principle in arriving at the rateable value of property, Sir John Pakington presided, and the following resolutions were adopted:—1. That the gross estimated rental of lands and houses is to be taken at such an amount as may be reasonably expected by way of rack-rent from a yearly tenant, such tenant undertaking to pay the usual tenant's rates and taxes and tithe commutation rent-charges; and that therefore existing rents and property-tax returns ought to be considered only so far as they may be useful as guides for arriving at the full actual annual value. 2. That if, in consideration of the rent thus reserved, the landlord shall have agreed to pay the tenant's rates and taxes, or shall have let his land as tithe-free, although it is in fact subject to a tithe commutation rent-charge, and the owner of such rent-charge is separately rated for the same; the amount of such rents and taxes or tithe rent-charge ought to be deducted from the rent so reserved, in order to arrive at the gross estimated rental; but when the land in respect of which such rent has been reserved is actually tithe-free, or the tithe-owner is not separately rated, no similar or equivalent deduction ought to be made. 3. That the rateable value of lands and houses is to be ascertained by deducting from the gross estimated rental the probable annual average cost of repairs, insurance, and other expenses, if any, necessary to maintain them in a state to command such rent. For this object it is desirable that the said deductions be made with uniformity throughout the county, and the following scale is recommended to the committee. First, for lands without farm-buildings, 2½ per cent.; second, for lands with farm-buildings, 7½ per cent.; third, for houses and other buildings, except cottages and mills and manufactories, 15 per cent.; fourth, for cottages, 20 per cent. 4. That in the case of tithe rent-charge the gross estimated rental should be the amount of commutation for the last preceding year, and the rateable value should be ascertained by deducting from the gross rental and tenant's rates and taxes, including tenant's property-tax, and an allowance of 10 per cent. for costs of collecting and legal expenses, and losses by default of payment, and the amount of all tenths and all other ecclesiastical dues and payments, and of insurance and repairs of any chancel to which such rent-charges may be liable, and also all payments in respect of district churches and of assistant curates whose services are required in addition to, and not in substitution for, those of the incumbent. 5. That the assessment of mills, manufactories, railways, canals, collieries, brick-yards, and other property not particularly noticed in the foregoing resolution, must be left to the discretion and judgment of the several assessment committees.

THE PRINCE CONSORT MEMORIALS.

Guernsey.—The special committee for the Prince Consort Memorial assembled at the Government office, 7th of February, for the purpose of having an interview with Mr. Durham, the sculptor, who brought with him a model of the pedestal on which he purposes to place the statue. The committee undertake to see the pedestal executed, under the professional superintendence of Mr. Le Mesurier, C.E., according to plans to be settled by the sculptor, and the work to be of grey Guernsey granite. The statue itself is to be formed in copper, by Messrs. Elkington & Co.'s process. Mr. Durham agrees to land the statue in the island, and he undertakes the responsibility of

placing it on the pedestal, for the sum of 900 guineas, the committee providing the necessary gear and labour. It will be a repetition, as our readers know, of the one intended for the Memorial of the 1851 Exhibition, with permission of the Queen. Guernsey will thus have a remarkably fine statue at small cost.

Victoria Park.—A movement is on foot to erect a memorial bridge over the Regent's Canal, at Twigg Folly, near the southern entrance to Victoria Park, in lieu of the present narrow and dilapidated structure. The suggestion to call it "The Albert Memorial Bridge" has been well responded to. About 300*l.* have been collected, including a donation of 20*l.* from Miss Burdett Coutts.

Gravesend.—In commemoration of the Prince, it was determined to endow the St. Thomas's Almshouse. A fund has been raised for this purpose, but as it is a small one, it is greatly hoped that it may be increased. The trustees have caused two marble tablets to be placed on the building: one as follows is on the Windmill-street side:—"The endowment of this charity was commenced by public subscription A.D. 1862, in grateful remembrance of Albert Prince Consort, and is invested in the trustees with the hope of future contributions:" the other, in King-street, is as under:—"By the will of Henry Pinnock, dated 30th August, 1624, these houses were left for the better relief and maintenances of poor decayed persons living in the parishes of Gravesend and Milton."

Banbury.—The idea of the window to the memory of the Prince which was dedicated the other day in Christ Church, Banbury, originated with the wife of Mr. J. Fortescue, of that town, who collected 140*l.* for the purpose. The work, which is in five lights, is by Mr. Drury, and consists of figures of our Lord and the Evangelists. Under each of the latter are appropriate symbols, whilst at the foot of the centre light are the arms of the Prince quartering those of the Queen. The inscription "*In memoriam Alberti Principis Consortis Victoriæ, Britunniarum Reginæ, defuncti* 1861," runs along the bottom of the window.

Abingdon.—A project has been started to erect a statue to the memory of the late Prince Consort, either in the new recreation-ground or the Market-place at Abingdon.

Glasgow.—A meeting of the subscribers to the Prince Consort Memorial Fund was held on Tuesday in last week, in the council-chamber, the Lord Provost presiding, for the purpose of considering and approving a report by a sub-committee, as to the character of the memorial. The sub committee's report was to the effect that, at a meeting held on 5th December, it had been resolved by a large majority that the memorial should be of a statuary character, as opposed to a scheme which had been suggested of erecting some sort of public building dedicated to the memory of the Prince. Principal Barclay moved that this resolution of the sub-committee be approved of, and that it be remitted to the sub-committee to fix a site, employ an artist, and generally to carry out the objects of the subscribers. Mr. Robert Stewart seconded the motion. Sir James Anderson and Mr. D. C. Rait advocated the idea of a public building, but no counter proposition was made, and the motion was carried without a vote.

GAS.

The bad quality, high price, and deficient quantity of the gas supplied by the Maidenhead Gas Company having been much complained of, a meeting of gas consumers has been held on the subject. The meeting was addressed by Mr. T. Atkins, civil and gas engineer, who stated that he had had much experience in lighting upwards of fifty towns with gas, all from 1,000 to 15,000 inhabitants, and had endeavoured to make gas works not only paying undertakings, but the medium for promoting rational and civilizing influences, and for dispensing comfort. As for Maidenhead, he regretted to say there was a dereliction of duty and a short-sightedness on the part of the old company. He cited half a dozen towns of a like size to Maidenhead, where he had been called in to erect new gas works, all of which had ended in the price of gas being reduced, the consumption extended, and the dividends increased, in some cases from almost zero to 8, 9, and 10 per cent. The commercial policy to be pursued in gas works, he remarked, is to manufacture largely and easily, and supply extensively and at a cheap rate. The terms required by the consumers were a reduction from 6s. 6d. to 5s. per 1,000 cubic feet. In Chepstow, with a population of only 3,500 persons, he had put up new works, at a cost of 6,000*l.*, and had reduced the price of gas from 10s. to 4s. Though both the old and new company still carry on business, both pay a per centage, the new company paying 6 per cent. At Barnet, the rental had been increased from 200*l.* to 1,600*l.* per annum, the old company had been bought up for a large sum, and the price of gas had been reduced from 10s. to 5s. per 1,000 cubic feet. At High Wycombe, the price had been reduced from 15s. to 6s., and the old company's works purchased. In each of these cases a dividend of from 6 to 10 per cent. had been paid. At Dartmouth, with new works at 3,500*l.*, the gas was lowered to 5s., 1,200*l.* paid for the old works, and a similar dividend paid. All these were the results of cheap gas and free trade in gas fittings. Companies stood in their own light by maintaining high prices for gas, and a monopoly of fittings. The nucleus of a Maidenhead consumers' deputation was formed at the meeting.——The Worcester Gas Company have declared a dividend of 10 per cent. for the past half-year.——The Chester United Gaslight Company have also declared a dividend at the rate of 10 per cent.: they have reduced the price of their gas so far by granting 2½ per cent. discount on speedy payment.——A dividend of 8 per cent. has been declared by the Stoke, Fenton, and Longton Gas Company, whose directors congratulate them on the success of their operations, and state that an enlargement of their works has become necessary.——A dividend of 6 per cent. has been declared by the Collingham Gas Company, besides a reserve; and the directors state that the consumption of their gas has considerably increased.——The Crowle Gas and Coke Company have declared a dividend of 5 per cent., leaving a balance on hand.——The Manchester Gas Committee have recommended the following reduced scale of charges in the townships beyond the city on the near side of the Mersey, viz.:—When the quarterly consumption is under 500,000 cubic feet, 4s. 3d. per 1,000; 500,000 and under 1,000,000, 4s. 2d.; 1,000,000 and under 1,500,000, 4s. 1d.; 1,500,000 and upwards, 4s. In the district beyond the Mersey, they recommended that the present price, 4s. 6d. per 1,000 cubic feet, should be continued. It was estimated that the reduction would at the present time amount to 800*l.* per annum. The report was adopted.——The Alnwick Gas Company have just declared a dividend of 10 per cent. for the past year, and resolved to reduce the price of gas 6d. per 1,000 cubic feet, making it 5s. per 1,000.

THE TENDERS FOR CARMARTHEN LUNATIC ASYLUM.

The following is a list of the tenders for Carmarthen Lunatic Asylum. Thirty-two firms sent in offers, ranging from 24,950*l.* up to 45,944*l.*, and this with quantities supplied! Mr. David Brandon is the architect. The quantities were supplied by Messrs. Williams & Schofield, and Messrs. J. C. & E. Lansdowne:—

	£	s.	d.
Somers	45,944	0	0
Thomas	39,650	0	0
Foster	36,848	9	0
Douglas & Co.	35,221	13	7
Williams	34,393	0	0
Moore	34,111	0	0
James & Price	34,100	0	0
Jones & Johns	33,650	0	0
Tregrena	33,000	0	0
Simms	32,636	0	0
Simpson	32,159	0	0
Jenkins & Hallett	31,999	0	0
Myers & Sons	31,844	0	0
Griffith & Thomas	31,665	17	0
Watkins & Jenkins	31,570	0	0
Howell & Morgan	31,133	0	0
Hughes	31,000	0	0

Warburton	25,760	0	0
Pollard, Taunton (accepted)	24,950	0	0

The Northampton Surveyorship.—At last week's meeting of council, Mr. William Law was proposed as surveyor to the corporation. Mr. Vernon proposed that Mr. Hull be appointed in the room of his father. The two motions being put to the council, Mr. W. Law was elected by a majority of 11 to 5.

VENTILATION OF HOUSES.

The following notes were prepared by me previously to the discussion at the Institute on Monday last, on the subject of "Ventilation," intending to take part therein: as, however, the opportunity did not occur, and since the meeting has been adjourned, I beg to forward them to you to notice (if you should think them of sufficient interest), prior to the resumption of the discussion.

Attention to a few very simple rules would do much to achieve the result so devoutly to be wished, viz, the proper ventilation of our dwellings.

Every window should be proportioned to the size of the room; and, if possible, be opposite a second window; but the last is rarely attainable in ordinary dwelling-houses, and might not be desirable if it were, on other grounds. All windows should rise to within a foot of the ceiling, and be made to open at the top and at the bottom, so that by opening the doors and windows the room may be flushed with fresh air, and in a few minutes rendered perfectly sweet; and even if the doors are closed, the opening of both upper and lower sashes will produce an inward and an outward draught. But windows should not be alone depended upon, since they can only occasionally be employed, when the room is unoccupied.

External fresh air should be admitted by a tube to a chamber behind the stove, where it may be warmed before entering the room, to feed the fire and the occupants with fresh air, without drawing the atmosphere in draughts through the cracks of the doors and windows, the draughts from which are increased in proportion to the absence of other means of replacing the air exhausted in respiration and the combustion of fuel, &c. The outlet from this air-chamber may be through ornamental fretwork in the stove front. In winter, or at night, and especially if there are gaslights, it will be specially important to provide a ready means of releasing the impure air, without necessitating it being drawn down to the low level of the fire place, to escape by the chimney-shaft when the windows are closed. For this purpose the chimney flues should be constructed in duplicate; that is to say, each room should have two flues 9 inches square, each divided by a thin plate of iron only instead of the usual half-brick withe (similar to those invented by Mr. Boyd): one of these flues will be for the smoke, the other for vitiated air. The opening into the latter from the room should be of the same area as the flue itself, and be situated immediately below the cornice of the room next the ceiling, and provided with a means of opening and closing. (Dr. Arnott's valves are the best.) The cause of their smoking sometimes arises from the absence of a sufficient quantity of fresh air in the apartment, and also from the wideness of the chimney throat.) The heat of the adjoining flue would cause a sufficient rarefraction of the air to create an upward draught in the flue, and thus the vitiated air would be drawn off from the apartment. To prevent down-draught drawing smoke into the air-flue at the point of exit, the latter should open at the side of the chimney-stack, while the smoke-flue should pass up in the usual manner and escape at the top of the chimney-stack. (The writer has successfully introduced these arrangements in buildings erected by him; and, besides the fresh air supply to the stove, has also admitted it from the hall, through apertures contrived over the head, and under the discharging arch of the door.)

The kind of stoves employed may be those manufactured by Messrs. Boyd, Kennard, and others. And Mr. Billing's throttle valves to the terminals will be an advantageous addition, especially in windy weather.

Some cross ventilation by opposite windows should exist in every house, if not in the several rooms, at least in the stairs and landings with which the rooms communicate; so that by opening the room-doors a direct current of air may be maintained at pleasure between the windows in the rooms and the stairs. No house can be considered healthy where reservoirs of stagnant air are permitted to exist.

A false economy commonly incloses the upper stories of staircases between back and front drawing-rooms or closets, so that that portion which the heated and impure air naturally rises into every part for which no means of ventilation are provided; and should the necessity for lighting by a skylight, it is ten chances to one that no means of opening or closing, or aperture for ventilation, are provided. The trap-door to the roof if fitted with perforated zinc might be of some value, but is never so employed, and the roof has no current of air specially provided to assist the escape of such vapours.

Wherever gas is burning fresh and foul air-shafts are required, especially in shops, and not only for the sake of ventilation, but for the increase of light by the more abundant supply of oxygen to aid combustion;—in proportion to the purity of the atmosphere is the brilliancy of the light.

A simple window is insufficient to ventilate a water-closet or lavatory, &c.; and if no cross ventilation can be gained by opposite windows, draught may be secured by external ventilators in direct communication with the closet, or through tubes from perforated zinc-covered openings in ceiling. If this cannot be done, it is better to hang the casement on pivots in the centre than on hinges, the windows being placed as high as possible.

The soil-drains will also require to be ventilated by external shafts, or they will often ventilate themselves with the dwelling. Every other entrance to the drains to be water-trapped.

In larger rooms a greater amount of fresh air will be required than can be admitted through the chamber at the back of the fire; and the point chosen for the admission of the fresh air should always be situate opposite a foul-air shaft of equal area and near the ceiling, or the draught towards the fire will be objected to; and a due proportion should be observed between the admission and dismission of air and the size of the room to be dealt with. Thus, a foul air-shaft 9 inches by 9 inches will answer for a room containing 5,000 cubic feet. Where cold air is admitted at the ground it chills the feet, and makes the coldest part of the room cooler, and rarely rises higher than the fire.

It should be borne in mind that upon the height of the upshaft and the proper influx of fresh air will greatly depend the strength of the draught upward when the air in the shaft is at a low temperature; but if no fresh air is otherwise admitted, the foul-air exit shaft becomes a fresh-air admission flue in the absence of fires to warm the adjoining smoke-flues.

The less horizontal tubing for the conveyance of foul air the better, unless fresh air is admitted at one end and a heated flue receives it at the other. In that case the vitiated air is drawn along by the current as it enters by the perforations beneath the horizontal shaft; but to be of any use they must be very large if of much length. Mr. Kite's ventilators have been successfully used by the writer to produce an upward draught. Mr. Watson's ventilators answer best where no other means of admitting air has been provided. A stable at night when all doors are closed is usually well ventilated by one of these, or Mr. Muir's four-point ventilators. EDWD. C. ROBINS.

OUR THOROUGHFARES.

THE opening of the South-Eastern Railway terminus at Hungerford will have the effect of greatly increasing the amount of traffic in West Strand, and the want of some means of exit in a direction due north from this *locale* will be enormously increased.

Your voice is always foremost in pointing out these deficiencies in our means of intercommunication, and I remember that you long ago pointed out the urgent need of an improvement by widening and straightening the route from the Strand to Piccadilly by King William-street, Chandos-street, and Hemming's-row. This will be the natural course for all vehicles desiring to reach the West-end from the City, avoiding the concourse which the new station will occasion, and a great improvement would be effected by making two diagonal openings through the centre of Leicester-square. The four triangular portions might be planted and laid open in a similar manner to some of the *places* in Paris.

More than this, however, will be required. From the part of Oxford-street, between the Circus and Tottenham-court-road, there is no communication with Charing cross, except the narrow and tortuous defile of Wardour-street, Princes-street, and Dorset-place. A more direct and convenient route might be opened at a comparatively small cost.

An opening from Pall-mall East, close to the western end of the National Gallery, as before now urged in your pages, would take us into St. Martin's-street. The exit from this street into Leicester-square would require the removal of one house. At the north-western corner of Leicester-square is Leicester-street. There is only a small space required,—say two or four houses to be taken down,—to give access to the lower end of Dean-street (called, I think, Macclesfield-street); and by widening the outlet of Dean-street into Oxford-street, we should obtain a route tolerably straight and more direct than any existing thoroughfare in the same direction.

T. S. W.

THICK AND THIN JOINTS.

AT page 147 of M. Viollet le Duc's last published volume of the "Dictionnaire Raisonné" is the following passage:—"En principe, de moment qu'on ne peut poser les pierres absolument jointives, comme le faissaient les Grecs et même les Romains lorsqu'ils employaient le grand appareil, *mieux vaut un joint épais qu'un joint mince.*"

I should be pleased to see this remarkable dictum discussed by practical men in your pages.

I, in my limited experience, have been accustomed to hear admired the wonderfully *thin* joints of the ashlaring of many of our best Mediæval works; but here comes one of the great authorities, who insists on our admiring the *thick* joints of many Mediæval works. This thick and thin admiration puzzles the humble student, and it would be a blessing to us if some undoubted Don would tell us once for all whether we are to lay it on thick or thin. A STUDENT.

GOVERNMENT ENGINEERS, INDIA.

SIR,—With reference to a letter which I addressed to you about a month ago, pointing out the deceptive character of the Engineer appointments in the Public Works Department of India, annually thrown open to competition, I now beg to forward to you copies of letters which have appeared in the leading paper, *The Friend of India*, in corroboration of my statements. Whether you have published my former letter or not I do not know,* but I hope so, as it may perhaps save others from taking a step they will most assuredly repent bitterly when it is too late.

I can state from my own knowledge that nearly every one of my batch is anxiously looking out for an opportunity of leaving the department at any cost, so miserable are our prospects. There is no chance of getting any redress out here: our only hope lies in the powerful aid of the English press; and we look to you, as the leading professional paper, to show your usual alacrity in exposing abuses. A VICTIM.

Simla.

THE ARCHITECTURAL ASSOCIATION AND THE VOLUNTARY EXAMINATIONS OF THE INSTITUTE.

SIR,—The list of candidates successful in the class of proficiency at the first voluntary examination having been made public, allow me to draw the attention of your readers to the fact that seven of the eight students who passed being from London, five of those seven belong to the Architectural Association, and of the remaining two, one stands proposed for election.

This fact is very gratifying to those who take an interest in the Association. It shows that that body has among it a large proportion of those who thus stand accredited as the foremost architectural students of the day; and it shows, also, that the studies of our class of design and the proceedings at our ordinary meetings, have had their due result in helping to fit members thus to to take a position honourable alike to themselves and to the body with which they are connected.

I hope the result will be to attract to that body many of the architectural students who are preparing themselves for next year's examination. T. R. S.

PROCEEDINGS UNDER METROPOLIS BUILDING ACT.

AT the Wandsworth Police-court, on the 4th inst., Mr. J. McLachlan, builder, was summoned before Mr. Dayman for neglecting to give to Mr. Hiscocks, the district surveyor of Wandsworth and Tooting, notice in respect of certain works done by him at Mr. Barnet's, Wandsworth Common. The defendant pleaded guilty to not giving notice, but excused himself on the ground that he considered the building exempt from the operation of the Act, in consequence of its distance from any other building. The district surveyor said the building was not more than 15 feet distant from some other buildings in the same occupation.

Mr. Dayman was clearly of opinion that notice should have been given. Similar cases had been brought before him and thoroughly argued. The Act said the building to be exempt must be 30 feet from any building: if it meant those of an adjoining owner, it would have been from the buildings or ground, instead of "any other buildings and ground of any adjoining owner." When Messrs. Watney were summoned in a similar case, he had decided in the same way, and offered to give them a case for a superior court, but they refused, as they were quite satisfied as to their liability.

The district surveyor said he did not wish to press for penalty in this case; whereupon the magistrate ordered a nominal fine with costs, and notice to be sent.

* Vol. xx. p. 932.

Miscellanea.

ELECTRO-TELEGRAPHIC PROGRESS.—A new step in telegraphy is about to be made in the port of Liverpool. The lightships which lie off the harbour will be furnished with dials and wires to communicate with the shore.

MCINTOSH *v.* THE GREAT WESTERN RAILWAY. The statement contained in the paragraph respecting McIntosh *v.* The Great Western Railway, to which we gave insertion, has received the following explanation in the *Times*:—"It appears that the suit, McIntosh *v.* The Great Western Railway Company, alluded to yesterday, was originally instituted in Vice-Chancellor Stuart's Court, to establish a claim for 280,000*l.*, of which sum 80,000*l.* is certified by Mr. Peake, his chief clerk, to be due to the plaintiff, with interest, from about 1839. In connexion with this question, 76,000*l.* have been uniformly admitted in the company's accounts as a contingent liability, under the head of 'outstanding and unsettled claims.' The other suit, which is still pending, involves a further claim of 16,000*l.*" It is believed that the certified amount is still subject to rectification and possible reduction.

IRRIGATION AND CANAL WORKS IN INDIA.—A contract has just been executed by the Governor-General of India and the East India Irrigation and Canal Company for the construction of their scheme of works in Orissa, and the adjacent districts towards Calcutta. This is the first instance in which clauses of arbitration have formed part of the contract between the Government of India and a private company. The plans and estimates of a canal from the Hooghly to Balasore, 95 miles in length, are now complete, and its construction has been or is about to be immediately entered upon. The Government view this line from Calcutta to Balasore as one of great importance, and express a strong wish for its completion as quickly as possible, so that there is every probability of the work progressing very rapidly, especially as the introduction into Balasore of salt from Liverpool has broken up the manufacture of that article in the locality, and has materially increased the supply of labour for the company's operations.

ACCIDENTS.—At the Bishop's-road Bridge, Paddington, the flooring of one of the repositories of coal recently gave way, when the immense weight of coals (estimated at fifty tons) fell down on three men at work underneath, crushing them in a frightful manner. They were removed dead, and another man lies without the slightest hope of recovery.——The interior walls of a dilapidated house in High-street, Oxford, have fallen: it was about to be pulled down.——The wall of a newly-built cottage in Friar-street, Worcester, was observed to be cracked, and shortly after the building fell bodily. The foundations had been undermined by excavations connected with further building operations.——The Gloucester Steam Mills, at Gloucester, were recently burnt, and a gust of wind has suddenly thrown down one end of the main building, killing a woman and child. The coroner's jury censured those concerned for the dilatory and inefficient way in which the demolition was being carried on.——The roof of Nelson's Monument, on the Calton-hill at Edinburgh, lately took fire, it is believed from a stroke of lightning, but not much damage was done.

RAILWAY ACCIDENT.—A serious accident has happened on the Bow Extension of the Blackwall railway. This section of the line from the Stepney junction to where it joins the North London, is formed on brick arches some 25 feet above the ground. As a train of upturned trucks, in great confusion, were carried along on the occasion referred to, they came with a fearful crash against the coping or wall of the line, and carried away a large portion of the brickwork. Some of the trucks were toppled over and crushed and overhanging the parapet, and the line and road beneath were scattered with the contents of the waggons—cheese, flour, and other merchandise. The permanent way was torn up in sad havoc, and a heavy piece of brickwork at the Bow Commonbridge, where a line of rails runs in, was shivered by one of the trucks which had dashed against it. In another part of the coping a couple of truck wheels, with the axle entire, had been forced through the brickwork of the wall, and fell into the road beneath. The coping up to the Regent Canal-bridge appears to have been torn away by the waggons as they were hurled along, but the bridge does not seem to have sustained any damage. A large portion of the damaged brickwork will have to be entirely restored. No one was seriously hurt.

COMPETITION DESIGNS FOR FLORENCE CATHEDRAL.—Forty-five designs for completing the façade of the Duomo of Florence were sent in by forty-two competitors, and have been publicly exhibited. Three or four of the designs are understood to be by English architects.

THE VOLUNTARY ARCHITECTURAL EXAMINATIONS.—It is understood that the following gentlemen have passed in the class of proficiency:—Messrs. David Ebenezer Gostling, Robert Ovenden Harris, George Tunstal Redmayne, Lacy W. Ridge, Richard Phéné Spiers, Henry Stone, Thomas Henry Watson, Edward Wimbridge. It is stated that there were 19 candidates. No examination was held in the class of "Distinction."

BARBER SURGEONS' HALL.—Mr. Shoppee, architect of the Company, writes as follows:—With reference to the paragraph in your last number, I beg to inform you that in the conditions for letting the portion of the Company's Monkwell-street estate, care is taken that every object of architectural and antiquarian interest shall be preserved for re-using in the remaining portion of the buildings. The large hall is not required to be taken down, as without alteration to the fabric it is available for warehouse purposes. The court-room and other interesting portions of the present structure will not be interfered with by the proposed new buildings, but will remain for use as the Company's hall. The carved doorway to which you refer is intended to be refixed in the court-yard as the entrance to the hall.

INSTITUTION OF MECHANICAL ENGINEERS.—The sixteenth annual meeting of the members of this institution was held on the 26th ult., Mr. Charles F. Beyer, vice-president, in the chair. From the annual report of the council, it appeared that the institution was in a very prosperous condition; its number of members having during the year been considerably augmented. Mr. Robert Napier was elected president for the ensuing year. Two papers were read to the meeting, the first on a "Description of the Apparatus used for Sinking Piers for Iron Railway Bridges in India," by Mr. Joseph F. Strong, of Allahabad; and the other "On a Type-composing and Distributing Machine," by Mr. William H. Mitchell, of London. A number of members and their friends assembled in the evening and celebrated the anniversary by a dinner.

RAILWAY MATTERS.—The report of the Victoria Station directors states that the expenditure upon the station construction account since the last report amounts to 22,500*l.* There remain to be expended but 7,198*l.* to complete the 105,000*l.*, to which this company's outlay on the station is limited by the agreement with the London, Chatham, and Dover, and Great Western Companies. The traffic upon the line has increased beyond all expectation; and the difficulty experienced by the Brighton and Chatham and Dover Companies in meeting the requirements of the public has led to the deposit of plans and to the introduction of Bills by both of these companies in the present session, for the purpose of widening the line, and increasing the existing station accommodation.——The traffic receipts of railways in the United Kingdom amounted, for the week ending the 31st of January, on 10,588 miles, to 501,040*l.*, and for the corresponding week of last year, on 10,217 miles, to 471,230*l.*, showing an increase of 371 miles, and of 29,810*l.* in the receipts.——The Roman and Neapolitan Railway was expected to be opened for public traffic on the 15th of February.

ROMAN HOUSE ON SITE OF THE INDIA HOUSE. Recently at a meeting of the British Archæological Association Mr. T. Wright reported that he had visited the works of demolition on the site of the late East India House, where, in digging up the foundations, the workmen had come upon the floor and walls of a Roman house, the floor lying at a depth of nearly 20 feet below the level of the modern street. An outside wall ran nearly under the edge of the present street and parallel with it, and a transverse wall ran from it at right angles in the opposite direction to the street; and this latter wall was traced to a distance of perhaps 20 feet, when it met with another wall parallel with the former. The length of the room has not been ascertained, but it was evidently much greater than its breadth. The floor was in perfect preservation, and was formed of tesseræ of about a quarter of an inch square, black, white, and red, but arranged in no very intelligible pattern. The walls, which were 2 feet thick, remained on one side to a height of between 3 and 4 feet, and the stucco and fresco painting on the inner surface were unbroken. It appeared to have been painted in panels, with a rather rude pattern.

NEWS FROM STOCKHOLM.—The first stone will soon be laid of the new English Episcopal Church in Stockholm. It is to be in the English Gothic style, 80 feet long and 40 feet broad. The outside will be of dressed sandstone, but the interior will be faced with Swedish marble.

PASTORAL STAFF OF THE BISHOP OF CENTRAL AFRICA.—The pastoral staff for the Bishop of Central Africa, Dr. Tozer, recently consecrated, has been made by Mr. Keith, from the design of Mr. R. J. Withers, and is an elegant production. The head is of ivory and silver (gilt), and the staff of ebony. Forty carbuncles and a diamond adorn it. The cost, irrespective of the diamond, which was a separate gift, was about 150*l.*

WANT OF DRAINAGE IN RUSHOLME, MANCHESTER.—A deputation recently presented a petition to the Rusholme Board of Health, complaining of the want of drainage. The board explained that the great difficulty was to adopt a plan that would not be unbearably expensive to the ratepayers. They had had plans and sections, and levellings taken, and they had sent deputations to London; and the only result they had arrived at was, that the drainage could be thoroughly effected, but not without great cost. They hoped that in a short time they would find an easy solution of their difficulty.

THE DESTRUCTION OF THE THEATRE ROYAL, GLASGOW.—The ruins of this building have been inspected by Messrs. Baird & Neilson, who report that a portion of the walls was in an insecure state, and would require to be taken down immediately. No fewer than 136 persons were employed in the theatre, all of whom have been thrown idle by the catastrophe; and many of them have lost dresses and musical instruments. Mr. Houghton, the manager, has made arrangements for the opening of the Prince's Theatre, which recently underwent a thorough repair.

STRIKE AT WINDSOR CASTLE.—The carpenters, seventy or eighty in number, employed by Messrs. Myers & Son, the contractors for building the temporary saloons at the west end of St. George's Chapel, for the reception and accommodation of his Royal Highness the Prince of Wales and the Princess Alexandra, and personages who will attend the marriage ceremony, struck on Monday last, on the ground that they had been paid at the rate of 4s. 2d. *per diem*, whereas the Windsor master-carpenters were paying their regular men more money. They have since resumed work, the contractors having agreed to the terms required, namely, 4s. 6d. per day of ten hours, instead of 4s. 2d., the sum they had been previously paid.

STATE OF SPIRE OF ST. LAWRENCE'S CHURCH, SOUTHAMPTON.—At a vestry meeting, the architect, Mr. Bedborough, explained that the rod had become bent by the wind, in consequence of the accidental fixture of the cock; and one of the stays had become loosened; but that the spire and all connected with it had been built in a workmanlike manner, and was perfectly safe. The removal of the cock and the straightening of the rod were requisite, the vane being left to indicate the direction of the wind. After some discussion, in course of which an opinion was generally expressed that the architect was not to blame, the vestry authorized the churchwardens to procure from Mr. Frith an estimate of the cost of performing the work required to be done.

THE INVENTORS' INSTITUTE.—The Patent Law committee of this institute have reported to the institute on the subject of the Patent Law. As to the duration of patent rights they say:—"We strongly recommend that the attention of the Legislature should be called to the comparatively short time for which patents for inventions are granted, and to the injustice thereby occasioned to inventors. A fourteen years' patent right is surely a somewhat niggardly encouragement to inventors; since, during so short a period, few inventors are enabled to obtain anything like fair remuneration for the labour and skill required for practically developing and perfecting new inventions. A large outlay of capital, moreover, is usually necessary to bring an invention into general public use; but such an outlay is seldom justifiable, seeing that at the expiration of so short a time any person can step in and reap the benefit of whatever demand the expenditure of capital may have created. Hence, the labours of the poorer class of inventors are often fruitless." The committee is of opinion that the term of patent right should not be less than twenty-one years. A meeting of this institute was held at their offices, in the Polytechnic, Regent-street, on the 9th instant, to consider the working of the laws relating to patents for inventions, and the measures to be taken in defending the rights of inventors.

PROFESSOR SMIRKE'S LECTURES AT THE ROYAL ACADEMY.—On the 6th inst., Professor Smirke delivered an interesting lecture on Arcades, the last of his course. We shall give it *in extenso* next week.

TRAMWAYS.—The Potteries Street Railway Company declared, last Monday, a dividend of 2½ per cent. per annum. During the year 152,290 persons had travelled in the cars.

THE HARTLEY COLLIERY ACCIDENT.—According to a letter from the secretary of the Hartley Colliery Relief Fund, 70,000*l.* subscribed for the Hartley sufferers are safely invested in available securities; 5,500*l.* are in the bank; and 5,500*l.* have been distributed. What is to be done with this very handsome fund? It is not to be devoted to Hartley Colliery accidents alone, is it?

OXFORD WORKHOUSE: CLERK OF WORKS.—Fifty-four applications were received for the office of clerk of works, besides fifteen too late. The list was ultimately reduced to three, and the building committee recommended one of these, Mr. Joshua Walker, who had been employed as clerk of the works at the Birmingham workhouse, to the vacant office. An amendment was made to the effect, that Mr. John Castle, the clerk of the works at the Oxford Corn Exchange, be appointed. Mr. Walker, however, was appointed by a majority of 11 to 5.

DOVER.—On Thursday evening last Earl Stanhope was to lay before the Society of Antiquaries the correspondence which has taken place between the society and the Admiralty on the subject of the tides off the Straits of Dover, with a view to determine the place where Cæsar landed on our shores. The Admiralty have for some months been engaged, at the instance of the Society of Antiquaries, in taking observations on this matter, and their report will also be laid before the meeting.——A provincial paper mentions that what was once known as Shakspeare's Cliff, tunnelled some time ago, as all know, for a railway, has quietly glided into the sea.

TENDERS.

For taking down and rebuilding on an adjoining site the temporary church of St. George, Tufnell Park, Holloway. Mr. George Truefitt, architect:—

Longmire & Burge	£375	0	0
Allen	350	0	0
Waters	349	0	0
James & Ashton	334	0	0
Carter	297	10	0

For alterations and repairs to house, warehouse, &c., No. 52, St. Mary Axe, for Mr. Lazarus. Mr. J. Clarke, architect:—

Coleman	£420	0	0
King	386	0	0
Hardiman & Sandon	373	0	0
Wallis	303	18	0

For stoves, for the Stepney Union. Mr. Jarvis, architect:—

Boyd	£187	0	0
Caston	185	0	0
Wills	168	0	0
Hill	153	0	0
Deane & Co.	149	0	0
Fire Grate and Ventilation Co.	145	0	0
Hayward, Brothers	140	0	0
Evans & Co.	125	0	0

For house and lodge, to be erected upon the Hartnell Estate, Burlaston, Staffordshire. Mr. J. Stevens, architect. Quantities supplied by the architect:—

	House.	Lodge.
Lovatt	£4,000	£200
Collin & Hudson	3,998	254
Espley	3,793	312
Robinson	3,600	300
Young	3,595	280
Bullock & Barton	3,536	254
Terrar	3,435	328
Mathews	3,520	271
Harley & Dean	3,500	270
Ratcliffe & Son (accepted)	3,395	269

The above tenders are exclusive of a great portion of the materials.

TO CORRESPONDENTS.

Cast iron Columns.—A correspondent writes,—I should feel obliged if any of your correspondents would inform me of the formula for calculating the dimensions of hollow cast iron columns, above the table given in the "Engineer's Almanac," which takes only to 100 tons,—18 inches diameter,—½-inch metal. I cannot find it explained in "Tredgold."

J. W.—R. B.—A Workman (shall be thought of).—An Irish Architect.—Shamrock.—Competitor.—W. A. D.—R. D.—A F. (shall appear).—H. de M.—Messrs. O'C. (always glad to receive correct information).—P. C.—H. H. (a simple valve where the pipe enters the chimney would prevent return of the smoke).—A. B. C. (we have not much confidence in *per tar* as a preservative of wood).—R. A.—F. J.—A. L.—Messrs. L.—E. W. (send sketch and we will reply).—J. D. (ditto).—E. H.—L. & S.—J. P. S.—B.—Rev. A. B (see letter in present number).—H. H. C.—E. T. B.—J. S.—J. J. (shall appear).—A J. H.—F. T. D.

We are compelled to decline pointing out books, and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender; not necessarily for publication.

NOTE.—*The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.*

THE *Standard*, Nov. 15, speaking of Benson's watches in the Exhibition, says:—"It has evidently been Mr. Benson's object to render them rivals in point of beauty of decoration to the elegant Swiss knicknacks, and at the same time to preserve the characteristics of an English watch—strength, durability, and accuracy. In point of decoration his watches are certainly unsurpassed." Chronometer, duplex, lever, horizontal, repeaters, centre seconds, keyless, split seconds, and every description of watch, adapted to all climates. Benson's Illustrated Pamphlet on Watches (free by post for two stamps) contains a short history of watchmaking, with descriptions and prices. It acts as a guide in the purchase of a watch, and enables those who live in Scotland, Ireland, Wales, the colonies, India, or any part of the world, to select a watch, and have it sent free and safe by post.—J. W. BENSON, Prize Medallist, 33 and 34, Ludgate-hill, London. Established 1749. [Advt.]

ALLEGED SECOND-HAND SAFES.—Any person or persons having recently purchased, from furniture brokers or dealers in second-hand fire-proof safes, any such safes which were stated to be of Chubb's make, will oblige by communicating with Messrs. Robinson & Hine Haycock, No. 32, Charterhouse-square, solicitors to Messrs. Chubb & Son.—[Advt.]

ADVERTISEMENTS.

BUILDERS wishing to TENDER for ALTERATIONS to No. 2, Otway terrace, Norwood, for Mr. Ansell, can see the drawings and specification at Mr Campbell's Office, No. 3, Bartholomew-lane, by the Bank of England. Tenders up to 28th inst. Mr. Ansell does not bind himself to accept the lowest or any Tender.

THE GUARDIANS of the POOR of the BIRKENHEAD UNION, in the county of Chester, are prepared to receive TENDERS from competent persons desirous of contracting for the ENGINEERING and PLUMBING WORK to be executed at the new Workhouse, situate at Higher Tranmere. A separate and distinct Tender will be required for the Gas Piping and Fittings. The Works to be executed according to plans and specifications which may be seen at the Office of Mr. THOMAS LAYLAND, Architect, 20, Castle street, Liverpool. Sealed Tenders to be delivered or sent to me at my Office, 109, Lord-street, Birkenhead, on or before SATURDAY, the 28th day of FEBRUARY, and endorsed "Tender for fittings." Security will be required for the due performance of the several contracts. The Guardians do not bind themselves to accept the lowest or any Tender.
PETER GREGORY, Clerk to the Guardians of the Birkenhead Union.
60, Lord-street, Birkenhead, February 3rd, 1863.

SURREY COUNTY HOSPITAL, proposed to be erected at Guildford.—NOTICE to BUILDERS. Builders desiring to TENDER for the several WORKS required to be done in Building this Hospital, and the Outbuildings, Walls, &c. connected therewith, are requested to signify the same in writing, not later than the 27th day of FEBRUARY instant, addressed to Mr. E. W. LOWER, the Architect, at 126, High-street, Guildford, where each party must pay the sum of 10s. 6d. (to be added to the Funds of the Hospital), and may, on and after the 18th day of FEBRUARY instant, obtain information as to the conditions of the contract and form of Tender. All such persons as shall have made the above statement and payment will be required to meet—by themselves or by their agents, not being surveyors—the Hon. Secretary and Hon. Treasurer of the Hospital, and the Architect, at the Council Chamber at Guildford, on the 3rd day of MARCH next, at TWO o'clock, p.m. to appoint a Surveyor on their behalf, to take out the quantities conjointly with the Surveyor to be appointed by the Architect. Sealed Tenders endorsed, "Tender for Hospital," and addressed to the Architect, are to be delivered at his Office not later than TEN o'clock a.m. on the 31st day of MARCH next.
N.B.—The Building Committee reserve to themselves the absolute right to reject the lowest or any of the Tenders. Security from two responsible persons, to be approved by the Building Committee, will be required for the due performance of any contract entered into; and the person whose Tender may be accepted, will be required to pay one-half of the expenses of the stamp duty on the contract and bond.
C. B. DALLAS (Clerk), Hon. Sec.
Uplands, Guildford, 11th February, 1863.

TO CONTRACTORS and Others.—The LOCAL BOARD of HEALTH for the District of Sherborne, in the County of Dorset, are desirous of receiving TENDERS for the execution of the necessary Works in and for the EXCAVATIONS for, and the LAYING and JOINTING of about 1,100 yards lineal of 6 inch Cast-Iron Water Pipes, according to Specifications, which may be seen at the Offices of the Board's Engineer, as under, where also every information can be obtained. Tenders to be sent in on or before TUESDAY, the 24th inst. The Board do not pledge themselves to accept the lowest or any Tender.—By order,
C. S. NEWMAN, C.E.
The Green, Sherborne, Dorset, 9th February, 1863.

TO IRON FOUNDERS.—The Local Board of Health for the District of Sherborne, in the County of Dorset, are desirous of receiving TENDERS for the SUPPLY of about 1,100 YARDS LINEAL of CAST-IRON SOCKET PIPES, of an internal diameter of 6 inches, for the purposes of water supply, according to Specifications which may be seen at the Offices of the Board's Engineer, as under; where also every information may be obtained. Tenders to be sent in on or before TUESDAY, the 24th inst. The Board do not bind themselves to accept the lowest or any Tender.—By order,
C. S. NEWMAN, C.E.
The Green, Sherborne, Dorset, 9th February, 1863.

MR. WILLIAM ELLISON,
ARCHITECT and CONSULTING SURVEYOR,
OFFICES:—
13, FENCHURCH-BUILDINGS, FENCHURCH-STREET, E.C.

MR. J. H. LEONARD,
ARCHITECTURAL DRAUGHTSMAN,
ARTISTIC COLOURIST and LITHOGRAPHER,
No. 21, MONTAGUE-STREET, RUSSELL-SQUARE, W.C.
Competition and every description of Architecture, Working, and Detail Drawings prepared.

TO SURVEYORS AND BUILDERS.
A QUANTITY and ESTIMATING CLERK who is also a good Draughtsman, is open to an ENGAGEMENT, on moderate terms. Good references.—Address, R. A. L. Office of "The Builder."

TO ARCHITECTS, SURVEYORS, AND BUILDERS.
A QUANTITY SURVEYOR, MEASURER, and ESTIMATOR, of twenty years' practical experience in the various works connected with buildings, would be glad to treat with architects surveyors or builders, for taking off quantities, measuring, estimating, pricing bills, quantities, making drawings, writing specifications, making surveys of dilapidations, &c. upon reasonable terms. Satisfactory references given.—Address, S.V.R. Office of "The Builder."

MR. GEORGE THORNE, Architects' and Builders' Transfer Agent, Partnership Negotiator, and Accountant, will be found a reliable medium for the Purchase or Disposal of Businesses. 18 Austin Friars, E.C.

RUGBY LOCAL BOARD of HEALTH.—To SURVEYORS and OTHERS.—The Board are in WANT of a PERSON to fill the office of SURVEYOR, INSPECTOR of NUISANCES, and SUPERINTENDENT of the CEMETERY for the District of Rugby, at a salary of 100*l.* per annum. The person appointed will be required to devote his whole time to the duties of his office and to have a knowledge of Surveying, Road-making, and Engineering, and also to give security in 200*l.* Application with testimonials (carriage paid) must be forwarded to me addressed to the Chairman of the Local Board of Health, on or before FRIDAY, the 20th day of FEBRUARY instant.—By order of the Board,
THEODORE M. WRATISLAW, Clerk.
Rugby, February 5th, 1863.

THE COURT of ASSISTANTS of the WORSHIPFUL COMPANY of SALTERS, London, propose to APPOINT a SURVEYOR at their Meeting in the month of APRIL next. The nature of the duties and emoluments may be learned at the Office of the Clerk, at the Company's Hall in St. Swithin's lane. The Applications of Candidates (in Freeman's Livery) to be delivered at the Hall of the Company on or before SATURDAY, the 21st day of MARCH next.
EDW. THOMPSON, Clerk of the Salters' Company.
Salters' Hall, 10th February, 1863.

ARTERIAL and LAND DRAINAGE.—WANTED, a competent LEVELLER, and neat Measurer and Mapper of executed drainage.—Apply to Mr. THOMAS SCOTT, Land Agent, 13, Parliament-street.

WANTED, a YOUTH, in a Surveyor's Office. He will have the opportunity of learning drawing, &c. A small salary will be given.—Address, by post, in own handwriting, to H. G. 10, Old Jewry Chambers.

WANTED, for a Builder's Office, a Young MAN or YOUTH who is competent to prepare drawings under instruction, and for copying. No knowledge of building required. A moderate salary only will be given.—Apply by letter, stating requirements, &c. to J. M. 4, Hope Cottages, Wellington road, Stockwell, S.

TO BUILDERS' FOREMEN AND OTHERS.
WANTED, in a well-established Business, a PARTNER who can command 500*l.* or 600*l.* Joiner preferred.—Address, A. B. 56, Rhodalds-road, W.C.

TO SAW-MILL PROPRIETORS, BUILDERS, &c.
WANTED, in a few days, a SITUATION to SHARPEN and WORK at a CIRCULAR SAW BENCH. Has a good practical knowledge of a rise-and-fall table. Inor near few miles from London.—J. B. at E. Gardner's, 45, Paddington-street, Marylebone.

TO GILDERS.
WANTED, for a Permanency, a good WORKMAN. No person need apply unless he has a general knowledge of the business, and can furnish unexceptionable references as to character and ability.—Apply to SMITH, BROTHERS Northampton.

TO BUILDERS' CLERKS.
WANTED, a Youth as JUNIOR CLERK, who has had some experience in a builder's office, and who can trace drawings. The hours of attendance from six to six. Salary, one guinea per week.—Apply at 73, Upper Whitecross-street, St. Luke's.

WANTED, in Manchester, an expeditious and clever ARCHITECTURAL DRAUGHTSMAN, well acquainted with the several styles, and accustomed to perspective drawing.—Address, stating age, salary, and where last employed, to J. W. Wheeler's Library, Manchester.

BUILDER'S CLERK.
WANTED, an experienced CLERK in a Builder's Office. He must be a good estimator and surveyor, with a thorough knowledge of the prices of work in every branch of the trade, able to set out and superintend works, and make detail drawings. References required for character and ability.—Address, stating salary, to B. S. Post-office, Leicester.

DURABILITY of GUTTA PERCHA TUBING.—Many inquiries having been made as to the Durability of Gutta Percha Tubing, the Gutta Percha Company have the honour to call attention to a testimony from MR RAYMOND BARKER, Civil Engineer, Isle of Wight, Secretary to the Medical Society, who in reply to an offer received this day respecting the Gutta Percha Tubing for Pump Service, I can state with much satisfaction, it answers perfectly. Many builders and others passing have seen it, and there is not the least apparent difference since the first laying down, now several years, and I am informed that it is to be adopted generally in the houses that are being erected here."

N.B. From this it should it will be seen that the CORROSIVE WATER of the ISLE of WIGHT has no effect on Gutta Percha Tubing.

OFFICES—7, PALL MALL EAST, S.W.

This Company is established in order to meet the Building public investments of practical utility and economy, and to provide the capital necessary for the purchase and development of such only as are proved to be valuable.

The many advantages of the present method of applying plaster to the walls, partitions, and ceilings of buildings, have long been obvious to architects, builders, and the owners of home property. The public generally also is to a great extent aware which are the inconveniences and loss and repairs from the dirt, damp, and delays attendant on the present plastering process. The Company, therefore, propose to introduce a process (protected by the manufacture, or an extensive scale, of a substitute for wet and laster upon slate walls, ceilings, partitions, &c., called Dixon's Patent Dry Lamine, and the Directors have secured the patent for its manufacture. When it is considered the number of square yards which are contained in the walls, partitions, ceilings, &c. in a house of ordinance and upwards, constantly requiring to be treated in the manner, there can be no doubt as to the demand, and that large profits must accrue to the proprietors.

The fact that the Lamine has been used in many first class works for nearly two years—and it is there are orders low in hand for considerably larger quantities than the Patentee can supply—affords substantial proof of the estimation in which the Lamine is held by the purchasers. Some of the Directors, who have used the material from the first production, now testify to its many advantages; and in fact, it is considered, are the best guarantee to the Company that a speedy return may be confidently promised to the shareholders.

The estimated profit to the Members of the Company, after deducting all the expenses of management, will be 25 per cent. on the capital, which it is proposed in the first instance to call up.

The leading advantages offered by Dixon's Patent Lamine may be summed up as

The saving of time and labour.

Houses are more habitable, the Lamine being put up dry.

The saving of fuel in drying, plastering are avoided.

It is lighter and stronger than lath and plaster, and is not liable to fall, as under the old system.

The setting goes on pari passu the work, so that ceilings or partitions may be completed in one day, and rooms entirely finished, painted, and papered in two or three days.

The saving of 40 per yard, or nearly 20 per cent on the ordinary method of plastering.

The material being light and strong, can be advantageously supplied to any part of the world.

It is impervious to damp and non combustible.

It is put on or operated on, with the greatest ease, to the ceils and partitions of new work, or to old ceilings or partitions, in repairs or alterations.

It is clear that in future investments the Company will stand in the advantageous position of having effected the saving of effectually to test any patent that may be laid before the Directors, without incurring any new expense in that particular; that further, as when they shall have proved the value of any such saving invention, they will be enabled to lighten the expenses of management on the Loan account.

Prospectuses and further particulars may be obtained of the Secretary, at the Offices of the Company, 9, Pall Mall East, London, S.W.

ACCIDENTS By ROAD, RIVER, or RAILWAY; Accidents in the Field, the Streets, or at Home, May be PROVIDED AGAINST by taking a POLICY of the RAILWAY PASSENGERS' ASSURANCE COMPANY, 64, CORNHILL, LONDON.

INTERNATIONAL EXHIBITION, 1862.

CLASS 35, NO. 6849.

The only Medal "for Stone Ware" has been awarded to

DOULTON & WATTS, LAMBETH POTTERY,

LONDON.

In expectation of a greatly increased sale, D. & W. have determined to introduce the annexed pattern of their ENAMELLED STONEWARE CLOSET-PANS, at the price of the commonest description of earthenware.

Experience has shown that this shape is the most simple and efficient, and that in strength, durability, and cleanliness it cannot be surpassed by the most expensive closets.

FIGURE D STONEWARE CLOSET PAN AND TRAP, 3s. 9d. COMPLETE.

BARTLETT, BROTHERS, & CO.

DEVONSHIRE WHARF, CAMDEN TOWN, N.W.

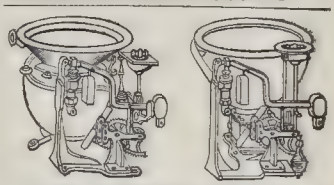
J. TYLOR & SONS' PATENT

REGULATOR WATER CLOSETS.



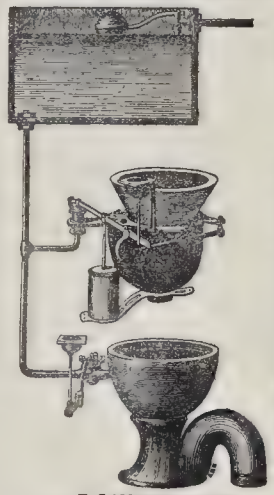
Valve. Pan.

The Regulator Valve gives perfect control over the supply of water to each closet, so that, however small the fall of water, perfect flushing is insured. Any number can be worked by one supply pipe. No cistern valves, cranks, or wires required. The Closets can be seen in action at the Manufactory, and Illustrated Catalogues sent on application to the Manufacturers, J. TYLOR & SONS, Warwick-lane, Newgate-street, London.

OSLEY POTTERY WORKS,

GLASGOW

Messrs. R. H. PENMAN & CO. from Staffordshire, Manufacturers of the best description of EARTHENWARE GOODS for Sanitary Purposes required in private and public buildings, supply the Trade, Wholesale, at the lowest possible prices for Cash. The Ware sent by their customers to the late Exhibition was highly spoken of.



GUEST & CHRIMES, FOUNDRY and

GENERAL BRASS WORKS, Rotherham; and 37, Southampton-street, Strand, W.C. London. London House,—Mr. THOMAS BEGGS. SEKHOLME'S PATENT PNEUMATIC REGULATOR and VALVE CLOSET. Suitable for first and second class Houses, being most efficient and simple, free from all smell, and requires no cisterns, service boxes, cranks, wires, or levers, but is complete in itself, ready for attachment to any ordinary house service pipes. It is supplied in three qualities, all equally efficient, differing only as to the style of fitting up. A second class quality is also manufactured. The Regulators are usefully applied to the ordinary Pan Closet, thus dispensing with all cisterns, service boxes, levers, cranks, wires, &c. The Regulator is supplied separately, as well as connected to ordinary direct Service Main Cottage Water Closets.

PAN CLOSET fitted with LAMBERT'S

VALVE, and UNDERHAY'S REGULATOR.

T. LAMBERT & SON,

FOUNDERS, HYDRAULIC AND GAS ENGINEERS, SHORT STREET, LAMBETH.

VENTILATION—PURE AIR.

Sheringham's Day and Night Ventilator

for the admission of Pure Air

THROUGH THE EXTERNAL WALL.

With single pulley, from 6s each; with leading pulley, from 6s. 6d.

These Ventilators are arranged so that the requisite quantity of Air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants, and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 187 and 189 (late 117 and 118), Union-street, Borough, London; and of all respectable Ironmongers, Builders, &c.

DRY RUBBISH.—WANTED, 200 barge-

loads of good dry RUBBISH; the same, if delivered alongside the Premises of the Thames Ironworks Company, Bow Creek, will be unloaded free of charge.

SALES BY AUCTION.

TO IRONMONGERS, BUILDERS, ENGINEERS, SHIP CHANDLERS, AND OTHERS.

MESSRS. FULLER & HORSEY are instructed to SELL by AUCTION, on MONDAY, FEBRUARY 16, at ELEVEN o'clock, on the PREMISES, Swan Lane, Upper Thames-street, in lots, without reserve, the Second and concluding Portion of the extensive STOCK-IN-TRADE of Messrs. Croley, Millington, & Co. removed from the works in Newcastle, in lasting masts; tons of cast, shear, and blister steel, hammers wrought hinges, grindstones, stone saws, cane chains, timber and trade chains, slops' ironmongery, locks, thimbles, &c.; export ironmongery, and a general assortment of black ironmongery; the warehouse fixtures, crane, cast-iron columns, day-light reflectors, Miners's safe, counting house and gas fittings, &c.—To be viewed on Saturday previous and morning of sale when catalogues may be had on the Premises, of Messrs. BROWN & DUBOIS, Accountants, 10 Basinghall-street; of Messrs. VANDER COM, CREE, & LAW, Solicitors, 73, Bush Lane, Cannon-street; and of Messrs. FULLER & HORSEY, 13, Billiter-street, E.C. Approved bills at three months' date will be taken from purchasers to the extent of 50l. and upwards. The Warehouse to be let, with immediate possession

TO ENGINEERS AND OTHERS.

MESSRS. FULLER & HORSEY are instructed to SELL by AUCTION, on WEDNESDAY, FEBRUARY 18th, at ELEVEN, at the WAREHOUSE, Belvidere Road, Lambeth, in lots, without reserve, the following MACHINERY, removed for convenience of sale, including an 8½-inch self acting screw cutting lathe, 11 feet gap bed; a 10 inch slide lathe (12 feet bed); bench drilling machine, a new tenoning machine by McDowall, a pair of 4 feet 6 inches granite edge-runners, a gun-lock letting-in machine by Evans & Son, two grooving machines for gun-barrels, an hydraulic guide pump, shafting, drilling machine, hand power fly wheel, an easy-action set of steel to tile, two large cramps, two dozen of assorted oak planks, two trolleys, work benches, valuable assortment of wood patterns, engine patterns, crane patterns (from 2 to 10 tons), several tons of coatings, office furniture, two spring town carts, spring truck, and numerous other effects.—To be viewed on Tuesday previous to the sale, when catalogues may be had on the Premises, and of Messrs. FULLER & HORSEY, 13, Billiter-street, E.C.

INTERNATIONAL EXHIBITION, 1862.—The Materials of the Annexes, the Shafting, Riggers, Columns, and Steam-pipes used for showing the Machinery in motion, and surplus Plant.

MESSRS. FULLER & HORSEY are instructed by Messrs. SHEFFIELD SCHOOL OF PRACTICAL SCIENCE and METALLURGY.

PRESIDENT.

His Grace the Duke of Devonshire, K.G. F.R.S. D.C.L. Chancellor of the University of Cambridge.

VICE-PRESIDENTS.

The Mayor of Sheffield, John Brown, esq.
The Master Cutler
The Right Hon. Lord Wharncliffe
Sir David Brewster, K.H. D.C.L. F.R.S.L. & E. M.R.I.A.
Sir Roderic Murchison, F.R.S. Director of the Royal School of Mines.
John Percy, esq. M.D. F.R.S. Professor of Metallurgy in the Royal School of Mines.
William Fairbairn, esq. C.E. F.R.S.
Robert Hunt, esq. F.R.S. F.S.S. Keeper of Mining Records.
Warrington W. Smyth, esq. M.A. F.R.S. Professor of Mining and Mineralogy in the Royal School of Mines

DIRECTOR.

The Rev. G. B. Atkinson, M.A. Principal of the Collegiate School; late Fellow and Assistant Tutor of Trinity Hall, Cambridge.

PROFESSORS.

Chemistry, Metallurgy, and Geology—James Allen, Ph.D. F.C.S. of the Universities of Giessen and Berlin.
Engineering and Mining—J. Thompson C.E.
Mathematics, Natural Philosophy, and Applied Mechanics—Rev. G. B. Atkinson, M.A.

The Sheffield School of Practical Science and Metallurgy will afford a complete scientific and practical education to students who are destined to become civil, mechanical, or mining engineers, or manufacturers of any kind. Its object is thoroughly to discipline the students in the principles of those sciences upon which the operations of the engineer, metallurgist, or manufacturer depend.

The education will be given by means of systematic Courses of Lectures, by Catechetical Class Instruction, by Practical Teaching in the Laboratory and Drawing-room, and occasionally by Field Excursions.

The School of Practical Science and Metallurgy will be conducted in the Buildings of the Sheffield Collegiate School. The two Institutions, although both under the superintendence of the Rev. G. B. Atkinson, Principal of the Collegiate School, are, however, entirely distinct.

A detailed Prospectus, containing Syllabuses of all the Courses of Lectures, and all other information, arrangements for boarding, &c. may be obtained by application to the Director.

THE SCHOOL OPENED THE FIRST WEEK IN FEBRUARY, 1863.

ARCHITECTURAL EXHIBITION, 9, CONDUIT-STREET, REGENT STREET. - Parties wishing to exhibit BUILDING MATERIALS or INVENTIONS at the forthcoming EXHIBITION; or desiring to send ADVERTISEMENTS for the CATALOGUE, must at once communicate with Mr. MOODY, at the Galleries. Drawings to be sent in on the 2nd of MARCH, between the hours of NINE and SIX.

JAMES FERGUSSON, F.R.A.S. } Hon. Secs.
JAMES EDMESTON, F.R.I.B.A. }

EXHIBITION at PAINTERS' HALL, London, 1863.—Notice is hereby given, that the THIRD ANNUAL EXHIBITION of GRAINING, MARBLING, WRITING, and DECORATION, will be held at the Hall of the Painters' Company, No. 9, Little Trinity-lane, Cannon-street West, E.C. in JUNE next. Notice of intention to exhibit should be given forthwith to the Clerk of the Company. Specimens for exhibition will be received from residents in the United Kingdom, between the 1st and 15th of MAY.—Full particulars of the terms of exhibiting to be had at the Hall, between the hours of ELEVEN and THREE daily.—By order of the Court,

F. G. TOMLINS, Acting Clerk.

GALLERIES of the ARCHITECTURAL UNION COMPANY (Limited), 9, Conduit-street, Regent-street, NOW OPEN, FREE, from ELEVEN till FOUR, daily. The Autumn Exhibition of Building Materials, Patents, and Inventions, will CLOSE, FEBRUARY 28, and must then be cleared for the Architectural Exhibition.

JAMES EDMESTON, Hon. Sec.

EXAMINATIONS in DRAWING, conducted by the SCIENCE and ART DEPARTMENT, will be held in the Metropolitan Schools of Art during the month of March, viz.:—

Finsbury, William-street, Wilmington square.
Hampstead, Dispensary Building.
Lambeth, St. Oswald's place, Upper Kennington lane.
Marylebone, Wells-street, Oxford-street.
Rotherhithe, Deptford-road.
St. George's-in-the-East, Cannon street road.
St. Thomas's Charterhouse, Goswell-street.
South Kensington, Cromwell road.
Spitalfields, Crispin street.
St. Martin's, Castle street, Long-acre.
Westminster, Vincent-square.

These Examinations will be open to both sexes of any age. Candidates for examination must send their names and addresses to the Secretary of the Science and Art Department, South Kensington, W. on or before the 7th MARCH, and at the same time state the subjects in which they desire to be examined, and at which of the above Schools they wish to present themselves. They will then be informed of the exact date and hour at which they can be examined. Schoolmasters are not only required to furnish the number of their students that will attend for any of these examinations.

By order of the Committee of Council on Education.

17th February, 1863.

SOCIETY of SCULPTORS of ENGLAND, for the Promotion of EXHIBITIONS of SCULPTURE.—SPECIAL NOTICE.—The days for receiving works in marble, stone, terra cotta, Wedgwood, Parian, bronze, and electro-type; wood and ivory carvings; gold and silver work in shields, vases, &c.; granite, marble, and Scagliola columns, will be the 12th and 13th of MARCH, instead of the 2nd and 3rd of MARCH, as previously advertised for the first annual Exhibition. The Council of the Society of Sculptors have arranged with the Committee of the Architectural Exhibition for this extension of time—Regulations for the Exhibition and Circulars of the Society will be forwarded on application at 9, Conduit-street, Regent-street, W. to

MORTON EDWARDS, Hon. Secretary.

TROUGHTON & SIMMS.—For SALE, THEODOLITES, LEVELS, CIRCUMFERENTERS, PENTAGRAPHS, EIDOGRAPHS, a Lead's Mining Dial, a colonial surveyor's Circumferentor with transit Telescope, Schmalcalder's Prismatic Compass, Protractors, &c., by the above-named eminent makers, at JOHN ARCHBUTT & SONS', 20, Westminster Bridge road, Lambeth, London, S.

BILLING'S PATENTS. CHIMNEY TERMINALS, THROAT VALVES

NOTICE TO ARCHITECTS. The Proprietors of the late Mr. Billing's Patents have secured the services of Mr. H. H. COLLINS, M.I.B.A. of No. 10, Poultry, E.C. as the Consulting Architect, from whom full particulars and the reduced prices may be obtained; or from the Manager, Mr. TYLER, 12, Abingdon-street, Westminster, S.W.

ARCHITECTS.—NOTICE is hereby given that the Trustees appointed by Sir John Soane, will meet at the MUSEUM, No. 13, Lincoln's Inn fields, on TUESDAY, the 24th of MARCH, at TWELVE o'clock at noon precisely, to distribute the Dividends which shall have accrued during the preceding year from the sum of £900 Reduced 3½ per Cent. Bank Annuities, invested by the late Sir John Soane, among Distressed Architects, and the Widows and Children of deceased Architects left in Destitute or Distressed Circumstances. Forms of Application may be had at the Museum, and must be filled up and delivered there on or before SATURDAY, the 14th of MARCH, after which day no application can be received.

COMPETITIONS.

TO ARCHITECTS.—GIRLS' SCHOOLS, MATRON'S HOUSE, and OTHER BUILDINGS. The Trustees of the General Charities in the city of Coventry, invite Architects to submit DESIGNS, with plans, specifications, and estimates, for the ERECTION (in pursuance of an order of the Court of Chancery) of a GIRLS' INDUSTRIAL SCHOOL, with Matron's House and other necessary buildings in the City of Coventry. The school room should be capable of holding seventy pupils, and there must be accommodation for thirty girls to be boarded and lodged in the house, and the buildings should be arranged so that they could be extended if necessary. The cost of the whole, including all extras, not to exceed £2,000. A ground plan of the site may be seen at my Office, and a lithographed copy will be forwarded on application. A premium of £20 will be paid for the design, plans, &c which shall be selected and adopted by the Trustees (and which can be carried out for the sum above limited); and a second premium of £10, will be paid for the designs and plans which the Trustees shall think entitled thereto. On payment of the premiums the Trustees are to be entitled to the designs, plans, and specifications selected, but are not to be considered as bound to employ the parties furnishing them; but in the event of the successful competitor being employed the premium will merge in the commission. The designs, plans, &c. to be forwarded to me under a letter or motto, with a sealed letter to correspond, on or before SATURDAY, the 21st day of MARCH next; and in the meantime any further information may be obtained on application to me

HENRY J. DAVIS, Clerk to the Trustees.

Hayclose, Coventry, February 5, 1863.

NOTICE to ENGINEERS, CONTRACTORS, and OTHERS.—The Town Council of Kingston-upon-Hull offer PREMIUMS of £50 for the Best, and £25 for the Second Best, approved Plan, Specification, and Estimate for a New Bridge crossing the River Hull, in the place of the present old North-bridge. The Plans, &c. to be sent in to the Town clerk's office, on or before the 4th APRIL, 1863.—Further information may be obtained on application to Mr. THORP, Corporation Surveyor, Hull.

By order, ROBERT WELLS, Town Clerk.

Hull, February, 1863.

PLYMOUTH WESLEYAN CHAPEL and the ARCHITECTURAL ALLIANCE.—The Managers of this Competition having refused to amend the conditions (see letter in "The Builder"), all Members of the Allied Societies are requested to decline the invitation.

TO ARCHITECTS.—The Town Council of Gateshead invite DESIGNS for the PROPOSED NEW TOWN HALL and CORPORATE BUILDINGS. A premium of 100l. will be paid to the author of the designs to which the Town Council shall award the first place, and a premium of 50l. to the author of the designs to which they shall award the second place. The designs are to be delivered, free of cost, at the Office of the Town Clerk, on or before the 1st of MAY next; and the two designs to which premiums shall be awarded will become the absolute property of the Town Council, without any condition whatever. A copy of the conditions to be observed by architects sending in designs, and a lithographic copy of the plans and sections of the ground will be supplied to competitors on application to the undersigned, and on payment of a charge of 5s.—By order,

J. W. SWINBURNE, Town Clerk.

Town Hall, February 13, 1863.

TO ARCHITECTS. FREEMASONS' HALL, LONDON.—The Committee entrusted by the Grand Lodge with this subject invite PLANS and DESIGNS for the NEW BUILDINGS, and hereby offer the following premiums, viz.: 150l. for the best, 100l. for the second, and 50l. for the third best design. Designs must be sent in on or before the 1st day of MAY next.—Printed instructions, together with the plans of the site, and of the present buildings, may be obtained (price 10s. 6d. which will be returned to those who forward designs) at the office of the Grand Secretary, Freemasons' Hall, London, W.C.

CONTRACTS.

EXTENSION of TIME for receiving TENDERS.—CITY of LONDON, BARBERS' HALL.—Important SITE for WAREHOUSES or MANUFACTURING PREMISES in the immediate vicinity of Wood-street, Cheapside.—The Committee of the Worshipful Company of Barbers will meet at their Hall on THURSDAY, the 26th day of MARCH, 1863, to receive TENDERS for LETTING, on a Building Lease for 99 years, the Extensive PREMISES known as Barbers' Hall, situate in Monkwell street, Wood-street, comprising three houses fronting Monkwell street, Nos. 33, 34, and 35; part of the courtyard in the rear thereof, the passage leading thereto, and the greater portion of the Company's Hall, together with the kitchen, scullery, and outbuildings, having a frontage towards Monkwell street of about 85 feet, by an average depth of about 60 feet, and an extreme depth of about 140 feet.—For particulars, with a plan of the property, elevation and section of street-front, also conditions of letting, may be obtained on application to the Clerk of the Company; to Mr. CHARLES JOHN SHOPPEE, the Company's Surveyor, No. 61, Doughty-street, W.C.; or to the Beadle at the Hall.—By order,

HENLEY GROSE SMITH, Clerk.

4, Warnford court, Throgmorton street, E.C.

ERECTION of WORKHOUSE. — To CONTRACTORS, BUILDERS, &c.—PARISH of ST LEONARD, SHOREDITCH, MIDDLESEX.—The Board of Guardians of the Poor of the above parish are desirous of receiving TENDERS from Contractors for the ERECTION of a NEW WORKHOUSE for the said parish, to be erected on the site of the present workhouse and adjoining premises, situate in the Kingsland road and Hoxton. Parties tendering will be required to find security to the amount of 20,000l. for the performance of the works in accordance with the drawings and specification. Such drawings and specification can be seen, and all information obtained, at the Office of the Architect, Mr. WILLIAM LEE, St. Michael's House, Cornhill. Bills of quantities may be obtained on payment of 1l. 1s. which sum will be returned to the parties tendering whose Tenders are not accepted. Tenders are to be addressed to the Board of Guardians, and endorsed "Tender for erection, &c. of New Workhouse," and must be delivered at the Board room, Kingsland road, London, N.E. not later than SIX o'clock in the evening of WEDNESDAY, the 25th day of FEBRUARY, 1863. The Guardians do not pledge themselves to accept the lowest or any other Tender. Parties tendering must be present, by themselves or their agents, at the time of meeting. By order of the Board,

WILLIAM NIGHTINGALE, Clerk.

Board-room, Kingsland road, 4th February, 1863.

BOARD of WORKS for the LIMEHOUSE DISTRICT. To PAVIORS and MASONS.—Notice is hereby given that the Works Committee will meet on TUESDAY, the 3rd day of MARCH, 1863, to receive TENDERS from persons willing to contract for the GENERAL WORKS and REPAIRS to the footand carr. ways of the several streets, &c. &c. &c. and other places under the jurisdiction of the said Board, for the years ending the 25th day of APRIL, 1865. Further particulars may be known, and printed conditions, schedules of works, and forms of Tender obtained, by parties intending to Tender for the works, upon application at the Office of the Board, White Horse-street, Commercial-road East, between the hours of TEN and FOUR o'clock, upon payment of twenty shillings, which will be returned to each person sending a Tender. Tenders, sealed up and endorsed "Tender for Paviors' and Masons' Work," must be delivered at the said Office not later than FOUR o'clock p.m. on the 2nd day of MARCH next. The Board do not bind themselves to accept the lowest or any Tender. The security of two responsible persons will be required, and the contractor will have to pay the rate of the current Day Wages. No Tender will be received after the time specified, nor unless strictly in accordance with the printed instructions.—By order,

THOS. W. RATCLIFF, Clerk to the Board.

Dean Colet House, White Horse-street, Commercial-road East, February 10th, 1863.

TO BUILDERS. — Builders desirous of TENDERING for the ERECTION of the NEW SCHOOLS and TEACHER'S RESIDENCE, at Pavenham, Beds., may have see the drawings and specifications at the School-master's House, Pavenham, Tenders to be delivered at the Office of the Architect, Mr. JOHN COLSON, 37, Smith-street, Westminster, by SIX o'clock on the 25th inst. No pledge given to accept the lowest or any Tender.

February 7th, 1863.

[For remainder of Contracts see next Page.

CONTRACTS.

PADDINGTON.—TENDERS will be received by the Vestry of Paddington, on or before MONDAY, the 2nd day of MARCH next, at 12 o'clock, for CONTRACTS for the EXECUTION of the DAY and JOBBING WORKS of the Parish during the ensuing year, viz.:—Paving, repairing, and cleansing sewers, stone and flint walling, water-carting, &c., within the Parish of Paddington.

Forms of Tender may be had on personal application at the Vestry Hall, Harrow-road, between the hours of TEN and TWELVE, and the 2nd day of MARCH. The Vestry do not bind themselves to accept the lowest or any tender, and the party whose Tender may be accepted will be required to provide two sureties in the sum of 500*l.* jointly and severally, for the due performance of the contract.—By order,

FRED AVELING, Vestry Clerk.

Paddington, February 18th, 1863.

TO MASONS, PAVIORS, and OTHERS.

The Vestry of the Parish of St. George-in-the-East will meet at the Vestry Hall, on FRIDAY, the 27th day of FEBRUARY, at SIX o'clock in the evening, to receive TENDERS for the SUPPLY of the MATERIALS and the EXECUTION of the JOBBING WORKS required to be done within the Parish during the ensuing year, and for the repairing and relaying the carriage-road from Cannon-street-road to Cable-street for a term of three years, from the 25th MARCH next, as the said Vestry may determine. Specifications and forms of Tender may be obtained at the Vestry Hall on payment of 5*s.*, which sum will be returned the day after the receipt of such Tenders. Any Tender not upon the printed form of the Vestry will be rejected. The person whose Tender shall be accepted will be required to enter into and seal two sufficient securities for the due performance of the bond and contract will be required to be sealed by the Vestry. The Vestry do not bind themselves to accept the lowest or any Tender.

W. L. HOWELL, Vestry Clerk.

Vestry Hall, February 16th, 1863.

TO SCAVENGERS, DUST CONTRACTORS, MASONS, PAVIORS, CARMEN, and OTHERS.—The Vestry of the Parish of St. George-the-Martyr, Southwark, are prepared to receive TENDERS for SCAVENGING and WATERING, for the REMOVAL of DUST, &c., for MASONS' and PAVIORS' WORK, for supplying GURNSEY GRANITE and SPALLS, ROCHESTER FLINTS, YORKSHIRE PAVING; and for HIRE of CARTS, HORSES, and DRIVERS. Forms of Tender and particulars may be obtained at the Vestry Clerk's Office, Vestry Hall, Borough-road, on Monday, where Tenders, if not delivered before, will be received up to Four o'clock in the evening of TUESDAY, the 3rd day MARCH, 1863, and at which time and place the parties tendering, or their representatives, may attend. The Vestry does not engage to accept the lowest or any Tender.—By order,

DANIEL BIRT, Vestry Clerk.

Vestry Hall, Borough-road, S.E.

SURREY COUNTY HOSPITAL, proposed to be erected at Guildford.—NOTICE TO BUILDERS.—Builders desiring to TENDER for the several WORKS required to be done in finishing this Hospital, and described in the Plans, Specifications, and Conditions which are prepared by Mr. EDWARD W. LOVER, the Architect, 12*a*, High-street, Guildford, and which are to be seen there, and at the Office of the Clerk of the Works to the Hospital, and may be had after the 16th day of FEBRUARY instant, and not earlier, on the Payment of Five Guineas for each Plan, each party must pay the sum of Five Guineas to the Secretary of the Hospital), and not to be had before that day, are desired to send in their Tenders, sealed up, addressed to the Chairman of the Building Committee, at the Hospital, Guildford, on or before Four o'clock in the afternoon of TUESDAY, the 10th day of MARCH next, at which time and place the Tenders will be opened in the presence of such Tenderers as may attend.

Each Tender must be delivered in the form prepared by the Architect, and must be signed by the person or persons tendering, as well as by the persons proposed as sureties, who will be required, in accordance with the terms of the Contract and Bond, to enter into Bonds, in the penalty of One Hundred Pounds, for the faithful performance of the Contract.

No Tender will be received unless delivered in the Box at the Hospital, and not later than Four o'clock in the afternoon of the day of MARCH next.

The Building Committee reserve to themselves the absolute right to reject the Tender of any of the Tenderers. Security from two responsible persons, to be approved by the Building Committee, will be required for the due performance of any contract entered into; and the person whose Tender may be accepted, will be required to pay one half of the expenses of the stamp duty on the contract and bond.

C. R. DALLAS (Clerk), Hon. Sec.

Uplands, Guildford, 11th February, 1863.

TO IRONFOUNDERS and CONTRACTORS.—SHARD BRIDGE, in the County of Lancaster.—The Directors of the Shard Bridge Company, incorporated by Act of Parliament, are prepared to receive PLANS, SPECIFICATIONS, and TENDERS for the ERECTION of an IRON GIRDER BRIDGE, upon new piers, across the River Wyre, at the Shard, near Poulton-le-Fylde, in the county of Lancaster. The piers are two in number, the head of the arches, the width of roadway required, with sections of the ironwork, and all other necessary particulars may be obtained on application to Messrs. MYRES & VEEVERS, Civil Engineers, Preston, to whose firm, upon delivery, all Tenders must be sent, on or before MONDAY, the 16th day of MARCH next. The directors will not bind themselves to pay for plans or drawings of the bridge which are not accepted.—By order,

RICHARD MOORE, Solicitor to the Company.

Kirkham, Lancashire, February 14th, 1863.

TO BRICKMAKERS.—The Directors of the Midland Railway Company are prepared to receive TENDERS for the SUPPLY of BRICKS, for the three Houses Tunnel, on the Bawsley and Hasock Extension Railway, near Higginsvale Farm. Thousands will be required, and Tenders may be delivered, and must be delivered for separate Tenders, of one thousand and upwards, specifying the sum per thousand at which they will undertake to supply the Bricks, on the completion of the Tunnel, ready for the delivery of the Bricks, on the specification and plan of Tender, by applying to the Resident Engineer, Mr. CAMPION, at the Office, at Ash-well Tenders to be delivered to G. N. BROWNE, Esq., Secretary, Derby, on or before MARCH 25th, 1863. The Directors do not bind themselves to accept the lowest or any Tender.—By order,

G. N. BROWNE, Secretary.

Derby, February 17, 1863.

TO BUILDERS.

PERSONS desirous of TENDERING for a VILLA RESIDENCE and STABLES at Leith, Kent, can have a copy of the drawings and specification for the same by applying at Mr. H. FORD'S Office, 1, Charlotte-row, Mansion House, E.C. Tenders to be delivered on MONDAY, MARCH 2nd.

TO BUILDERS and OTHERS.—SAINT MARY, ISLINGTON, in the County of Middlesex.—METROPOLIS LOCAL MANAGEMENT ACT.—Notice is hereby given that a Committee of the Vestry will meet at the Vestry Offices, Upper Street, on WEDNESDAY, the 25th day of FEBRUARY, 1863, at HALF PAST SEVEN o'clock, the Evening precisely, to receive TENDERS for the DAY WORK, JOBBING WORKS in connexion with the same, and the supply of such Materials. The forms of Tender and Vestry, where same may be had at the above Office, on payment of 2*s.* 6*d.* Sealed Tenders must be sent in before HALF PAST SEVEN o'clock on the day above mentioned. Persons tendering are requested to attend at the meeting of the Committee. The Vestry do not bind themselves to accept the lowest or any Tender.

JOHN LAYTON, Vestry Clerk.

Vestry Offices, Upper-street, Islington, February, 1863.

THE GUARDIANS of the POOR of the BIRKENHEAD UNION, in the county of Chester, are prepared to receive TENDERS from competent persons desirous of contracting to execute the WORKS required for PAVING and DRAINING a portion of the new Workhouse, situate at Heath Tramway. A separate and distinct Tender will be required for the following Lettings. The whole to be executed according to plans and specifications which may be seen at the Office of Mr. THOMAS LAYLAND, Architect, 20, Castle-street, Liverpool. Sealed Tenders, to be left at the Workhouse, Heath Tramway, Birkenhead, or before noon on SATURDAY, the 28th day of FEBRUARY, are requested "Tenders for Paving," and will be required for the due performance of the Works contracted for. The Guardians do not bind themselves to accept the lowest or any Tender.

PETER GREGORY, Clerk to the Guardians of the Birkenhead Union.

60, Lord-street, Birkenhead, February 3rd, 1863.

SAINT MARY, ISLINGTON.—CONTRACTS for PAVING and MATERIALS, for the REPAIR of ROADS, and the REMOVAL of the ROAD SCRAPINGS.—The Highways Committee of this Vestry will meet at the Vestry offices, Upper-street, Islington, on TUESDAY, the 24th day of FEBRUARY instant, at seven o'clock in the evening precisely, to consider proposals for PAVING the PARTS of the PARISH, and Repairing and Keeping in Repair the Paved Footways for ensuing three months. No Vestry shall receive time to take a street; also, for supplying the Vestry with Granite, Basket, Gravel, and Core, and steam Paints, in such quantities, and to be delivered at such places as the said Vestry shall from time to time direct; also, for Carting the Broken Stone, and for a supply of Peaning and Cairns for the two divisions of the parish; also, for the Removal of the Road Scrapings.—The Tenders for the supply of the Road Scrapings to be separate for each of the said wards; and no contract is to be permitted to contract for more than two of such wards. The whole to be contracted for from the 25th day of MARCH next, to the 29th day of MARCH, 1864.—Forms of Tender (which alone will be received) may be had, and the draft contract may be seen, on application at the Vestry Offices, between the hours of TEN and FOUR daily. All Tenders are to be sealed up, and left at the Vestry Offices before the hour of meeting; and a Tender will be received unless it contains 10*l.* Bank of England note, which will be immediately returned to each person whose Tender is not accepted; but which is retained in the case of success, until the contract and bonds are duly signed. The Vestry do not bind themselves to accept the lowest or any Tender.

JOHN LAYTON, Vestry Clerk.

Vestry Offices, Upper street.

TO BUILDERS.—Persons desirous to TENDER for the ERECTION of new Presbyterian CHURCH and SCHOOLS at Aldershott, are to see the plans, &c., at Mr. THRUPP'S Royal Hotel, Aldershott, on and after Monday, 23rd inst. Copies of quantities will be supplied on application at the above Hotel, for the sum of 5*s.* each. Tenders to be sent to me on or before the 16th day of MARCH next. Neither the lowest nor any Tender will necessarily be accepted.

C. B. MUSSELLWHITE, Architect, Basingstoke.

TO BUILDERS.—TENDERS are required for the ERECTION of a NEW TOWNHALL for the Town Council of the Borough of Bridgwater, on or before the 2nd day of MARCH next. Plans and Specification for the same may be seen at the Office of Mr. ROWLEDGE, Architect, High-street, Bridgwater. The lowest or any Tender will not necessarily be accepted. Quantities supplied.

Dated 12th February, 1863.

BOARD of WORKS, WHITECHAPEL DISTRICT.—A meeting of the Board will be held on MONDAY, the 23rd day of FEBRUARY, 1863, at SIX o'clock in the evening, at the Office of the Board, No. 15, Great Alie-street, White-chapel, to receive TENDERS for CLEANSING the STREETS and ALLEYS, and for REMOVING the DUST and other REFUSE within the district for the period of one year, to commence from the 1st day of APRIL next, and for WATERING the ROADS and STREETS of portions of such district, for the period of five months, to commence from the 1st day of MAY next. Persons disposed to contract may obtain printed forms of the several Tenders, and such information as they may require, at the Office of the Board. Sealed Tenders, in which a 10*l.* note is to be enclosed, must be delivered at the said Board, before, FOUR o'clock in the afternoon of the day of the meeting, and must be made upon the printed forms prepared by the Board, and duly signed by the person or persons tendering, as well as by the persons proposed as sureties, will be required. Persons tendering are required to attend the Board at HALF PAST SIX o'clock, in order that a preliminary agreement may be signed by the person whose Tender is accepted.—The Board, however, do not bind themselves to accept any Tender.

ALFRED TURNER, Clerk to the Board.

15, Great Alie-street, Whitechapel, February 9, 1863.

TO BUILDERS and CONTRACTORS.—Persons desirous of TENDERING for the ERECTION of a New CHURCH at Charlton Kings, near Cheltenham, may inspect the plans and specification at the Office of the Architect, No. 467, High-street, Cheltenham, and after Monday, the 23rd inst., at the Vicarage, Charlton Kings, or from Mr. Jones, of Tenter Field, Charlton Kings, to be sent to G. RIDGE, Esq., Solicitor, 1, Promenade Buildings, Cheltenham, on or before the 12th day of MARCH next. The Lowest or any Tender will not necessarily be accepted.

GEORGE W. SADLER, Architect.

Cheltenham, February 14th, 1863.

CALNE RAILWAY COMPANY.—The Directors are prepared to receive TENDERS for the ERECTION of STATION BUILDINGS at Calne. Plans and specifications can be seen at the Office of Mr. JAMES BARNES, Engineer, 1, Victoria-square, Westminster, and at the Office of the Secretary at Calne, Tenders, addressed to the Directors, to be delivered at the Secretary's Office, on or before the 4th day of MARCH next. The Directors do not bind themselves to accept the lowest or any Tender.

Calne, Feb. 19, 1863. W. M. VIZARD, Secretary.

TO CONTRACTORS, BUILDERS, &c.—TENDERS are invited for the ERECTION of a PIER at Pwllgwin Harbour, and for a WINDMILL, WORKSHOPS, and MILL DAM, on one, or the first in one and the last in separate Contract. Specifications may be had by letter addressed to Mr. HENDERSON, Penrhyn, Haverfordwest; and plans may be seen at the Office of W. H. COGSWELL, Esq., C.E., 15, Queen-street, Mayfair, South Wales; or at the Office of Messrs. HEWETT & GRIFFITHS, Parliament-street Quarries, Tremine, Haverfordwest, to whom Tenders must be sent on or before the 1st day of MARCH. The Directors do not bind themselves to accept the lowest or any Tender.

TO CONTRACTORS and Others.—The LOCAL BOARD of HEALTH for the District of Sherborne, in the County of Dorset, are desirous of receiving TENDERS for the execution of the necessary WORKS connected with the CONSTRUCTION of the LAYING, and JOINTING of about 1,1?0 Yards lineal of 6 Inch Cast Iron Water Pipes, according to Specifications, which may be seen at the Offices of the Board's Engineers, as under, and can be obtained by letter addressed to them. Tenders to be sent in to Mr. J. Y. MELMOTH, Solicitor, Clerk to the Board, on or before TUESDAY, the 24th inst. The Board do not pledge themselves to accept the lowest or any Tender.—By order,

C. S. NEWMAN, C.E.

The Green, Sherborne, Dorset, 9th February, 1863.

TO IRON FOUNDERS.—The Local Board of Health for the District of Sherborne, in the County of Dorset, are desirous of receiving TENDERS for the SUPPLY of about 1,100 YARDS LINEAL of CAST-IRON SOCKET PIPES, of an internal diameter of 8 inches, for the purposes of water supply, according to specifications which may be seen at the Offices of the Board's Engineers, as under; where also every information may be obtained. Tenders to be sent in to Mr. J. MELMOTH, Solicitor, Clerk to the Board, on or before TUESDAY, the 24th inst. The Board do not pledge themselves to accept the lowest or any Tender.—By order,

C. S. NEWMAN, C.E.

The Green, Sherborne, Dorset, 9th February, 1863.

FREEHOLD GROUND between the Forest Hill and Sydenham Stations TO BE LET on long Building Leases.—For plan and particulars, apply to C. F. REEKS, Esq., Architect, 12, Middle Scotland-yard, S.W.

TO BUILDERS and OTHERS.—TO BE LET, several PLOTS of BUILDING LAND, situate in the best part of Stoke Newington, where Leases are in great demand. Rent as high as 10*l.* per rood. Also a large Piece of Land now let on the ground for building purposes. Apply to Mr. RODDA, at the Estate Office, Rectory-road, Church-street, Stoke Newington.

CATERHAM, on the Surrey Hills, 17 miles from London.—LAND TO BE SOLD or LET, in plots of from 1 to 50 acres, for first-class residences, either on the hill or in the valley. Healthy soil. Ample supply of the best spring water to the top of the highest.—Apply to Mr. R. MARTIN, Estate Office, Caterham.

FREEHOLD BUILDING GROUND, about 30 feet by 44 feet, in Pregent square, Old Bailey, Ludgate-hill, close by Farringdon street Station, TO BE SOLD.—Apply to Mr. PARIS, Surveyor, Walsingham place, Lambeth.

PHILBROKE ESTATE, at Leytonstone, on the Woodford and Loughton Railway, twenty minutes from Fenchurch and Bishopsgate Stations.—This valuable FREEHOLD ESTATE, land tax redeemed, surrounding the Station, healthy locality, gravelly soil, excellent drainage, water and gas laid down, roads made, sand cartage on the estate, it is proposed TO LET in Plots suitable for building detached and semi-detached villas. Separate applications have been made for houses in this neighbourhood. For terms, apply to Mr. ATHEY, at the Surveyor's Office, Philbroke Estate, Leytonstone, Essex.

WOODFORD RAILWAY.—The GROVE, WANSTEAD.—Portions of this beautiful Estate are now TO BE LET for Building purposes, and Villa Residences are much required in the locality. Soil gravel, situation healthy, and water excellent. The Snaresbrook Station is 400 yards only from the Estate, and the City is reached in twenty-five minutes. The Leases will contain a clause entitling the Lessee to purchase a Freehold within a specified time. LAND also TO LET at Blackheath, Tottenham, Kingston; some very eligible SITES in the Grove road, Milkwood, a few of which are adapted for shops, and large and very CHEAP PLOTS TO LET, at Ealing.—Apply to Mr. KNIGHTLEY, Architect, 25, Canon-street.

ST. HELEN'S, Lancashire.—TO BE LET on LEASE, the extensive MANUFACTURING PREMISES at the Bleaching and Calico Printing Works, situate at St. Helen's, with a wharf on the canal, and a branch of the St. Helen's Railway running through the property. The entire site is about twenty acres, of which about five acres are occupied by the works, the remainder being arable and pasture land. The buildings comprise a series of very substantially erected, light, and lofty ground floor factories, arranged for the purposes of copper and silver-roofing works; but they will be available for many other large manufacturing establishments, as they possess the advantages of direct communication by rail or water carriage with all parts of the kingdom. Coals can be obtained from pits in the neighbourhood at an almost nominal price, and clay is cheap and abundant.—For particulars apply to Messrs. FULLER and HORSEY, Billiter-street, Fenchurch, E.C.; and Messrs. HARRISON & FINCH, 2, Gray's Inn, London.

BUILDING LAND TO LET, at Canonbury, Haverstock-hill, Lower Norwood, close to the station (for large and small houses), at Croydon; also at Edward's-road, Bow, carcases for completion. The usual advances made.—Apply at the Office of Mr. JAS. KIMBERLIN, Architect and Surveyor, 3, Crown-court, Old Broad-street, E.C.]

EXTENSIVE MANUFACTURING PREMISES, South-wark.—TO BE LET on LEASE, extensive MANUFACTURING PREMISES, occupying a very large area, situate in the Borough-road, Southwark. The buildings, which are very substantially erected, comprise a very large factory of three lofty floors, with basements; a smaller factory of four floors adjoining, a very spacious and lofty ground-floor factory, yard, a capital family residence and counting-house, two good cottages, and three dwelling-houses fronting the Borough road, Nos. 77, 78, and 79, which can be readily let off if desired.—For further particulars apply on the Premises; or to Messrs. FULLER & HORSEY, Billiter-street, Fenchurch-street, E.C.

EXTENSIVE MANUFACTURING PREMISES, WHITECHAPEL TO BE LET or SOLD, together or separately, the extensive and important RANGE of PREMISES, recently occupied as the Whitechapel Distillery, with land adjoining, fronting Whitechapel-road, and Sidney-street, extending to a depth of 200 feet, are substantially erected, principally in 1845, and very conveniently arranged for almost any manufacturing purpose. There are three large Carriage entrances, and the land lying on all sides are surrounded with paved yards. The total area is about three acres, exclusive of six acres of accommodation land, which may be had if required. There is an extensive well, with a never-failing and large supply of pure water.—Further particulars and cards to view may be had of Messrs. TENNANT & DARLEY, Solicitors, Raymond's-buildings, Gray's Inn; and Messrs. FULLER & HORSEY, Billiter-street, E.C. where plans of the property may be seen.

THE DIRECTORS of the ROYAL CALEDONIAN ASYLUM, having a desire to remove their Institution some distance from town, will be glad to treat with any person requiring such premises, for the SALE of the present BUILDINGS, with the Land attached, containing nearly four acres of ground, most eligibly situated in the CALEDONIAN-ROAD, near the New Cattle Market, Holloway.—For particulars apply to the Secretary, Mr. DANIEL, at the Asylum, Holloway, N.

Royal Caledonian Asylum, Feb. 11th, 1863.

BUILDING LAND TO BE LET, HACKNEY, close to the Railway Station, for small Dwelling Houses.

NORWOOD, close to the Crystal Palace, for Shops and Villas.

PERRY-HILL, SYDENHAM, for Shops. Advances in each case if required.—Apply to Mr. T. K. GREEN, 25, College-hill, Cannon-street, E.C.

TO BUILDERS.—SPACE for Six Detached Cottages TO BE LET, near Norwood Junction. Money advanced.—Apply to JOHN WILLIAMS, Esq. No. 3, Church court, Clement's-lane, City.

BUILDING LAND, facing Kensington Gardens Broad-walk.—TO BE LET or SOLD, PLOTS for twelve first-class Houses.—Apply, by letter, to Mr. HOWELL, Mansfield street, Portland-place; or to H. FIELD, Esq., 6, Lincoln's-inn-fields.

LITTLE HEATH BRICKFIELD, Cobham, Surrey.—TO BE LET, for the season or for a term, this FIELD, situate about three miles from the Esher Station, where there is a store-shed, and about 2½ miles from the Leatherhead Station. Excellent red bricks, for which there is a large demand, can be made with a small outlay. Further particulars, and stock bricks, pipes, tiles, &c. If let only for the season, the proprietor would purchase all brick left unsold at Christmas next, at a price to be fixed beforehand. Further particulars can be had, and samples seen at Mr. ASHFIELD'S, Builder, 3, Baynes-row, Coldbath-fields, London; or at the Esher Station.

MAYFIELD ESTATE.—Orpington, Kent. Several PLOTS of a part of this pictures ue Estate TO BE LET on BUILDING LEASES, frontages to the High-road. It is an eligible opportunity for a respectable builder to secure a return for money invested in building. The soil is good, partly chalk and gravel, very dry, and the surrounding country undulating. Station for Orpington, St. Mary's Cray, the London, Chatham, and Dover Railway.—For Plans of the Lands and Houses proposed to be erected, as well as those already completed, apply to CHARLES G. STAPELTON, Junr., Architect, 69, Cannon-street, London, E.C.

CHELSEA.—BUSINESS PREMISES TO BE LET, situated No. 26, King's-road, Chelsea, being the most commanding premises in the parish. Suitable for workshops, warehouses, and show-rooms.

GROUND TO BE LET, immediately, on building lease, ninety-nine years. About 2½ feet frontage in the main road. Two minutes' walk from the Station at Addiscombe, Surrey. Gravelly soil.—Apply to R. T. THORN, 59, Bucknall-street, Lonnon, E.C.

BUILDING LAND TO BE LET or SOLD, at Sydenham, near the Church, the Railway Station, the Crystal Palace, and Park. It fronts a wide, handsome road-way, and has ample depth for garden grounds. All the leases on the estate are of 99 years, and the rents obtained give an average return of 12 per cent on the outlay. The remaining frontage will be let on low rents, to secure the ground being speedily covered.—Terms and particulars of Messrs. EDWIN FOX & BOUSFIELD, Land Agents 41, Cateaton-street, Bank, E.C.

ST. PANCRAS IRON WORK COMPANY,

OLD SAINT PANCRAS ROAD, LONDON, N.W.

PATENT WROUGHT-IRON STABLE FITTINGS

SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—

That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick, or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, WITH RACK AND WATER-TROUGH,

The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.

These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible; advantages peculiarly their own.

THE PATENT HARNESS FITTINGS

Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.

EVERY DESCRIPTION OF STABLE FURNITURE.

The PRIZE MEDAL for SUPERIOR PATENT SASH and BLIND LINES, was awarded to JAMES AUSTIN, at the INTERNATIONAL EXHIBITION, 1862

AUSTIN'S IMPERIAL PATENT SASH AND BLIND LINES,

To BUILDERS, CARPENTERS, and BLIND MAKERS.

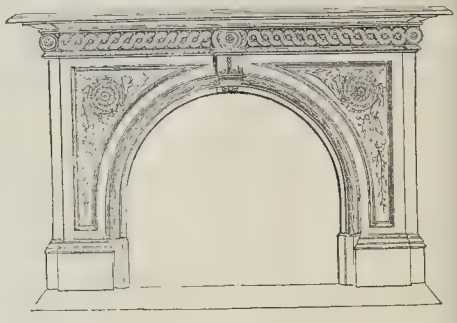
J. AUSTIN, Manufacturer of the above articles, respectfully wishes to direct the attention of the Trade to his

IMPERIAL PATENT FLAX SASH-LINES

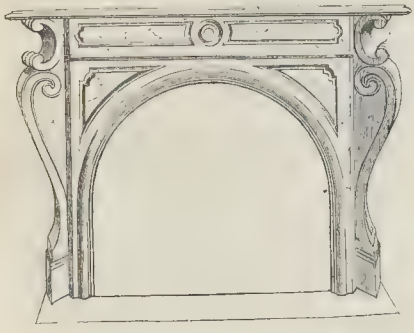
of which he is now making four qualities, and he strongly recommends that no Lines than the best should be used in preference to the PATENT LINES, many lots of which are less in size than the STRENGTH and DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.

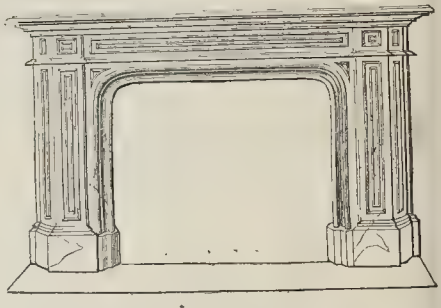
ESTABLISHED 1774.



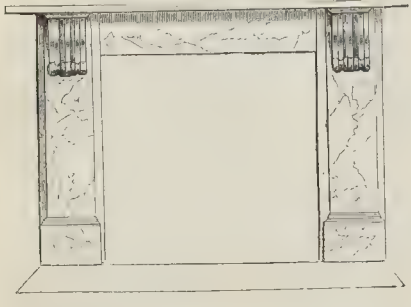
THE RICHEST ASSORTMENT OF CHIMNEY-PIECES



IS AT



WILLIAM S. BURTON'S.



It embraces the following Foreign and English Marbles:—Italian Statuary, Brocatelle d'Italie, Brocatelle d'Espagne, Brocatelle Brune, Griotte d'Italie, Jaune Fleuri, Vert Antique, St. Remis, Black and Gold, Black, Rouge Royale, Vein, &c. &c.; and it includes the undermentioned styles: Renaissance, Louis XIV., Louis XV., Pompadour, Louis XVI., Moderne, à Balustres, &c. &c. Most of the designs are new; while several, from their rich and exquisite sculpture, are veritable works of art. A complete assortment of Enamelled Slate Chimney-pieces is also on show, including many elegant designs. The Prices range from 1*l.* 8*s.* to 100*l.*

SIMPLICITY, UTILITY, ECONOMY, AND DURABILITY.

THOMAS PUGH & CO.'S NEW PATENT ECONOMIC SELF-ADJUSTING MORTISE AND RIM LOCK FURNITURE:

BOND & SCAMMELL (late Thomas Pugh & Co.)

NUT PLATE.

WHOLESALE IRONMONGERS,
13, KING STREET, SNOW HILL, LONDON.

We invite particular attention to the PATENT LOCK FURNITURE, which we do not hesitate to say is the most perfect article now manufactured, great improvements having been recently made in it. It has been extensively used in public and private buildings, in Her Majesty's Pavilion and Camp at Aldershott—alone, many hundred sets without one single failure. It is applicable to all Locks and Latches, both rim and mortise, and effects a most secure fastening, without any screw in the neck of the knob. Perfect action guaranteed in both Locks and Furniture, if the Locks are of our own manufacture.

New rich designs in glass, china, brass, bronzed, gilt, carved woods, inlaid, &c. &c. or to any design.

THIS FURNITURE MAY BE HAD WITH PLATES OR NUTS.

A most complete and extensive stock of every description of locks, latches, brass foundry, and ironmongery, required for buildings, of the best quality manufactured, at the lowest wholesale prices.

*** Illustrations and particulars sent upon application.

MANTEL PIECES, ENGLISH AND FOREIGN,

IN EVERY VARIETY OF DESIGN AND COST,

Have been added to their LARGE and EXCELLENT ASSORTMENT of FINE FINISHED STOVES FENDERS, &c. in the NEW SHOW ROOMS of the

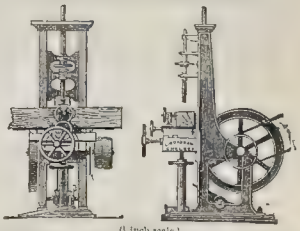
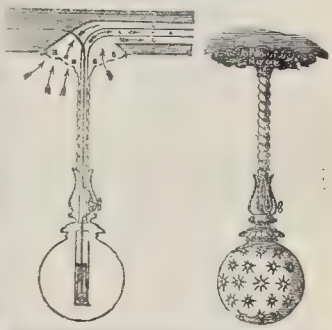
PATENTEES,
AND
Makers of Sawing Planing, Moulding, and other Woodcutting Machinery.



IMPROVED VERTICAL SAW,
For Cutting out Sweeps and Circles.
Price 20*l.*

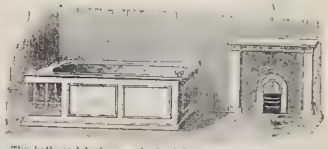
Drawings sent on application.

MACHINERY TO BE SEEN AT WORK IN ROCHDALE.
LONDON OFFICE, CANNON STREET, E.C.



S. WORSSAM & CO.'S PATENT
IMPROVED POWER MORTISING MACHINE.

(¼ inch scale.)



Combining many improvements not to be found in any other mortising machine. A single machine, worked by a man, with a boy to assist him, will do all work usually done by seven or eight persons, or as four by the above. For prices, &c. apply at the Works, 304, King's-road, Chelsea, S.W.

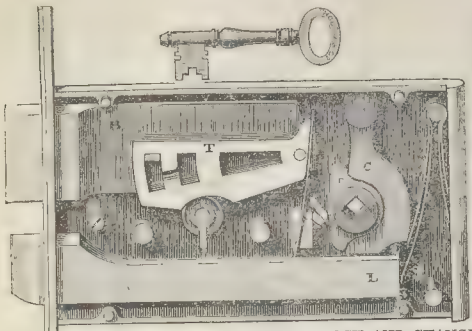
RICKET'S & HAMMOND'S
VENTILATING GLOBE LIGHT,
combining an agreeable method of lighting, with convenient simple, and efficient ventilation.

The advantages obtained are these—
A TOTAL REMOVAL OF ALL PRODUCTS OF COMBUSTION.
A COMPLETE DISPLACEMENT OF HEATED AND VITIATED AIR,
AND A CONSIDERABLE ECONOMY IN THE CONSUMPTION OF GAS.
A GLOBE LIGHT will consume 5 to 7 feet of gas per hour, giving as much light as an ordinary three light chandelier, with a consumption of 12 feet per hour.
5, AGAR STREET, STRAND, LONDON, W.C.

J. TYLOR & SONS' PATENT BATH
APPARATUS.

The bath and boiler may be fixed in the same or separate rooms, anywhere below the level of cold-water cistern. Open or close fire at pleasure. No brickwork setting for boiler required.
Estimates given from architects' drawings, or by inspection of buildings.
Catalogues, containing Nine Illustrations of different methods of heating baths, sent on application to the Manufacturers, J. TYLOR & SONS, Warwick-lane, Newgate street, London.

PAIR of HORIZONTAL HIGH-PRESSURE and CONDENSING STEAM ENGINES, each of 25 h.p. nominal power FOR SALE by private contract. The cylinders are 14 inches diameter, 2 feet stroke, with metallic pistons, bright connecting rods, slide valves, eccentrics, 8 inch fly-wheel, shaft, crank, cast-iron fly-wheel 14 feet diameter, spur mortise wheel 8 feet diameter, and pinion, exhaust-pipe, cast-iron condenser, cast iron frames, steam and vacuum gauges, pair of Hunt's governor balls and separator, made in 1851. For further particulars apply to Messrs. FULLER & HORSEY, 13, Billiter-street, London, E.C.



INTERNATIONAL EXHIBITION, 1862.—CLASS 31, LOCKS, &c. No. 6105.

HOBBS'S CELEBRATED MACHINE-MADE LEVER LOCKS,

Suited for all purposes, at Prices that silence competition.

SUITES OF LOCKS FOR MANSIONS, WAREHOUSES, AND OTHER LARGE STRUCTURES, WITH OR WITHOUT MASTER KEYS.

PUBLIC BUILDINGS OF EVERY KIND FITTED.

The parts in the Plate marked F and C show the form of Hobbs's Patent Frictionless Follower and Crank, by which a rolling instead of a rubbing motion is produced, thereby preventing friction.

S, s, shows the double spring, by which means the Latch is allowed to work independent of the Crank in shutting the door, thereby avoiding the necessity of slamming; at the same time sufficient strength is given by the Follower Spring to throw the heaviest knobs or handles.

HOBBS' PATENT FRICTIONLESS FOLLOWER, & DOUBLE SPRING FOUR-LEVER MORTISE LOCK, Price 8s.

FIREPROOF SAFES, IRON DOORS, CASH BOXES, &c.

HOBBS'S PATENT PROTECTOR LOCK, AND CHANGEABLE KEY BANK LOCK FOR SPECIAL SECURITY.

ESTIMATES AND ILLUSTRATED PRICE LISTS FURNISHED ON APPLICATION.

For specimens of all the varieties of these LOCKS, and the different stages of manufacture by machinery, from the first to the last process, see HOBBS'S STAND in the EXHIBITION, CLASS 13, No. 6105, ON THE SOUTH-WEST SIDE OF THE EASTERN DOME.

LONDON, W.

FIRE-PROOF CONSTRUCTION.—

FOX & BARRETT'S PATENT.

This improved system of fire-proof construction has been most extensively adopted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether public or private.

The system combines ECONOMY with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.

The floors and roofs are formed by a combination of joists of wrought or rolled iron with concrete, so constructed that each floor becomes in effect a beam of artificial stone with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring boards, or of cement, asphalte, tiles, slate, or other material.

Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as superseding the necessity for cast-iron girders and brick arches, and as bringing the great desideratum of fire-proof construction, even for ordinary dwelling-houses and mestic buildings, within the reach of every one.

Further information may be obtained of the Proprietor of the Patent,

MR. BARRETT,
12, YORK BUILDINGS, ADELPHI

CANNON IRON FOUNDRY 156, Goswell-street, St. Luke's,

JONES & BLAXTON, having made great additions to their STOCK of PATTERNS, beg to inform the Trade that they can now supply them with Plain and Ornamental Iron Columns, Girders, Railings, Gates, Iron Piping, Balconies, Window Guards, Verandahs, Ornamental Staircase Panels, Iron Staircases, Tomb Enclosures, Trellis Panelling, Lamp and other Brackets, Cantilevers, Newel Bars, Water-closet Work, Area Gratings, Fly and other Wheels, Wheel Plates, &c.

IMPORTANT TO ARCHITECTS, ENGINEERS, BUILDERS, RAILWAY, AND OTHER COMPANIES.

VIEILLE MONTAGNE ROOFING ZINC.

Company's General Agency, 12, Manchester Buildings, Westminster.

Zinc properly laid has been proved by most extensive and long experience in France, Belgium, and Germany to be a most secure, durable, and economical covering, and is now preferred to all other materials for roofs. Its extreme lightness makes it most valuable for covering buildings requiring large spans with comparatively light framing. On a rough calculation it may be estimated that not less than 41,000,000 square feet is the average quantity of Roofing surface now annually covered in the above countries alone. Within the last few years persevering efforts have been made to introduce into England proper workmanship, in accordance with the principles which are observed on the Continent, and which alone can secure the sound and perfect construction of a Zinc roof. To aid in extending as much as possible the knowledge of these simple rules, models showing all the details are to be seen in the Architectural Exhibition in Conduit-street, and the following, selected out of a very great number of recently constructed roofs, are referred to as examples:—The Patent Granary, West-India Docks; Copenhagen Works, Limehouse; a private house in Holland Park; Homes for Poor Merchants' Clerks, Muswell-hill; a large Warehouse, 77, Thames-street; Ship roof, Sheerness Dockyard; the Victoria Station, Pimlico; the Stations in the Metropolitan Railway; the Stations of the Madras Railway Company (400,000 feet); the Warehouse of Messrs. Oakes, Brothers, & Co. Madras (20,000 feet); the Refreshment Rooms at the Exhibition; the Verandah of the Horticultural Society's Conservatory; Gloucester Railway Station; Messrs. Horniman & Co.'s Tea Warehouse, Wormwood-street; Messrs. Hoare & Co.'s Brewery, Smithfield; Cape Town and Wellington Railway (60,000 feet); Fifty new Dwelling Houses at Palace Gardens-terrace, Kensington; Twenty ditto, Inverness-terrace, Bayswater.

Plans, Estimates, and all useful information will be furnished, without charge, by applying to either of the Directing Architects.

JAMES EDMESTON, 5, Crown-court, Old Broad-street.
R. G. FISHER, 12, Manchester-buildings, Westminster.

N.B. No covering can be more economical, durable, and secure than Zinc when well laid, but good Zinc badly laid will spoil the roof, and, with a view still further to encourage good work, a special Discount will be allowed to all persons upon the Zinc used in roofs, when certified by either of the above Architects to be properly laid.

THE PRIZE MEDALS

(LONDON, 1851. PARIS, 1855. LONDON, 1862
Awarded to

COTTAM & COMPANY,

2, WINSLEY STREET, LONDON, W.

For progressive and general improvements in

STABLE FITTINGS AND HARNESS BRACKETS.

Which have received the Patronage of

Patronised by the English and French Governments, as well as by the Nobility, Gentry, and Hunting Establishments in the Kingdom.

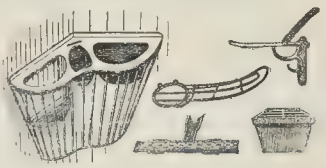
In use at her Majesty's Stables, Windsor and Balmoral.

COTTAM & COMPANY, Winsley-street, W. are the original Inventors of the PATENT ENAMELLED MANGER, Watertrough, and Wrought-iron Rack, united to an iron top-plate, and forming one complete and useful fixture, having COTTAM'S PATENT Noseless Hollow Bowl and Collar Rein attached, which is taken to the back of the manger, and works with ease and freedom up or down the groove.

COTTAM'S NEW PATENT SEED BOX, an important addition to the above fittings, being simple in construction, light, and durable, promotes cleanliness, and is economical in its results.

COTTAM'S PATENT PERMANENT ATTACHED DROP COVER, for the above, is a most essential addition to their fittings; it is never in the way; can be placed and replaced in an instant; while its cheapness, simplicity, and utility in keeping the contents of the mangers clean, and regulating the quantity to be taken, is quite sufficient to insure its use.

COTTAM'S PATENT SADDLE AND HARNESS BRACKET COMBINED



can be used with great advantage where space is an object, as it can be turned up out of the way when not in use.

COTTAM'S IMPROVED WROUGHT-IRON VENTILATING BRACKET preserves the shape and allows a free admission of air to the under parts of the saddle.

COTTAM'S IMPROVED SURFACE CUTTER, with perforated moveable cover, the use of which prevents chaff, dust, &c. being scattered about.

COTTAM'S CAST-IRON SANITARY TRAP, from its self-cleaning construction, gives a full water passage, and does not allow any steam to ascend from the drain.

PATENT LOOSE BOX FITTINGS, and every article for the harness-room and stable, kept in stock, plain, galvanised, and enamelled. Iron gates, fencing, hurdles, &c.

Illustrated Catalogues and Estimates gratis, upon application to

COTTAM & CO. 2, WINSLEY STREET, Oxford Street, London, W.

WHERE FULL-SIZED STALLS, LOOSE BOXES, AND HARNESS-ROOM, &c. ARE FITTED UP, SHOWING ALL COTTAM'S PATENT IMPROVEMENTS, &c.

COTTAM & CO.'S only address in London, is 2, WINSLEY STREET, W.

N.B.—WINSLEY STREET IS THE STREET OPPOSITE THE PANTHEON.

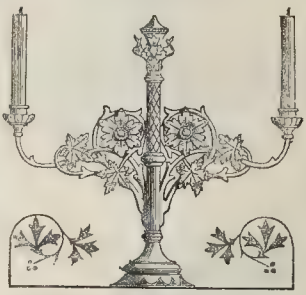
and 19, Graham street, London, E.C.

PATENTED HOT AIR APPARATUS in CAST IRON, consisting of prismatic tubes, to be applied to chimneys with flues and heat-conduits. By this system is obtained health, durability, a clear fire, security, economy.—An apparatus in use can be seen, every day, at the Office of M. LEWAL, Nos. 5 and 6, Philip's lane, City.

A HIGHLY-FINISHED 10-Horse Power High pressure STEAM ENGINE.
A Second-hand IRON RACK CIRCULAR SAW BENCH, and A small DOUBLE MOULDING MACHINE, TO BE SOLD cheap. Apply to S. WORSSAM & CO. Saw Mill Engineers, King's-road, Chelsea, S.W.

NOW OPEN, YOUNG'S IRONMONGERY WAREHOUSE,
No. 24, Davies-street, Three Doors from Oxford-street.
For the supply of Builders, Carpenters, Upholsterers, Smiths, Bell-hangers, and the Trade in general, at wholesale prices. In connection with his Old Establishment, No. 18, Blandford street, Manchester-square, running out of Baker-street, Portman-square, London, W.

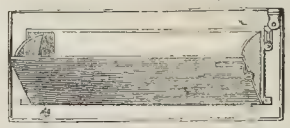
ROBERT MACLAREN & CO.
EGLINTON FOUNDRY, GLASGOW.
Manufacturers of all sizes of CAST IRON MAIN PIPES, for Gas or Water, by an IMPROVED PATENT.
GENERAL IRON FOUNDERS, GAS ENGINEERS, and WROUGHT IRON TUBE MAKERS.



TO IRONMONGERS AND THE TRADE GENERALLY.
D. HULETT & CO. Manufacturers of GAS CHANDELIERS, HALL LANTERNS, GLASS LUSTRES, &c. &c. A large assortment of the newest designs always on show, every article marked in plain figures. Patentees, and Manufacturers of the Metrical Gas Regulator. Complete Pattern-book and Price-lists, 12s.—Nos. 55 and 56, High Holborn.

THE MEDAL FOR 1862.
THE ONLY PRIZE MEDAL AWARDED FOR TUBES AND FITTINGS.
TRADE MARK.
CROWN TUBE WORKS,
WEDNESBURY, STAFFORDSHIRE
Warehouse—81, Upper Ground street, London, S.
JAMES RUSSELL & SONS,
The Patentees and first Makers of Wrought Iron Tubes.

PETERS AND ARCHER
MANUFACTURERS OF
MEDIÆVAL ART METAL WORK
159 · HIGH · HOLBORN · W.C



Book of Examples now out of print,—revised & enlarged Edition shortly, meanwhile, SPECIAL DESIGNS & ESTIMATES for WROUGHT IRON & BRASS Gates, Screens, Grilles, Altar & Tomb Railings, Hinges, Vanes, Crosses, GAS-FITTINGS,—Brackets, Standards, Gasteliers, Coronæ, &c., and *EVERY* other *DESCRIPTION* of METAL WORK for Domestic & Ecclesiastical purposes: As also for COMPLETELY & EFFICIENTLY Lighting Churches, Chapels & Public Buildings,—including SERVICE PIPES, METERS, &c., will be submitted upon application.

JOHNSTON, BROTHERS,
MEDIÆVAL METAL WORKERS AND GASFITTERS.

Manufactory, 190, High Holborn, London.
Specimens at the Architectural Exhibition, Conduit-street, W.
Drawings and Estimates furnished.

HART & SON,

WHOLESALE IRONMONGERS & MANUFACTURERS of ARNOTT'S and SHERINGHAM'S VENTILATORS.
Sliding and Revolving ditto of every description.
Proprietors and Manufacturers of PITT'S & CLARK'S PATENT SPINDLED DOOR-FURNITURE, in China, Glass, Ivory, Brass, and Wood.
FURNITURE DECORATED TO ORDER.
DESIGNS FURNISHED. PRICE LISTS on application.
53 to 58, WYCH STREET, STRAND, W.C.
and
20, COCKSPUR STREET, PALL MALL, S.W.

W. SHRIVELL,
LATE FOREMAN AT HART & SONS
GOTHIC METAL WORKER,
18 CASTLE ST. ENDELL ST.
LONG ACRE. LONDON.
GATES · RAILING · ROOF CRESTING · VANES · CROSSES AND ALL OTHER BRANCHES OF IRON AND BRASS WORK IN THE BEST MANNER AND AT THE LOWEST CHARGES. DESIGNS AND ESTIMATES FURNISHED.

POLONCEAU and LIMMER ASPHALTE.

ESTABLISHED  1838

For covering Flat Roofs, Paving and Flooring of every description, especially in places subject to damp and vermin. This Asphalte is now extensively used for paving Stables (as shown above), the absence of joints preventing the generation of ammonia. For Estimates and Prices, &c. &c. apply to JOHN FILKINGTON, 13, Fish street-hill, London, E.C.

Country Builders supplied with Asphalte in Bulk for covering Footings, Barn Floors, &c. with instructions to lay it down.

PRIZE MEDALLISTS OF THE GREAT EXHIBITION, 1851. **BUNNETT & CO.** ORIGINAL PATENTEES AND MANUFACTURERS.

Invite the attention of Architects, Builders, and the Public, to their recent Improvements in

REVOLVING IRON AND COPPER SHUTTERS,

Thief-proof and Fire-proof, varying in price from 3s. 6d. to 6s. 6d. per Foot super. according to description and quality, inclusive of the Gearing for raising and lowering them.

WORKS, DEPTFORD, KENT; LONDON OFFICE, 17, QUEEN-STREET, CITY; GLASGOW OFFICE, 199, BUCHANAN-STREET.

BY ROYAL LETTERS PATENT. **BUNNETT & CO.**

Invite the attention of Architects to a completely new

Combination of the Revolving Iron Shutter and the Louvre Blind,

Especially suitable for all Tropical or Semi-Tropical Climates, or for Private Mansions in England, where thorough Ventilation and Shade are required, together with perfect security.

WORKS, DEPTFORD, KENT; LONDON OFFICE, 17, QUEEN-STREET, CITY; GLASGOW OFFICE, 199, BUCHANAN-STREET.

PRIZE MEDALLISTS OF THE GREAT EXHIBITION, 1851. **BUNNETT & CO.** ORIGINAL PATENTEES AND MANUFACTURERS.

Invite the attention of Architects, Builders, and the Public, to the last Improvements in

BRASS, COPPER, ZINC, AND IRON SASHES,

CAST IRON SHOP FRONTS, STALL PLATES FOR DITTO, AND NAME TABLETS FOR OFFICES, COPPER WINDOW-FRAMES FOR GOTHIC MANSIONS; LIFTS FOR BANKS, WAREHOUSES, &c. STEAM ENGINES AND MACHINERY OF ALL KINDS.

WORKS, DEPTFORD, KENT; LONDON OFFICE, 17, QUEEN-STREET, CITY; GLASGOW OFFICE, 199, BUCHANAN-STREET.

REDUCTION IN PRICE

OF

CLARK'S

NEW PATENT REVOLVING SHUTTERS,

FOR

SHOP FRONTS AND PRIVATE HOUSES.

THE MOST SIMPLE, LIGHT, SECURE, AND CHEAP SHUTTER EXTANT.

Wood Revolving Shutters	2s. per foot super.	
Iron do. do.	2s. 6d.	do.
Steel do. Fire and Thief Proof..	3s. 6d.	do.

BRASS SASH-BARS, STALL-BOARD PLATES, &c. &c.

15, Gate-street, Lincoln's Inn Fields, W.C.
AND 4, MARKET STREET, MANCHESTER.

NOTICE.

MESSRS. SNOXELL,

OWING TO A RETIREMENT IN THE FIRM, AND THE INTRODUCTION OF IMPROVED MACHINERY, NOW MANUFACTURE THEIR

IRON OR WOOD REVOLVING SHUTTERS

AT A MUCH REDUCED PRICE, VIZ.:

WOOD, FROM 2s. 6d. A FOOT, WITHOUT EXTRAS.

REFERENCES GIVEN TO TWELVE YEARS' DAILY USE OF MESSRS. SNOXELL'S SHUTTERS.

BRASS SASH BARS, AND STALL-BOARD PLATES.

PLATES TO ANY DESIGN DRAWN FOR THE TRADE.

35, OLD STREET, E.C., AND 96, REGENT STREET, W.

BY APPOINTMENT.

MESSRS. SNOXELL,

BLIND MAKERS AND TRANSPARENCY PAINTERS TO HER MAJESTY,
96, REGENT STREET, W.

IMPROVED REVOLVING SHUTTERS.

FRANCIS & CO.

Having made GREAT IMPROVEMENTS in the MANUFACTURE of WOOD or IRON REVOLVING SHUTTERS, are enabled to supply the Public at the following REDUCED PRICES:—

WOOD REVOLVING SHUTTERS, with all requisite Gearing complete, from 2s. per Foot. IRON REVOLVING SHUTTERS, with all requisite Gearing complete, from 3s per Foot. Suitable for Banking Houses, Public Buildings, Offices, Shop Fronts, and Private Houses.

BRASS DRAWN SASH-BARS, and BRASS STALL-PLATES, at a Great Reduction in Price.

ILLUSTRATED PROSPECTUSES AND TESTIMONIALS FREE BY POST ON APPLICATION AT 84, GRAY'S INN LANE, HOLBORN, LONDON.

THE FIRST PRIZE THIS YEAR WILL BE "THE DANCING-GIRL REPOSING,"
VALUED AT SEVEN HUNDRED GUINEAS.

ART-UNION OF LONDON,

444, WEST STRAND, W.C.

Instituted 1837. Incorporated 1846.

PLAN FOR THE CURRENT YEAR.

The List is now open, and every Subscriber of ONE GUINEA will receive an IMPRESSION of a PLATE by H. C. Shenton and C. H. Jeans, after T. F. DICKSEE,

"A LABOUR OF LOVE;"

together with a Set of SIXTEEN DESIGNS IN OUTLINE, by P. Priolo, illustrating Alfred Tennyson's Poem,

"Idylls of the King;"

BESIDES A CHANCE OF ONE OF THE PRIZES AT THE ANNUAL DISTRIBUTION,

which will include the original Life-size Statue in Marble, by W. C. Marshall, R.A. of

"THE DANCING-GIRL REPOSING,"

EXHIBITED AT THE INTERNATIONAL EXHIBITION, VALUED AT SEVEN HUNDRED GUINEAS.

also,

BY GRACIOUS PERMISSION OF HER MAJESTY,

PORCELAIN BUSTS OF H. R. H. THE PRINCESS ALEXANDRA OF DENMARK,

reduced expressly and solely for this Society from the original Bust by Mrs. Thornycroft, being the only Portrait in Sculpture for which the Princess has yet sat;

THE RIGHT TO SELECT FOR HIMSELF A VALUABLE WORK OF ART FROM ONE OF THE PUBLIC EXHIBITIONS;
STATUETTES IN BRONZE of "Caractacus," from the Original by J. H. Foley, R.A.;
TAZZAS in commemoration of H.R.H. the late Prince Consort, by J. Leighton, F.S.A.;
STATUETTES IN PORCELAIN, entitled "Go to Sleep," from the Original by J. Durham;
BAS-RELIEFS IN FICTILE IVORY of Subjects from Milton, by E. Wyon and R. Jefferson;
and
BOOKS of ETCHINGS, by E. Radclyffe, after the late David Cox.

The Builder.

VOL. XXI.—No. 1046.

Building and Excavation in Rome.

THE restoration of Roman monuments in style more or less architectonic can scarcely be dated from any period earlier than the present century, anterior to which her rulers and aristocracy were rather bent upon either demolishing or appropriating to their own uses this city's classic remains. About the earliest instance of *improvement*, with view to rescuing from neglect and decay, though not actually to restoring, was the disencumbering of the Colosseum, ordered in 1675 by Clement X. Under the present pontificate the activity in public works of various kinds has surpassed almost all antecedents in Papal story since the energetic reign of Sixtus V.; and the discoveries made have been most important for the light thrown by them both on Pagan and Christian antiquity. Two disinterred basilicas, on the Campagna, have supplied illustration and local church-history; and the extended range of catacombs given to public inspection has added to the most prized records of primitive Christianity. The Servian fortifications discovered in two places on the Aventine Hill, in the Jesuits' Vineyard (1851), and shortly afterwards in the gardens of S. Sabina, the Dominican Convent, have confirmed the conjectures of well-known writers as to their plans and extent; as also the remarkable fragment of massive stone walls, found on the north-western slope of the Palatine in 1847, has corroborated the tradition of the "Roma Quadrata," most ancient nucleus of the metropolis subsequently extended over the Seven Hills; while the immense constructions in lithoid tufo and travertine, brought to light under S. Clemente in works still progressing at that church on the Cœlian, may be assumed to supply sanction for the more vague theories respecting cities on these renowned hills in an ante-Roman and even pre-historic period. With an exchequer reduced to about one-fifth its former amount of annual receipts, the present government has seldom allowed any suspense of undertakings aiming at public benefit or antiquarian research. Pius IX. has never wanted the king-becoming virtue of open-handed generosity or munificence in the promotion of artistic or charitable objects; and it is reported in trustworthy quarters that for gifts to sovereigns or other favoured persons he has spent more than 60,000 scudi (about 330,000 francs) on pictures, sculptures, bronzes, mosaics, engravings, in great part commissioned expressly, besides about 50,000 scudi on sacred vessels and ornaments for churches. Besides utilitarian advantages first secured to Rome under his rule—gas-illumination, railways, a suspension-bridge over the Tiber, restorations of gateways and walls,—are to be recorded the more decorative works for public monuments, and the repair of fountains, to whose amazing number—no fewer than 660—in this well-watered city, has been added another, with Ionic columns and entablature, on the newly-opened Piazza Pia, between the St. Angelo Bridge and St. Peter's. The injury done to the fortifications on the Trastevere side by the siege of '49 has been effaced by the renewal of the towered gateway, Porta S. Pancrazio, and a considerable extent of bastions on both sides; and the more ancient line of walls under the Pincian Gardens has been in part rebuilt, to supply stronger buttresses to the terrace-walks of that favourite promenade, fortunately without sacrificing that curious remnant of overhanging walls, the Muro Storto, still in exactly the same condition as they are described by Procopius, and were superstitiously revered by the populace during the Gothic siege in the sixth century. Another gateway now being rebuilt is the Porta Pia, on the Nomentan Way, originally raised by Michelangelo, and first repaired about ten years ago, after injury by lightning; now to present an imposing front, with travertine columns on the outer side, and to be adorned by statues of St. Alexander and St. Agnes, because through this gate we pass to the extramural churches of those saints. At S. Maria Maggiore is being constructed a splendid confessional, or elliptical chamber, with steps leading to the chapel under the high altar, by arrangement similar to that at St. Peter's; and as this chapel, hitherto visited with difficulty by torchlight, contains sculptures of the fifteenth century that deserve to be seen, more objects than one will be obtained by the new disposal of the superb sanctuary. It is rumoured that here, within the ellipse before the altar, Pius IX. desires his own monument should find distinguished place.

Among antiquarian undertakings under this pontificate, first in order was that for the disencumbering of the half-buried sepulchres on the Appian Way, begun, under Cavina's direction, in 1850; next was the discovery of the Julian Basilica in the Forum; and a few years afterwards commenced, under superintendence of Visconti, the works still in progress for the disinterment of Ostia, great parts of whose streets and temples have been brought to light, like another Pompeii, after ages of oblivion; and there are few scenes so impressive in this vicinity as that now presented by the partially unburied city amidst the mournful desolation, not without its sad and romantic beauty, of that fever-stricken region. At the meetings of the Pontific Archæologic Institute, Visconti has been, from time to time, reporting on all the more noticeable fragments, epigraphs, and statuary dug up at Ostia, whence several portrait-busts of value have been transferred to the Vatican. In Rome has been found another large Columbarium, still retaining its urns and epigraphs, near the Porta Latina, and therefore not far from the two already open, remarkable for their preservation and monumental contents untouched. Besides undertakings in the metropolis and on its Campagna, works for restoration of the antique in other districts and provincial towns, have been numerous and well suggested in the period we are considering: for more completely isolating the Arch of Trajan at Benevento; for repairing the Temple of Clitumnus, near Spoleto; and the mausoleum-chapel of Galla Placidia at Ravenna; also for some requisite repairs to the ancient walls of Cori (which Gell supposes to be Pelasgic), and to the beautiful Doric Temple, dedicated, according to some authorities, to Hercules—others assume to Castor and Pollux,—that crowns the steep height on which Cori stands, above the valley of the Pontine Marshes. But sacred monuments and antiquities have engrossed the cares of authority and received new features of interest, much rather than those of different character, within this period. In 1854 occurred the discovery of the Basilica and Tomb of St. Alexander, on the Nomentan Way; and shortly afterwards that of St. Stephen's Basilica, alike completely hidden by the rising of the Campagna level, and for centuries forgotten save by the learned; the latter a church of the fifth century, founded by Leo "the Great." In November, 1854, was inaugurated the Christian Museum at the Lateran, filled with sculptured sarcophagi, epigraphs, and paintings (the latter copies) from the Catacombs, judiciously selected out of the most valuable in that range of antiques. Since the end of the sixteenth century the "Congregation of Indulgences and Relics" had been charged with the special care and vigilance over Rome's Catacombs, but they have been in later years watched over, and all excavations in them directed by the Committee of Sacred Archæology. For visiting the most interesting and easily accessible of these hypogees, tickets are given gratuitously to all applicants,* at the office of the Cardinal Vicar's secretary. The Roman catacombs may be subdivided into sixty, extending their corridors and chapels for about 900 miles, in different stories, under the soil of the Campagna, and supposed to have received the bodies of about seven millions of Christian dead. Their use for devotional purposes continued common till the ninth century; but the practice of frequenting them had not, it seems, entirely ceased even in the first years of the thirteenth century. Between 1592 and 1623 much activity was applied to their exploration, after the revival of interest in archæologic pursuits of the sacred sphere; but comparatively few of these subterraneans were known between the Mediæval and this later period, till the discoveries made by the indefatigable Bosio (deceased 1600), who spent more than thirty years in the studies and researches by which he rendered much service to Christian archæology. Since his time no one has effected so much for extending the range of permeable catacombs as the Chev. di Rossi, who, a few years ago, found the entrance to the principal ramification of those of St. Calixtus on the Appian Way, among the most important and rich in art-decoration, with oratories containing the tombs of Sixtus II., Urban II., Eusebius, and other Roman bishops; also that of St. Cecilia, a very curious picture of whom, on a wall in the same chapel, has been copied, besides other paintings in these catacombs, for the Christian Museum at the Lateran.

The now nearly complete basilica of St. Paul is the most splendid example of the munificence with which, spite of public disasters and financial embarrassments, the restoring and embellishing of churches have been effected under this Pontificate; and if we cannot often admire the taste, we must commend the generosity and enterprise displayed in this range of public works at Rome. In response to the circular of Leo XII., 1824, was soon contributed the amount of 1,600,000 francs from other European countries: a Protestant king (of Holland) advanced 50,000 francs; a Moslem prince sent enormous blocks of Oriental alabaster; but subsequently the costs have been defrayed mainly by the Papal treasury, out of which were assigned from the beginning 50,000 scudi per annum for the new edifice; and between 1825—37 had been spent on it 720,000 scudi; 400 labourers being daily employed during that first stage of the undertaking. An anomalous campanile at the eastern end (instead of being, like the ancient one, beside the western façade), has absorbed 120,000 scudi; and for the façades, only just begun, Pius IX. has presented 30,000 scudi out of his private purse, principally towards the costs of a great mosaic, from a design by Agricola, to adorn the upper part. The antique mosaics were fortunately, the greater part, saved

* In the present Pontificate, the visiting of the Catacombs has become admitted into the recognized range of "sight-seeing" at Rome by the whole tourist-public, as never the case formerly. Those for which orders are promptly given are the Catacombs of St. Agnes, on the Nomentan; of St. Calixtus (in the interesting ramification recently re-opened), on the Appian Way; of SS. Nereus and Achilleus, entered near to the former; and St. Alexander, below the exhumed church of that Pope. Others, far less interesting, that may be seen without order, are those of St. Sebastian and St. Pancrace, each entered from below the extramural churches of the same dedication, and where the escort of a friar from the adjacent convent is sufficient.

from the flames, though it has been necessary to alter their disposal over the interior walls. As to the exterior, the architects, Belli & Poletti, will assuredly find little mercy from the criticism of future ages for having, with almost unlimited means, erected an edifice quite below mediocrity, and with all its colossal pretensions, utterly meaningless, paltry to the last degree. Yet there is a regal grandeur in this vast interior that, at the first impression, astonishes and carries away the mind, subdued before that long-drawn perspective and extraordinary accumulation of splendours, however much we must condemn, in calm judgment, such anomalies as the modern Italian baldacchino, on immense alabaster columns, *above* that much smaller Gothic one, of the thirteenth century (a detail saved from the fire), which immediately overshadows the high altar; and the large frescoes along the attics, the lives of the two chief Apostles, by different Roman artists, are, generally speaking, of discordant effect, their tone glaring, their composition deficient in that elevated purity and repose which we admire in the modern sacred art of the Germans. Not a single work by Overbeck or Cornelius adorns this or any other Roman church; though sculptors of highest repute, as Tenerani, Rinaldi, Jacometti, have here contributed, and the St. Benedict, by the first of these, a seated colossal figure over the altar of a beautiful side chapel, is full of patriarchal dignity. The prescription of Leo XII., that the head should be essentially a reproduction of the ancient St. Paul's, has not been consistently observed; in the exterior, indeed, manifestly violated. Its present reality supplies proof how little Rome's artists are influenced by the high and pure type still presented by so many examples in this city, of the Early Romanesque basilica, the only characteristic and nobly religious architecture Rome ever produced under Christianity; and we might appeal to any capable of feeling, whether such temples as S. Sabine, S. Agnese, and S. Lorenzo, beyond the walls, be not far more elevating, and in their majestic simplicity more satisfying than all the overcharged magnificence of the new St. Paul's? The above-named S. Agnese, on the Nomentan Way, is another instance of restoration, with much rich embellishment, carried out under the present Pontiff. Its leading and very graceful features are still those of the original building raised by Honorius I. (625-38), and that olden architecture has been happily preserved intact, though a polychrome decoration, to imitate inlaid marbles, was carried along the spandrils and above the curves of the arches in the nave, medallion heads of Popes, benefactors to this church, interspersed over the same surface, and figures of the Virgin Martyrs painted along the attic above the double colonnade, when the whole was renovated, and the adjacent monastery rebuilt in 1856.

ON THE ARCH AND ARCADES.

PROFESSOR SMIRKE'S CONCLUDING LECTURE AT THE ROYAL ACADEMY.

I THINK it may fairly be said that most of man's greatest discoveries have been the result, humanly speaking, of accident. The manufacture of glass, and gunpowder, the discovery of the magnetic needle, and of the steam engine, are striking, although perhaps somewhat trite, illustrations of this truth. Indeed, the history of science is full of examples of what may be, in some sense, regarded as the *fortuitous* origin not only of the great inventions of human ingenuity, but of many of the subordinate improvements and accessories in art and science. It is not my purpose, however, on the present occasion to expatiate on this wide field of inquiry, or to consider with what propriety the process of the human mind by which it observes, and applies, and appropriates the suggestions offered by external objects, *can* be termed *accidental*.

My only reason for adverting to it is to introduce to your notice a very early and important discovery in the art of construction; a discovery, indeed, which led the way to some of the most important revolutions which have ever influenced the practice of architectural art. I refer to the discovery of the *arch*. I believe that this discovery may really, with great probability, be attributed to accident. This idea forcibly struck me when examining the remains of Pelasgic art in Etruria. We there see no traces of the use of the arch, it is true; but we see in the peculiar masonry of that early period what I cannot but believe to have been the germ of the arch; namely, that fortuitous fitting together of several stones which would admit of the removal of some of them without causing the disturbance of the rest. The pains-taking masons of that period could not have been long without perceiving the convenience resulting from this peculiar collocation to which I refer, and which is the special characteristic of the masonry of the Pelasgi, who are assumed to be the earliest civilized inhabitants of Italy.

I may add in corroboration of this conjecture, that in one of the early vestiges of ancient Rome, namely, the Emmissario at the Lago d'Albano, is a flat arch, such as is technically called a skeme arch, which is just the kind of arch that would naturally suggest itself as one of the first applications of the principle. I must not, however, detain you many minutes on this subject: it is too archæological to be suitable for our consideration here. In thus suggesting the possibility that the arch may have had its origin among the Etruscan masons, on observing the facilities occasionally offered by the collocation of stones in their *opus incertum*, I fear that I cannot claim for them the *exclusive* merit of the discovery; for there is no fact more certain than that arches were used by builders so widely separated from *them* and from each other, both by *time* and *space*, that we cannot reasonably suppose that one borrowed from the other, or that there was any interchange of knowledge.

Sir Gardner Wilkinson tells us of arches in *Egyptian* masonry, to which he considers himself justified in attributing the early date of 1200 B.C. We have, too, brought under our own eyes, in the British Museum, bas-reliefs carved with beautiful precision and in perfect preservation, the representations of walled cities, in which arched-headed doorways repeatedly occur. The date attributable to these examples is, according to our best authorities, the seventh or eighth century B.C. I am informed that quite recently certain excavations made by one of the religious societies, in a vineyard on the Aventine Hill, in Rome, have brought to light well-preserved portions of the ramparts attributed to the regal period of Roman history, composed of excellent masonry; and a perfectly well-constructed semicircular arch has been exposed to view. The antiquaries of Rome regard with confidence this arch as the work of S. Tullius, 578 B.C. The Cloaca Maxima, whose arched entrance into the Tiber is familiar to most who have visited Rome, is by common consent pointed to as the work of Ancus Martius, 640 B.C.; and this is a semicircular arch turned with excellently cut stone voussoirs. It is, therefore, impossible to deny the extreme antiquity of the arch; but what we may feel justified in saying is, that it has been an invention of slow growth; *i. e.* one of which the advantages and wide application were not at once and generally appreciated: nor were the æsthetic and constructive merits of the form marked by any very early recognition. That the Greeks did *not* use the arch is a pretty generally admitted fact: the absence of any indication of it in any remains of pure Greek work is sufficiently strong negative evidence; and the stratagems that we find the builders of that period resorting to in order to overcome difficulties which the arch at once effectually overcomes afford strong collateral proof. I would call attention, for instance, to the construction of masonry over an opening at one end of the Temple of Concord at Agrigentum, in Sicily. The courses sail over on either side of the opening with a view to diminish the bearing of its straight, flat lintel, whilst the ordinary relieving-arch would have answered the purpose so much more effectually.

However, it is certain that, whatever may have been the cause, whether ignorance or the force of habit, for a very long time indeed the value of the arch was not duly appreciated. Nor, perhaps, have we any right to taunt the builders of antiquity with the slowness of their apprehension. Even in our own age of science and civilization, and with all our modern means of interchange of knowledge, a hundred years or more passed between the first discovery of the mechanical power of steam and the full recognition of its utility.

We may regard it, I think, as pretty well agreed that architecture had not appropriated the arch as one of her important features until two or three hundred years before the Christian era. We find it in familiar use during the existence of the Roman republic; and, when once generally adopted, one of the most complete revolutions in the whole history of our art was effected. The whole character of Roman architecture under the emperors seems *influenced by the arch*. The great works of the Pantheon, the Colosseum, and indeed nearly all the great monuments of that age owe much of their character to this system of construction. It is probable that not æsthetic considerations alone, but motives of a practical nature, may have had much influence in favouring the use of the arch. The transport of large, heavy blocks must have at all times taxed the mechanical ingenuity as well as the pecuniary resources of builders. Even at the present day the cost of a stone increases with its size in a compound ratio: how much more so must this have been the case in the early times of which we are treating, when roads and canals scarcely existed? We may then well understand that a system of construction which not only admitted of, but which almost demanded, the use of stones of moderate size, was peculiarly welcome to the builder, and invited his adoption. How rejoiced, too, must have been the architect, to resort to a mode of construction by which not only *cost*, but *time*, was saved, and his boldest designs, his grandest ideas, might be realised in the least possible time. He had no longer to drag, perhaps from a remote distance, his cumbrous blocks of many tons weight, over a trackless country, and then to rear them, tediously and expensively, by the agency of a multitude of labourers. The nearest quarry would now probably be such as to furnish him with stones quite large enough wherewith to turn his arches, however gigantic their span.

Nor was he any longer compelled to select exclusively the hardest and strongest stones for his building: the pressure of weight upon the wedge-shaped voussoirs of an arch is to be measured by the *crushing* power of that weight, whereas the effect of the same weight bearing perpendicularly on a horizontal beam of stone would be much more effectual in fracturing and destroying it.

We see, too, how speedily the Roman builders found that an arch specially favoured the use of *bricks*. The more *ancient* types of temple architecture seem almost necessarily to exclude, in great measure, the use of bricks; whereas an arcuated construction was carried out in every way more advantageously with bricks than with stones.

We may consider, therefore, that it is to the ready applicability of bricks to arch-building, that we owe the existence of the stupendous Colosseum, the Temple of Peace, and others of Rome's proudest monuments.

I may here remark the fact that all the great distinctions of style in our art are traceable, not so much to the genius of the designers as to the *circumstances* of the *time* and the *place*.

How differently would the Egyptians have built had they not had granite and stone quarries available! How different an expression would have distinguished Greek art had Greece been an alluvial country affording bricks only instead of stone and marble! How differently would the Romans have built had they been acquainted with the economic uses of wrought and cast iron!

Were I disposed to encourage the search after a *new style* (a search which I am very far indeed from encouraging you to prosecute), I would say to you, seek it in the application of some *material*, or in the invention of some new *system of construction*; for truly it is in our own art as it is in the fabric of the human body; the general aspect of every animal depends for its varieties of form far more on the structure of the skeleton than on the superficial integuments with which its exterior is clothed.

I revert now to the state of our art, when the arch had acquired that influence which it never afterwards ceased to exercise.

I suppose that we may regard the Tabularium, on the Capitoline Hill, as the earliest, well authenticated, example of a regular *arcade*. An inscription exists to this day which tell us that it was built by Q. Luctatius Catulus, who was consul, A.U.C. 676, a hundred years therefore before our era.

After this date examples become much more frequent. I believe I am justified in saying that the earliest surviving example of the superposition of one arcade upon another is the Theatre of Marcellus, built by Augustus. There was but a step between this system of construction and that which was perfected in that stupendous pile, the Colosseum.

I have, in a lecture which I had the honour to deliver last year, pointed out the deep and durable effect on architectural design that must have been produced on all subsequent time by that marvel of art. When we remember that this building was the great centre of attraction in the pleasure-loving capital of the world; the eager resort of a countless population, whose cry was ever "*Panem et circenses!*" such a building would almost necessarily be the object, *first*, of admiration, and then of imitation. Hence we find the arcaded corridors of the Colosseum repeated in various

parts of the wide-spread Roman empire, thus exercising a powerful influence on the architecture of the whole civilized world. The accomplished artists of Rome were not slow to perceive that, besides the opportunities for rich ornamentation which this union of the arched and columnar principle afforded, and the pleasing variety of effect obtained by this combination of straight and curved forms, there were practical benefits resulting from it: the far wider span that could be given to the *arches* than it would be possible to give to an *intercolumniation*, was an important advantage in a great public building resorted to by the teeming population of Rome; whilst the three-quarter columns, bonded in as they were, so as to form an integral part of the piers of the arcade, became a source of great additional stability to the structure, acting, in truth, exactly as the buttresses in Mediæval work.

It would be out of place *here* to dwell upon the magnificent masonry of this wonderful building; but I would remark that the Roman builders, however deficient they may have been in the higher efforts of genius, were certainly most remarkable for uniting a strong artistic feeling with a knowledge of construction that might well put to shame the puny efforts of modern masons, whose ingenuity generally exhausts itself on ignoble endeavours to pare down their work to the minimum of substance, and to ascertain what is the greatest tenuity that may be given to their walls so that they may just stand—and no more. Certainly, had such penurious calculations influenced the great masters of Roman art, we should not now, at the end of eighteen centuries, be contemplating the gigantic remains that still survive to surprise and instruct us.

It was said by one of the most eminent engineers of the last century, Mr. Mylne, that he derived more practical benefit from the careful study of the masonry of ancient Rome than from any other professional object of his attention on the Continent. With reference, however, to the combination of arches and columns, I am not prepared altogether to defend the union of these two modes of support on the ground of any great propriety there may be in that union. The arches, or the columns, ought perhaps each to suffice for the purpose of carrying the superincumbent weight, without the aid of the other. In the case, for example, of the triumphal arch of Severus at Rome, and the numerous similar structures to which the patriotism of the Romans, and their love of military glory, gave birth, the coupled pillars on either side of the arch seem superadded for no purpose whatever beyond mere embellishment. Critics may differ as to whether that is a sufficient justification. It is a wide question how far an architect is to be permitted to avail himself of forms of no real utility for the sake of their æsthetic merits. I have already, on a former occasion, sufficiently discussed that question; and the result which I,—perhaps I may say, *we*,—came to was, that pure and excellent as is the principle that utility should be at the foundation of all architectural design, a too literal acceptance of that principle would lead to the abandonment of much of that pleasure which we derive from the contemplation of abstract beauty: it would deprive the pinnacle of its crockets and the frieze of its foliage. Such considerations incline me to justify the ancient artists in that pleasing combination of arches and columns which became afterwards so rich a source of beauty, when the cinque-centists came to found on the antique type their own essentially new style.

The arch having now become the form most favoured by Roman architects, we find it entering into the construction of all their most important works, both public and private. An arcaded cloister forms the most marked feature in the beautiful building at Tivoli, known as Mæcenas's villa, but attributed by some antiquaries to a date somewhat later than the lifetime of that patron of art. Arches also form the essential feature of the Temple of Peace, the magnitude of which arches may be understood by considering that the span of each arch or vault is about the width of Regent-street, and is in height up to the crown of the vault something more than the height of the York column.

We have not time, were it expedient, to follow the history of this form through the period of the decadence: the palaces of Caracalla and Diocletian present many magnificent examples of it, and a peculiar character is given to the early Christian basilicas by its almost constant use. An arcade completely surrounded the multangular tomb of Theodoric. The architecture, indeed, of the Bassi Tempi is especially characterised by these arcades, although reduced, it is true, to very insignificant dimensions. The façades of perhaps all the churches of that period were usually covered with them; and it is curious to observe how direct the descent is from these arcaded, Romanesque façades down to the west fronts of our Chichester and Lichfield cathedrals. All art is generative. We begin by simply repeating what we have seen and learnt to admire or revere; but the active mind of man is not content to stop there: it goes on to vary and modify and amplify. New ideas will supervene; new resources of art arise: thus great changes are made, and wide departures suggest themselves, till the original type remains uneffaced, and the parent idea—the arcade, the dome, the spire—is handed down in a numerous and diversified progeny.

Hastening now on to the Early Renaissance, I do not call to mind any surviving building of that date wherein *columns*, if introduced at all, do not play a very subordinate part as compared with *arches*. It is true that Alberti, writing about the middle of the fifteenth century, does lay down some not very definite rules for the *Orders*, such as he found taught by Vitruvius, whose treatise, although then but little studied, was beginning to receive that attention which was afterwards even *too* lavishly bestowed upon it. Nevertheless, it is very certain that the early masters of the Revival sought for architectural effect, not from stately colonnades, but from variety of outline in their masses produced by the infinite diversity of graceful forms afforded by the arch.

If you examine the pictures and frescoes of that early period to which I advert, you will find the painters perpetually revelling in the graces of the arch. Arcades of infinite variety and originality occur in the works of P. Perugino, Alberti, Albert Durer, and others.

But the *architecture of painters* is a subject too pregnant and important to be treated on incidentally or slightly; and I shall, therefore, reserve that subject for a future occasion.

I have now detained you at perhaps more than sufficient length on the historical view of my subject; but all history, remember, is a treasury of useful lessons. The politician is ill prepared for his task of advising how a country is to be ruled if he be not thoroughly well informed how, under various circumstances and at former periods, other countries have been ruled, and with what results; and so the young architect will find himself unequal to cope with the difficulties, or to win in the contests which await him in his future professional career, unless he shall have learnt how his predecessors have contended with and overcome like difficulties. Reynolds goes so far as to predict that, "when the great masters of past times shall cease to be studied, the arts will no longer flourish, and we shall again relapse into barbarism."

It is an undoubted truth that the artist, whatever may be the branch of art he would cultivate, must take these retrospective, general views, if he desires to be well informed in his art. A man who is in search of the *right path* must needs scan well the country around him, far and wide, in order to find it.

My special purpose on this occasion is, as I have told you, to confine your attention to the subject of the *arcade*. I trust I may say, honestly and without risking the charge of conceit, that I feel somewhat of kin to enthusiasm on this subject. In the earlier days of my studies, when I first viewed the noble works which time has spared us on the Continent, nothing attracted a more eager attention, nothing impressed me more deeply, than the beauty of those arcades which, in endless variety, offer themselves to our admiration in that land of art, Italy. It is far from my purpose, or wish, to depreciate the beauty of columnar architecture: the cortile of St. Peter's and the façade of the Louvre are evidence of the noble effects attainable by a simple colonnade: yet it cannot, I think, be denied that the *arcade* has in many respect an advantage over the colonnade: there is more variety of outline in the former; a broader chiar'scuro; perhaps a greater scope for ornamentation; for whilst both alike may present cornices, friezes, and shafts, upon which ornament may be lavished to any extent, the arcade *alone* affords a peculiarly favourable field for the ornamentist in its springing stones, keystones, archivolts, and spandrils. But besides these purely *æsthetic* considerations, there is another point of view in which the arcade may be looked upon with favour. It is obvious that the arcade, and the vault, offer a system of construction which leaves the space they occupy freer, and more unencumbered than any other, not only because the use of the arch permits the points of support to be wider apart, but also because, as I think may be easily shown, the points of support themselves may, *cæteris paribus*, be made, in respect to their area, or horizontal section, smaller in the case of an arcade than in that of a colonnade. The reason is this: when the whole height of the aperture, or series of apertures, in a wall is *given*, the length of the shafts which support an arcade will necessarily be less than their length when they are charged with a horizontal entablature, *by the radius of the arches supported*.

The *stability* of a pillar or shaft, or of any upright support, is, in the language of mathematics, *directly* as their diameter, or horizontal section, and *inversely* as their height or length. Therefore, in order to support any given pressure, whether it be that of an arch or of a horizontal entablature, the *less the height, the less* may be the area of the section of the pillars.

This is no scientific delusion, but an exact, certain, mathematical truth, a truth which may be recognised in the general adoption of the arch, whenever circumstances render it expedient to occupy as little space as possible by the supports. Thus it led to the substitution of arches instead of columns in the Christian Basilicas, for the internal supports of their roofs; and the recognition of this truth no doubt led to the ultimately universal adoption of arches instead of columns for the interior supports of Mediæval churches. It is true that the *wider* the *arch*, the *larger must be the section of the piers* which carry it; but then the diminished length (or height) of the piers compensates for this, and the result is that an equal burthen is borne by less bulky supports when arches are used instead of columns. I fear that in this disquisition about the size of piers I may have been led away into details somewhat too technical; forgetful that within these walls we are limited to the consideration of architecture as a *fine art*; but unfortunately, in architecture, science and art are so intimately blended, or rather so indissolubly connected, that it is sometimes apparently impossible to skim over the surface of one without dipping our wings slightly into the other.

One of the most beautiful applications of the arcade is in the *cloisters of the middle ages*; originating, I presume, in the impluvium, or, perhaps, in the crypto-porticus of the Roman villa. The cloistered court became, in very early Christian times, appropriated as the atrium or fore-court of the Basilica, an interesting example of which survives at the Basilica of S. Ambrogio, in Milan. This cloistered court, so well adapted to the solitary and contemplative habits of monastic life, soon became an essential feature in every monastery, and we find even that *two* such secluded courts were not unusual. At first, probably, mere sheds of wooden construction, they ultimately became objects on which the builders of old loved to display all their power. Even as early as the tenth century, a portion of a cloister which exists at Puys de Vélay, in France, shows much elaborate masonry. The Campo Santo, of Pisa, is a highly interesting and very well preserved example of an arcuated cloister of the thirteenth century, which, although now open, appears formerly to have been glazed, no doubt with a view to protect the frescoes and monuments with which the interior was so richly decorated.

This glazing was a luxury unknown in earlier cloisters, and seems to have been a natural consequence of the growth of tracery.

I must not, however, dwell on this subject of cloisters: the examples are too numerous to render it expedient for me to present them to your notice here. Yet they well deserve your careful study, as being one among the most beautiful of the applications of this principle of construction.

In *civil* architecture, the builders of the Middle Ages were not slow to avail themselves of the arcade. The front of the doge's palace towards the piazzetta, Venice, presents an example of singular beauty; and suggested, probably, those smaller glazed arcades which became one of the favourite modes of enriching the façades of the palazzi in that city during the fourteenth and fifteenth centuries. To the former century is due, also, the noble arcade so well known as the Loggia dei Lanzi, in the principal piazza in Florence. This most original work marks an epoch in the history of our art; for we recognize in it the commencement of the change which took place so early in Italy, and which heralded the return to the ancient types. Michelangelo is reported by Vasari to have so enthusiastically admired this work by Andrea Orgagna that, when a general improvement of the piazza in which it stands was contemplated, he declared that the most perfect mode of ornamenting it that he could devise would

✠

be to continue this noble arcade around all the four sides of the square; and I think there can be no doubt that, had Michelangelo's conception been realized, one of the most magnificent architectural scenes in the world would have been the result. Some idea of the grandeur of this arcade may be formed by picturing to the mind an arcade considerably higher than Somerset House, consisting of a single range of arches 45 feet high from the pavement to the crown of the arch.

The Campo Santos at Ferrara, Bologna, and Milan, are examples of arcades very remarkable for their extent; and, in the case of the latter example, especially worthy of study as an evidence of the applicability of terra-cotta to the purposes of architectural ornamentation. It is in the style of the earliest Renaissance, and overladen with a superabundance of the most intricate decoration, executed wholely in brickwork, and designed in a quaint and original, but very effective manner.

Those only who have endeavoured to execute buildings with bricks of moulded terra-cotta can fully appreciate the masterly dexterity with which this most elaborate piece of work is carried out; a dexterity which is immeasurably beyond even the remotest *conception* of a London bricklayer.

When the practical difficulty of moulding and casting in mere brick earth minute enrichments with the sharpness and force we here see,—the difficulty, too, of building up and bonding together this multitude of details so closely and solidly that at the end of four hundred years the work should still stand in excellent preservation—with these facts before us, we are constrained to admit that our artisans have a very great deal to learn before they can come up to the level of their ancestors.

The other two cemeteries I have named are also noble arcaded areas, offering valuable suggestions for similar structures in this country; inasmuch as these covered avenues, while they afford a well-protected walk, offer most favourable positions for sculpture and for inscribed memorials.

A uniform, symmetrical arrangement of this nature would surely be better than the chaotic confusion of heterogeneous monuments which our open cemeteries usually present.

It would occupy a great deal too much of our time were I to attempt to enumerate even the most conspicuous examples of this popular and pleasing feature, the *arcade*. Italy abounds in them. The city of Bologna, more than any other city in Europe, or perhaps in the world, is rendered remarkable by them: you may traverse that large city in most directions wholly under their cover; but perhaps one of the most singular arcades in existence is that which extends for upwards of two miles from one of the city gates up to a church built on the summit of a height overlooking the city. This arcade was built by the inhabitants in honour of the church to which it leads, and for the public use and benefit, at their own cost, each citizen contributing an arch.

I am tempted here to ask why so remarkable an instance of the benefit resulting from a combined action in such matters should not suggest the erection of some similar arcade encompassing, or traversing, one of our own parks? Such a cloister would be a work of signal public utility in a climate such as ours.

Now, with regard to the relative proportions which should be given to an arcade, it does not appear to me that any rule can be laid down rigorously on the subject. Much depends, perhaps I might say *all* must depend, on the circumstances of each case. Independently of every consideration of *style*, the *nature* and *position* of the building would have to be consulted before we could determine whether an elegant lightness or a grandiose stability should characterize it; and this applies equally to the arches themselves, and to the piers from which they spring.

The utmost diversity prevails among even the finest examples; and, in truth, it is the facility with which the arcade lends itself to every purpose of our art which is one of the good qualities especially recommending it to the architect. We have had to vary the proportions of the pier to the arch, and we have at our command the widest extremes of effect. There are *pedants* in all pursuits, whether in letters or in art; and our art has, perhaps, more than the sister arts, been the victim of those narrow views which pedantry engenders. We have had our rules laid down for us with a precision that would lead us to infer that there must be some arithmetical gauge by which we may test all the most subtle questions of taste in art. Thus Milizia determines for us that an arch 12 modules wide should never be *less* than 23 modules, nor *more* than 26 modules in height; and with respect to the piers which support them, that their width should never be more than one-half nor less than two-fifths of the span of the arch. There perhaps may be some use in arbitrary or empirical rules of this nature as helps to the student, but they must ever be regarded as mere rough approximations, subject to so many modifications according to circumstances as to render such rules of very limited application. For instance, some of the most pleasing examples of Italian arcades that I can call to mind have their arches springing from single or coupled columns. It is obvious that Milizia's rules are wholly inapplicable in such cases: it is also obvious that, in determining the proportion that the arch and pier should bear towards each other, it is most important to regard the weight and bulk of the superstructure. To an arcade that has but its own weight to carry, a degree of lightness and airiness may be given which would be quite inappropriate when a heavy building surmounts the arcade.

It would be in vain to argue that by the use of marble, or granite, or, perhaps, iron, the slenderest supports may be rendered adequate to bear even the loftiest and heaviest structures: the *prejudices* of the eye must be consulted if we would wish to please it.

There is but one other detail to which I need now refer; namely, the manner in which the arch is made to bear upon the piers or pillars which receive it. This appears always to have been regarded as a difficulty, demanding the exercise of more or less ingenuity, especially when the arches sprang from columns. The earliest idea was to make the arches spring from imposts consisting of so many fractional parts of the ordinary continuous entablature of a columnar order. This is, of course, a very easy contrivance, inasmuch as it involves little effort: the portion of the entablature between each column had but to be removed and an arch substituted. Yet this easy arrangement had its obvious objections: a *stilted*, *unstable* effect is produced, and the cornice returning round over each column has a top-heavy appearance: in fact, it converts this part of the entablature into a sort of overloaded capital of clumsy shape.

This defect became effectually remedied by the total omission of the entablature and by making the arch spring directly from the capital of the column. Examples of this occur so early as Diocletian's Palace, in Dalmatia; and many other instances of the period of the Bassi Tempi. But the incongruity of the square archivolt resting on the circular shaft became soon apparent to the Early Mediæval masons, who struggled to invent some intermediate course. Hence arose the use of those blocks which we see on the capitals of columns in the Lombardic and Byzantine schools. These rude devices are not without merit and originality, and were, at all events, good and sensible pieces of masonic construction. All, however, were abandoned when the facile hand of the Gothic freemason had learnt to overcome the difficulty by a variety of more or less effective contrivances.

At length all further embarrassment was removed by the total omission of an impost or capital, and the archivolt mouldings were continued, and the archivolt mouldings were continued, uninterrupted by any impost whatever, to mark the springing of the curve.

I have addressed to you these somewhat miscellaneous and imperfect notices of the arcade, its history and its construction, and its æsthetic merits, with a view to invite your attention to what I consider one of the most fruitful sources of beauty that our art commands. I would have you study with diligence and with becoming respect the glorious examples that have been bequeathed to us by our predecessors; for I am not of those who seek to despise or repudiate the authority of *precedent*, and who thus set at nought the experience of ages. The self-satisfied who find their vanity gratified by vaunting the superiority of the present over the past—of their own pre-eminence over their forefathers—are precisely the men who do most to check improvement and impede real progress. Yet I would, with equal earnestness, deprecate that blind and unreasoning *subjection* to precedent—that blank and ignoble perverseness that raises up any given style or any given period into an object of idolatrous worship, at the foot of which every votary of art must bend the knee and prostrate his own judgment. All such narrow exclusiveness enfeebles and impoverishes the mind, leading to direct imitation and to a disregard or forgetfulness of the general principles of our art.

It should never be overlooked that, in æsthetic as in other matters, we are reasoning creatures, bound to exercise the judgment with which we are endowed, weak and faulty as it may be, prone to error as it certainly is; yet such as it is we are bound to listen to the promptings of our *reason*, for such in truth is the sole ground on which we can claim superiority over all other of God's creatures. We are taught by the highest authority that has been revealed to us for our guidance, that we should "Prove all things, and hold fast by that which is good." This great dictum was uttered for our spiritual guidance, but it may, I trust, without irreverence, be regarded as teaching *artists* also a lesson. It tells us to make ourselves as thoroughly acquainted as we can be with all that the past has left for our admiration and instruction in art; and with our minds so edified we are to exercise the attributes of reason and judgment in selecting that which is true and good, and rejecting that which, whatever its merits, may appear to us as having become unsuitable or unequal to meet the requirements of the present time.

This doctrine may be stigmatised as eclectic or latitudinarian, and as encouragement to an indulgence in all manner of fantastic excesses. Yet I would reply that into whatever amount of error our ineffectual struggles may lead us, such error would be the result, *not* of any unsoundness in the doctrine, but of our own weak judgment and of our own insufficient intelligence.

Reason and good taste can never be really at variance. If we do *not* take reason for our guidance, to what pyx or star are we to resort for direction? What test in our art have we, if it be not our sense of what is reasonable? Is *tradition* to be the test? Can abstract *science* furnish us with it? Shall *fancy* supply us with the mete-wand with which we are to measure taste in art? Vainly shall we seek to place reliance on any of these insufficient guides.

It appears to me that architects have no alternative but to choose between an entire, blind, and exclusive reliance on precedent and authority; or we must take the dictates of reason as our guide, and endeavour to shape our course under her influence.

Let us then hold fast to that which presents itself to our minds as good and right, allowing no superstitious prejudice to warp our judgment be it *Greek* or *Gothic*; and I think we may rest assured that such a course would afford us the best chance of ultimately, arriving—it may be after a long purgatorial period of folly and excess yet still ultimately, arriving—at a sound, consistent, and original style, worthy of the genius and civilization of the nineteenth century.

In making these remarks in vindication of our right, perhaps I should say,—in enforcement of our duty, to exercise, in the best way we can, that reason which has been beneficently implanted in our minds,—I am very anxious not to be misunderstood as undervaluing that other important duty of studying the works of our great predecessors. I have already urged this duty on you: let me do so again emphatically and with all earnestness.

Has not the text I have ventured to quote told us to "Prove *all* things?" Make yourselves, then, I repeat it, intimately acquainted, not in a desultory, superficial way, but intimately, critically and studiously, with all that our forefathers have done. They have handed down to us treasures which, to disregard, would be to deprive ourselves of the means of acquiring their wealth. It is our great Reynolds who says, with true Johnsonian force, that "Bacon became a great reasoner by first entering into and making himself master of the thoughts of other men."

So also, I sincerely believe that the best possible foundation of originality in design, as much in that art with which I am alone conversant as in the two kindred arts so closely allied to it, is an intimate knowledge of the works of others.

Having in these few words touched upon the subject of the education of an architect, I attempted in closing this my last lecture of the present season, to pursue the subject a few minutes longer.

The nature and extent of the professional education which it behoves an architect to acquire who aims at taking a place among the foremost rank of his fellow labourers, form a large and important question, which has of late excited a deep interest in the profession, and has occupied much of the attention of its elder members; and I can not doubt that on the result of their deliberations may much depend the good or evil destiny of the profession.

But this is not a proper place for dwelling on that momentous question. I must not forget that I am addressing a body of which but a very small portion are architects; and it is therefore necessary that my remarks should apply exclusively to my art in its relation to the sister arts; keeping clear

of those technical inquiries with which our brethren of the other branches of art cannot be expected to sympathize. There is, however, one lesson of which a pretty long experience has taught me the high importance, and which applies with equal force to all the arts of design: I mean the absolute necessity of acquiring the power to *draw* well.

In painting there is, perhaps, no point so emphatically dwelt upon by those who have a right to guide us, as the necessity of acquiring this power; and, in the *sculptor's* art, to draw well must necessarily be of at least equal importance; for in that art *form* may truly be regarded as of paramount consideration.

But I venture to aver that, whatever may be urged on this point by the painter and sculptor, will apply with especial force to architecture.

Truthful representation and a delicate appreciation of form are so essentially a part of an architect's education, that I know of no acquirement in the curriculum of his studies that can take precedence of the power of *drawing*.

I am tempted here to quote the words (*never, I believe, yet quoted*) of perhaps the very highest authority that could be adduced on such a point.

In the very valuable collection of drawings by Michelangelo in the British Museum is an architectural sketch upon a loose sheet of paper, preserved from destruction by the reverence of his zealous scholars, and now stored amongst the most highly-valued of our art-treasures. Upon the margin of this sketch are written, in the well-known handwriting of the great master himself, these words:—"*Desegna, Antonio,—desegna, Antonio,—desegna, e non perd' tempo.*" The Antonio to whom these admonitory words were addressed was probably Antonio Mini, who was a favourite pupil of Michelangelo. Such, at least, has been suggested to me by Mr. Carpenter, in whose able hands these sketches are deposited. The emphatic repetition of the word "*desegna*" unmistakably and forcibly expresses the importance attached by Michelangelo to the necessity of *drawing* well, and it points out with singular force the great master's opinion that unremitting application in the drawing-school is of paramount importance to the artist.

Such application is attended, I need scarcely remark, by other beneficial results besides mere facility of *hand* in the use of the pencil. It is also excellent practice to the *eye*. The power of observing *closely*, and therefore *correctly* and *profitably*, can alone be acquired by those whose eyes are trained by a constant exercise in drawing; and we may add, as the converse of that truth, that he only can draw with correctness who has educated his eyes by constant habit of observation.

In the painter's art, I apprehend that the best safeguard against mannerism is this habitual exercise of the power to see and to represent objects as they really are; and it is almost superfluous to say that in the art of architecture the best security for originality of design is to be found in the acquirement of a full command over the pencil, by which the designer is saved from the tendency to repeat commonplace forms and to follow in a beaten track, and also from the risk of falling into an indulgence in architectural platitudes. My urgent advice, therefore, to all young architects, is that, while the *pen* may well be laid aside as an instrument of very doubtful value in your æsthetic education, and whilst the *tongue* may well be spared its labours, inasmuch as a wonderful volubility of that organ may be found to co-exist with a very slender store of solid knowledge; let your pencil, in the mean time, be ever in your hands; and remember Michelangelo's advice to his favourite pupil, "*Desegna, Antonio; desegna, Antonio!*"

LONDON RAILWAYS.

THE necessity for widening the Metropolitan line between King's-cross and Victoria-street, will present itself, we apprehend, very speedily. A similar necessity must also be felt soon, in the case of the line from the Victoria (Pimlico) Station. The traffic has increased beyond all expectation; and trains of the Great Western Railway will ere long have to be provided for. Indeed, two of the companies at present using the station, have Bills in Parliament for widening the line and increasing the station accommodation. For the northern lines, our readers know, a bridge is being built across the Thames near Cremorne Gardens.

The London, Chatham, and Dover Company have not fixed upon the exact site for a station in the City. Indeed it would appear that this Company propose to bring their line only to Earl-street; and to leave the station, and the line connecting theirs with the Metropolitan Railway, to be constructed by a distinct company. Meanwhile they are seeking to have the time allowed for the completion of their line, extended to the 1st of August, 1867. They have already a line in operation from the Elephant and Castle, through Camberwell, to Herne Hill, and one from the Victoria Station through Clapham and Brixton to the same place. There is a connecting line between these two; and passengers may travel from the Victoria Station to the Elephant and Castle, and eventually, crossing the Thames to the station in or near Farringdon-street, or still further in a northerly direction, in fact to the north and west of England; or may travel in the reverse direction. The two lines, or branches, one from the City and the other from Victoria-street, unite at Herne Hill as already mentioned; and the main line to Dover will continue with a station at the north end of the Crystal Palace, and the one at Beckenham. The Junction between the London, Chatham, and Dover Railway and the Metropolitan, as well as the station, and a connecting line to the new Smithfield Market, form the subject of the Ludgate Station and Junction Railways Bill, promoted by a distinct company. Ludgate-hill is to be spanned by a girder bridge, at a height of 18 feet. Every one seems to regret the prospect of the unmitigated ugliness of such a structure interfering with the view of St. Paul's,—as it is to be feared also may the Thames Bridge with the view from the new Blackfriars Bridge,—yet no one seems to have the will or power to control the proceeding now, further than the City propose in getting power to require that the span of the Ludgate-hill Bridge shall be sufficient to permit of a widening of the street at some future time. The total area scheduled is about 17¼ acres; and it is probable that a large portion of the property at the western end of Ludgate-hill will be taken down.

According to Mr. Heywood's Report (lately presented to the Commissioners of Sewers for the City), from which some of these particulars are taken, the whole area bounded by Eldon-street on the north, London-wall south, Finsbury-pavement west, and Bloomfield-street east, and therefore including Finsbury-circus, and the London institution (but excluding four chapels, and an eye-infirmary), is to be taken for the new Metropolitan Station of the Great Eastern Railway. We have already spoken of the general want of harmony between such undertakings as those of the railways in the metropolis, and the arrangement of the streets. The railways about Finsbury are an illustration of the defective system. The Metropolitan Railway coming to the east side of Finsbury-pavement, will, according to Mr. Heywood, have its level of rails 18 feet 6 inches below the street-level; whilst the Great Eastern Extension will have its level 19 feet above the street. The break, and the ascent or descent of seventy or eighty steps, are very properly commented upon as matters deserving the serious consideration of the City authorities, of the two companies mentioned, and others, and of the Government. The scheme of the Great Eastern Company as it was in 1861, comprised a junction with the Metropolitan Railway; whilst a general station on the site of the circus, was to serve for both railways; and no reason is apparent for the changed intention of the Great Eastern Company. According to Mr. Bazalgette's Report to the Board of Works, this railway will join the North London near Dalston-lane, and the Enfield and Edmonton Railway at Edmonton.

The City extension of the North London Railway, which was authorised in 1860, will, it seems, have its terminus in Liverpool-street, Bishopsgate-street.

It is difficult to make an accurate enumeration of the schemes, or to lay down on the map of London the proposed works and the sites of stations. The lines about Wandsworth, appear very complicated without such a guide. Mr. Stanford's advertised map, if posted up from time to time, may be of service; but the want of good planning which will become a feature of the area of London, will deduct much from usefulness of the means of communication provided. Besides the lines mentioned, however, there are several others. The Charing-cross Railway, which will be connected with the South-Eastern line and the South-Western, will include a line from Charing-cross to Cannon-street,—a more direct route than, without looking to the map, might be supposed. The second bridge will be commenced immediately. The line between Charing-cross and London Bridge, is expected to be completed this summer.

Amongst the proposed lines which would run at a lower level than that of the streets, are the Albert Station and Mid-London Railway, the Regent-circus Railway; the Metropolitan, Tottenham, and Hampstead Railway; and the Kensington, Knightsbridge, and Metropolitan Junction Railway, mentioned in our notice of the Metropolitan; a line passing through the Thames Tunnel; and the Midland Extension to London; but there may be some others. Of those named, the first and last have lately failed to comply with the standing orders. The Regent-circus Railway is proposed to commence at the Great Northern Terminus, and to extend to Great Windmill-street, Haymarket. It would cross over the Metropolitan Railway, the Euston-road being raised 11 feet, with an inclination of 1 in 30. The Hammersmith and City Railway will be connected with the Great Western line near to Portobello-lane, Notting Hill; and the other schemes include those of the Barnes, Hammersmith, and Kensington Railway; a line from the Blackwall Railway to the London Docks; one between Brixton and Peckam in connexion with the London, Chatham, and Dover; a Greenwich and Woolwich line; and the South London, Greenwich, and Woolwich Railway. The London and Brighton Company have lately opened their new line from Balham to Croydon; and are, we hear, about to commence another branch which will pass in the direction of South Norwood, across the country which lies between the first-named branch and the site of the Beulah Spa. Their station at Thornton-heath, by Collier's Water, has been established much in advance of the requirements; but if there are few houses now, there is most extensive preparation for them by the formation of roads. Indeed, in two or three years there will be no break of houses between the Crystal Palace district and Croydon.

The bridges proposed, taking in several that are for road traffic, are very numerous. We hope that the majority of them will be less unsightly than the Charing-cross Railway and the Lambeth Suspension Bridges. One bridge, a high-level, and suspension, would be east of the Tower. There would be others, as opposite St. Paul's; the Temple Pier; Cheyne-walk, Chelsea; Wandsworth, and several places above the metropolitan district. Thus, with the embankment on both sides the river, the new street to the Mansion House, the greater convenience of the steam-boat communication, by means of landing and embarking places which will be in connexion with the bridges; and the footways similar to those proposed for the Charing-cross Bridge, which may be added in other cases; improvement in metropolitan communications is likely to be realized sooner, and even more effectually, than we dared to hope for on occasions when we have treated the subject in its relations with the provision of healthfully-planned and situate places of residence, and with ameliorated condition generally of those who have to toil in the, to say the least, sombre, dirty, and mentally-depressing atmosphere of London.

The appropriation of open spaces like Finsbury-circus, however, will be a serious evil. Judging from Mr. Cowper's reply to a question by Captain Jervis, in the House of Commons, there are no adequate means of preventing such instances of movement in the reverse direction to improvement of the metropolis. We are, therefore, glad to see that Mr. Tite is urging upon the Government the institution of an inquiry into the nature of the various projects.

ROYAL ACADEMY LECTURES ON SCULPTURE.

PROFESSOR WESTMACOTT, in his second lecture, observed that though his last concluded with a somewhat unsatisfactory view of the prospects of sculpture, he endeavoured to show that its return to a healthier condition was by no means impossible or to be despaired of. He had with pleasure referred to the executive power exhibited in the present day; but he had felt it necessary to point out that the present art-impulse in England was calculated to lower the character of sculpture as an art of lofty purpose whose expression should be the highest class of form. But, he added, there was no reason why, if it could be practised on pure principles in its mode of presentation, and with choice of appropriate subjects, having regard to the speciality of this art, sculpture should not in modern times hold an honourable place even when compared with the best schools. This was the purpose of explaining to the younger part of his hearers the system of instruction offered by the Academy; that while the student was acquiring the mere mechanical parts of his art, he should also have his intelligence directed to the principles which should guide the sculptor's practice.

The present lecture was occupied with considerations of a more strictly practical nature. The subject was "Form,"—the crowning object of the sculptor's art. True sculpture can only represent by form. All other means employed by a sculptor to produce the impression desired are foreign to the genius and essence of this art. They usually fall into the category of trick; and such expedients, while they are unworthy the true artist, also have the effect of lowering the character of sculpture.

Thus limited in its means, it becomes very important to inquire in what manner this confined power should be applied.

It may be assumed that the form in which a work of sculpture is presented is understood to be only the *language* in which it is to make its address. The *object* the sculptor has in view is, through this language, to affect the heart and to move the feelings. The problem, then, is how to combine the expressive or sentimental in sculpture with the mode of representation that shall be at once true, and exhibit nature in her most perfect or beautiful aspect.

The highest class of form is found in man, or the human figure. It is, however, well known that from the accidents of life, this originally perfect organization is often subject to deterioration. The true *ideal* is, however, to be sought in the original uninjured condition of the work of the Creator; and the examples for the artist's guidance are to be drawn from this, and not from the less perfect exceptions. It may be asked—where is this ideal of perfection to be met with, it being admitted it is non-existent for general purposes in nature? It is to be found in those remains in which the observation, the sensitive feeling, and the acute appreciation of beauty of the greatest masters of form, the Greeks, have embodied it,—in the best sculpture of the best schools of this art. This is where the student is advised to look for it, and to study it,—not because it is Greek, but because the best Greek sculpture exhibits the most beautiful view of Nature. It took centuries for the development of this idea, but when once the Greeks perceived the value of their system, or rather principle, they strengthened its hold by referring its existence to a quasi-philosophical necessity, using the expression of the Good and the Beautiful as synonymous terms. Here, then, is the safest elementary school for the young sculptor's education.

The limited opportunity in our country for employing the entire nude forms in sculpture, affords no excuse to the student in this art for not making the human figure his most careful study. It should be the groundwork, the foundation of all his exertions. The best course for him is to accustom his eye to the best forms in the school of ancient statues. This will be the standard or gauge which will give tone to his feeling for form. These examples, as they are in fixed action, will be the safest objects for him to draw and model from. From these he may profitably proceed to study from living nature; and coming fresh from the discipline of the selected forms of the antique, he will soon see to what their excellence is owing, namely, to their being based on the only true foundation, nature; but nature without its commonplaces, its accidents, its deformities.

The study of the best works of the ancients leads to the recognition of the conditions necessary for that great result which we call the Beautiful in art. First, it accustoms the eye to its physical qualities, and the mind then by degrees becomes filled with the appreciation of its essential elements, as truthfulness of representation, correct form, fitness, harmony of parts with respect to the whole, and the agreeable flow of lines. The canon of proportion of Polycletus was referred to, with reference to this important condition of beauty and harmony; but, though such formulas have their suggestive value, the student was cautioned against supposing fine sculpture could be produced merely by the laws of the rule and compasses.

Some of the most remarkable statues of antiquity were reviewed for the purpose of showing the students in what their excellence consists; and at the same time the Professor pointed out how striking was the variety of form in all these, as it was required to express particular character; the types of Apollo, Hercules, Mercury, Bacchus, Cupid, and others, being all perfect of their kind, but at the same time differing widely from one another in their respective character of form. It was then shown that the standard of a high ideal among the ancients by no means excluded the most careful attention to natural details; provided only that their use was kept within the limits proper to insure the greatest amount of beauty. This was instanced in some of the sculpture of the Parthenon, now in the British Museum, especially in the statues of Theseus and Ilyssus. The students were advised to compare these with the Discobolus of Myron, the Dying Gladiator, the statue called the Fighting Gladiator, and other works, as instances of inferior treatment in this particular, notwithstanding their peculiar excellence in other respects.

Some works of very great merit by the eminent sculptors of the Italian schools, show the want of that just application of natural details and peculiarities in which the Greeks were such great masters. Michelangelo probably was the most learned designer of the human figure who has lived. His productions strike all judges of art by the energy of character and fearless dealing with form exhibited in them. Yet the effect of this great sculptor's works is admitted to be injured by the too ostentatious display of anatomical knowledge. This never occurs in the best ancient examples. In them the harmony of the whole is alone thought of as an end. The means are never forced into prominence.

A school of Realists would pretend that the mere conscientious copying of a natural object is, in itself, the perfection of art. And so doubtless it is, of mechanical art,—the art of copying. But such art would as often perpetuate deformity as beauty. The object of the sculptor being to express ideas and awaken sentiment by means of form, it cannot be reasonable, or a just homage to the author of perfection, to prefer imperfect form, the result of accident, for the purpose. There may be beauty in a very ordinary, or even ugly face; but this will be beauty of expression; and the beautiful that is there discoverable depends upon totally different conditions to those under consideration. In the sculptor's work, beauty of expression must not be distinct from beauty of form. His speciality is Form. He must not lose sight of that fact; and when Form is proposed to him for his study the very highest and best is intended. There will be sufficient room for him still to show the value of a close study of nature in his works; indeed, without this they will fail to make a lasting impression; but the sculptor must carefully restrain the impulse to carry this too far, and thus to injure the effect and force of the whole by too minute a rendering of parts, and especially of such details as are below the highest standard of beauty.

Some remarks were made upon the treatment of portrait and monumental works in which the taste for particular and minute accidents has often led the sculptor into the most egregious disregard of true art-principles. Thus, if a soldier were to be commemorated, it was not thought sufficient broadly to indicate the military character, but all the details of dress of the very battalion of the regiment to which he belonged, as buttons, buckles, and tassels, were to be correctly copied. But sculptors have gone even further than this; and if the hero, unfortunately, had lost any part of his person, he was to be sent down to posterity thus mutilated, perhaps with only one limb, or, of course, it might be without even one, if such accidents are to be perpetuated. Abuses such as these arise out of the present tendency to dwell upon littlenesses and unworthy details, to the injury of the broad principles which should govern the practice of all art, but which are essential to the success of sculpture. The lecture concluded with recommendations to the students as to the most profitable way of carrying out their studies in the schools of the antique and living model.

PROGRESS IN NEWCASTLE-ON-TYNE.

THE architectural works of this ancient borough are rapidly increasing. At the quay side, where a large amount of rotten and comparatively useless property was destroyed by the great fire and explosion some years ago, there have risen stately piles of buildings. At the north end of the High Level bridge, and near the Blackgate, which leads to the Castle Garth, an immense quantity of old and unwholesome property has been cleared away, and a large and substantial block of buildings, consisting of shops and offices, erected on the site; and we believe that it is intended to continue a uniform line past the west front of St. Nicholas's church to Collingwood-street. The change which will be effected by these alterations in this quarter of the town will be extraordinary. Thirty or forty years ago every building, with the exception of those in Collingwood and Mosely streets, had an ancient and dilapidated appearance. North of the church ran three streets, viz.—the Groat Market, so called from selling oatmeal there; the Middle-street, and the Cloth Market, the latter so named in consequence of an old fair for woollen cloths being held there. The whole of the two central blocks of building were removed some time ago, and the new town-hall is built on the spot. Formerly the view from the Groat Market, looking southwards towards the Norman keep of the castle, was very picturesque: in the foreground stood gabled and quaint-looking houses, and the varied materials of brokers' shops; then came the fine dark grey tower and beautiful lantern of St. Nicholas's church; and towards the Head of the Side the old buildings harmonized well with the massive and crumbling walls of the castle. Ere long, with the exception of the church, the Blackgate, it is to be hoped, and the castle, nearly all will be new which meets the eye here. In Westgate-street changes are also going forward. Immediately above St. John's church is a very good building for the Savings' Bank, and above it a large house with offices for Dr. Gibb. On the site of the old Grammar School, which should, in consequence of its interesting association, never have been removed, stands the monument of George Stephenson. The situation is not altogether satisfactory. Towards the Central Railway Station new and important buildings are springing up rapidly, while at the station itself a vigorous start has been made with the large portico, which will give to Mr. Dobson's noble building a very imposing appearance. Several churches and chapels, too, have been built.

The Tyne is being rapidly improved: what with the dredging and the effect of the sea piers at Tynemouth, ships of nearly twice the former dimensions can now come into the port. There is now on the bar a greater depth of water by 5 feet than there used to be; and all the way to Blaydon (about six miles above Newcastle Bridge) the dredging is being vigorously carried forward. It is hoped that when these labours have been continued a little longer, and the central arch of the old bridge has been removed, and a drawbridge substituted, ships of a considerable size will be able to sail to Blaydon. If this be successfully carried out, and we see no reason why it should not be done, important manufactories will speedily cover both sides of the Tyne in this direction.

In the days of the old corporation vast sums were raised by a duty upon coals, which, if properly applied, should have long since placed both the town and river in an excellent condition. Instead, year after year, shoals were allowed to collect; and in place of large ships being able to reach Blaydon, it was difficult for coal-keels and barges to make a voyage in this part of the river; and after an Ascension Day, when it was the duty of the Corporation to make a survey of their watery boundary, the mayor's and Corporation barges would be stranded for hours. In other parts of the Tyne the impediments were no less troublesome.

As regards sanitary matters, improvements are in progress; but this is slow work, and much requires to be done.

At present there is no cultivated public park; yet north of the town are immense tracts of very desolate-looking land. Part of this is called the Leazes, and is chiefly occupied as a pasture-place for the cows kept by the old *freemen*, who, before the passing of the Reform and Corporation Acts, had the entire management of the pecuniary and other affairs of the town. There is also the Town Moor, a much more extensive tract of land, part of which is used as the race-course.

The general appearance of the Town Moor is desolate in the extreme. There can be no doubt that, if thoroughly drained, both as regards the surface and deeper, and properly cultivated, this range would be very healthy, and the aspect of it would be soon materially changed. Persons in the town have, therefore, proposed to form part of the moor and the Leazes into an ornamental public park for the use of the inhabitants of the town, and to erect certain terraces along the north road, which skirts the margin of the Moor. This scheme is likely to be promoted by the corporation and a large proportion of the inhabitants, but the change will be most violently opposed by the freemen.

It is argued that the Town Moor and the Leazes are at the present time useful as a playground for the youth and children of the rapidly-increasing population. No one would more anxiously preserve useful open spaces than the writer, but in its present state all this land is little better than a waste; and even the cultivation of the district would—not to say anything as to the improvement in beauty—also be beneficial to the health of the town. Besides, there is no necessity for the introduction of a park-like appearance

preventing the usefulness of the land as a playground. An excellent example of this may be seen in the Victoria Park, in the east of London, where are some of the choicest ornamental grounds, and also plenty of space for pasture and all kinds of games.

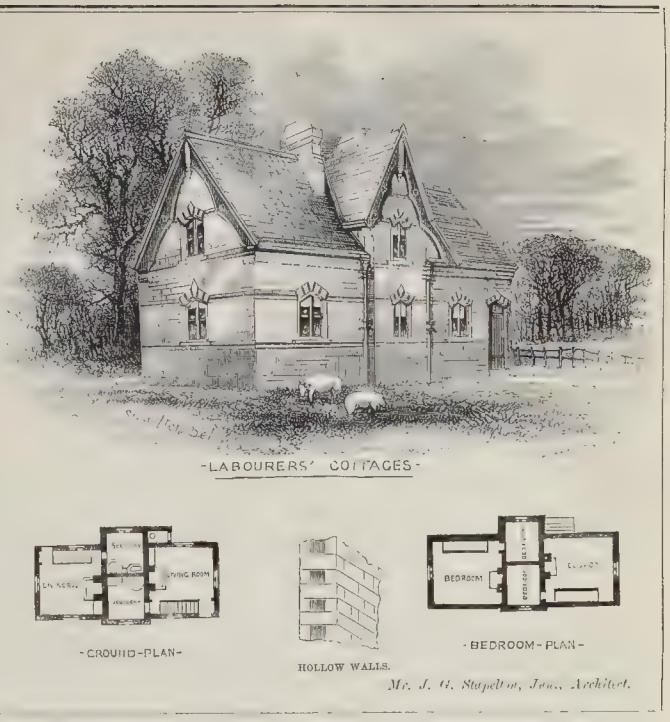
Formerly there was to the east of Newcastle-upon-Tyne a beautiful walk, one part of which is called Pandon Dean, and the other the Ouse Burn. Here Bewick and his pupils, the Richardsons, Carmichael, Mole, and many other native artists, have studied with advantage. The former of these places, owing to railways, may be said to be amongst the things of the past; and, as regards the latter, its picturesque charms have been diminished by various recent and unsightly introductions. We are told, however, that Sir William Armstrong, of the great cannons, who has a residence at a place called Jesmond, on the banks of the Ouse Burn, has recently bought the whole of the estate from the authorities of Busy College, near Durham. The natural advantages of this spot are great, and exertions are being made to add to these by constructing, near the picturesque and rugged old water-mill, and elsewhere, water-falls, rustic bridges, and so on.

Lady Armstrong has also built upon the grounds a large banqueting-hall of fancy-coloured bricks. The inside walls are covered with coloured tiles. This hall is intended for tea-meetings, and other gatherings of Sir William's numerous workpeople, and the societies and schools of the town and neighbourhood.

With all these matters for congratulation, crimes have been committed which, notwithstanding the intellectual character of the bulk of the inhabitants, show that there is here, as in most other large manufacturing towns, an under-current of neglected ignorance. The children who are growing up in the poorer neighbourhoods should be looked after. It is not in Lancashire alone that the terrible war in America is felt: even in Newcastle, which depends so much for prosperity on our own resources, there are loud complaints. Nevertheless, it seems that there are large orders, amongst others, for stained glass from America, and that much is in preparation for India, Australia, and New Zealand, and for various parts of Great Britain. Since the days of the venerable Bede the Tyne has been famous for its glasswork for ecclesiastical purposes.

MEMORIALS AND MONUMENTS.

Royal Commission to Mr. Noel Paton, R.S.A.—Mr. Paton has been commissioned by her Majesty, says the *Scotsman*, to paint a picture memorial of the Prince Consort—the Royal Family around their widowed mother,—all there but the inestimable, irreparable one—



"Whom never more shall they forget or see."

Bishop Hooper's Monument.—The statue of Bishop Hooper has been formally unveiled in Gloucester, in the presence of the mayor and corporation, the local clergy, and about 20,000 spectators. It cost 100 guineas, and was executed by Mr. Thornhill, of Dublin. It stands on a stone pedestal, surrounded by a canopy and a Gothic spire, which have been recently erected by the poorer inhabitants of Gloucester and its neighbourhood, at a cost of about 400*l.*, on the spot where the bishop was burnt. The proceedings of the day celebrated the 308th anniversary of Hooper's martyrdom.

The Yarborough Memorial.—A meeting of the subscribers is to be held at Brigg on the 29th instant, to consider the following recommendation of the committee:—"That the memorial should be a statue of the late earl, placed on an archway across the public highway where it enters the Blocklesby Park from the Brigg road, in the lordship of Kirmington;" or to consider any other memorial that may be proposed.

Statue of the Seventh Earl of Derby.—We understand that a movement is on foot for erecting in Bolton a statue to the memory of James, seventh Earl of Derby, decapitated in this town during the Commonwealth. The gentlemen who have taken the initiative have secured the services of Mr. Calder Marshall, who is preparing a model for inspection.

The Dalhousie Statue.—Mr. John Steell, R.S.A., of Edinburgh, has just completed a marble statue of the late Marquis of Dalhousie, which is to be placed in the Dalhousie Institute at Calcutta. It is a portrait statue in civilian costume, with a military cloak, and is rather above life size. There is no time, it seems, for exhibiting it in this country.

LABOURERS' COTTAGES.

THE cottages illustrated by these engravings were erected in Kent for 180*l.* per pair.* The living-rooms are 14 feet by 12 feet. Contracts have been again taken for the erection of similar cottages in Sussex and other parts.

The walls are generally lime-whited internally, and not plastered. Mr. Stapelton, jun., was the architect.

NOTES ON THE PROPERTIES OF WOOD.

BY wood we understand that portion of a tree between the rind and the marrow, and we have to distinguish the heart from the sap wood. In hotter climates trees generally grow largest. A piece of heart wood is heavier and harder than a piece of sap wood, and a piece cut from near the root will be heavier and stronger than a piece cut from near the top.

The size to which some trees grow is astonishing. A few famous chesnut trees on Mount Etna measure from 60 to 80 feet in circumference: near Worms, in Germany, grows an elm tree (*Ulmus campestris*), called the Luther tree, 116 feet high and 35 feet in circumference: on the island of Teneriffe, a *dracæna* (dragon tree) is seen, 80 feet high with a diameter of 29 feet. Still larger than these are the mammoth trees (*Wellingtonia gigantea*), and the firs, found in America, some of which are reported to measure 400 feet in height and from 60 to 80 feet in circumference.

The inner structure of trees is the foundation of all the singularities of the woods. It is the same in most European and other trees. If we look with the assistance of a magnifying-glass at a cross section, we observe in the centre the marrow, next to it the heart wood, then the sap wood, the cambium, and the bark. From the marrow run out towards the rind thin lines, which are crossed by rings, taking the appearance of the cobweb of a spider. These rings indicate the age of a tree, one being in general added every year. Some trees live very long: for instance, the Adansonian, standing on the banks of the Senegal, is estimated to count nearly 6,000 years.

The yearly rings stand in close connexion with the development of the leaves: if we find them imperfect, it has been caused by the loss or the freezing of the branches. It might also have been effected by dryness, or by insects and larger animals who live upon and in the trees. Among the most destructive in the animal kingdom which attack trees are enumerated the cockchafer, horn-beetle, the barkscrab, the castor, hares, rabbits, squirrels, and deer.* In some instances it has been found that the August sap forms in the same year a second ring, by which the age of a larger tree becomes doubtful if it is estimated from its yearly rings. The formation of these rings is not so clearly marked in the wood which has grown in hotter climates. A strange appearance is caused by the unequal width of the rings, and in fact it is never that two of them are found alike, or at least very seldom. This feature is, however, of value, because one may judge by it upon the physical condition of the wood; and we will, therefore, examine this point more closely.

The fir, which grows on very dry marl, forms very narrow yearly rings; if on rich or damp marl, they are wide; and when on wet soil, they are again smaller. The common fir, on moor soil, has even smaller yearly rings than if on dry sand or marl. From this it is evident that too wet or too dry a soil is not suitable for the promotion of this tree.

The alder (*Betula alnus*), the willow (*Salix*), and partly, also, the ash tree (*Frascinus*), grow best on wet soil, and thrive but poorly when standing dry.

The healthy life of a tree requires a certain amount of light and constant fresh air, which are necessary, besides the nourishment which it derives through its roots from the soil. If a tree is transferred into a more suitable climate or richer soil, it will naturally improve in condition; but should any element be deficient, we shall notice no improvement, or the tree may improve in one way, such as increase in size, while it suffers on the other hand; for instance, loses in its specific weight. A pine with small yearly rings is of good quality, for we find each spring or summer ring surrounded with riper autumn wood, richly saturated with resin.

Towards the bark the autumn rings remain about the same thickness, whilst the softer portions are seen larger. A white fir-tree, twenty-five years old and situate in a tolerably suitable ground, may have a diameter of 3 inches or more, whilst another on dry ground will be but 1 inch thick. With the former the yearly rings will be 2·5 mill., and with the latter 0·16 mill. If we submit a cross section of each under the microscope, the former will appear like a net with

* See Vol. XIX. of *Builder*, page 600.

* A full description of these and their peculiar habits may be found in Ratzeburg's "Waldverderber."

large pores, while the second looks almost like one solid mass. This fact illustrates the cause for the many accidents which have not their immediate origin in the rotten or bad state of timbers. The greatest attention should be paid to the point in the selection of masts and spars in ship-building yards. The usual width of the rings in the fir, when young, is 2·4 mill., with a slight decrease towards the bark: the smallest rings are found in the Swedish and Russian firs: this may be ascribed to the short summer in those climates: however, they are found similar in more southern climates; therefore the same result is brought forward under different circumstances.

The leafwoods with large pores deserve special observation. Analogous but opposite to those made with the pines, we notice with them that, although the rings become smaller, yet the quantity or bulk of the porous spring wood does not diminish at the same ratio; therefore, a cubic inch must contain more mass the less we find pores in the same; or, in other words, the broader the yearly rings, so much greater will be the mass of the wood: the reason is, that the pores are considerably smaller on trees with broader yearly rings, and at the same time less numerous. The outer rings of trees are often found almost as porous as the root-wood. This is still more frequently the case with the branches of the trees. If we have, therefore, to select between two oaks, we shall choose the one with the broader yearly rings, because we shall have in a cubic foot of the same a larger quantity of wood than in the other.

Should it so happen that a whole forest produces trees with wide yearly rings, and another forest trees with small rings, then the question arises whether the former is caused by the wet condition of the soil; in which case the wood in the first will be more porous and loose than in the latter. We must, therefore, take into consideration the specific weight, as well as the broadness of the rings; and if we find both correspond, then we may conclude that the timber is sound. Wood that has rings of more than 6 mill. wide for a section of some inches, should not be used in building: it is only fit to be burned. Trees which have grown in marsh or clammy soil, along rivers, furnish bad timber.

If we dissect the stem of a tree throughout, and notice the yearly rings, we find many diversions, for the explanation of which we have to refer to the organization of the growth of the tree.

In pines we find more regularity in the width of the rings, from the centre towards the bark: this process depends much upon the position of the tree and the surrounding influences. With leafwoods we find a greater variety in the rings, but these as well as the pine have that same feature in common, that the rings increase towards the bark, and that close to the latter they decrease again. The number of branches influence the width of the rings in their position; and if a stem was cut through in its centre, we might then form the relative width of the rings in the various heights, and come to a conclusion as to the cause of their changes. It is necessary to remark, that the assertion that the rings are wider on the south side of a tree than those on the north, is devoid of all truth; still, excentric trees have broader rings on the projecting side than on the flat side; also inclined stems and branches show them smaller on the upper side. The bark is of importance to a tree: it acts as a protective band for the distribution of the sap, and is therefore necessary for the formation of the yearly rings. If the bark is damaged or split in a certain place, we observe that the next following ring increases considerably at this wound: an exception of this is the almond tree (*Amygdalus*), which bends hollow in the place where the bark has been damaged.

If we turn our attention to the condition of the woods, and take a cross section of the stem half an inch thick, it will hardly be possible to detect any difference between the younger and the older wood. If we take a stem of the same wood about as thick as an arm, the centre portion will appear dryer and may be called the ripe wood, while the outer portion is charged more with sap, and called sap-wood. With many timbers the heart-wood is of a deeper colour, or between the ripe wood and the sap-wood is a portion of different colour.

The ripe wood absorbs water less than the sap-wood: it has a greater durability, and it is not so easily decomposed as the latter.

In some trees the destruction commences with the ripening of the wood; for instance, the Canadian poplar (*Populus*) and the willows (*Salix*), which begin to darken in the centre; and by their smell they indicate their decay.

The sap-wood of hard wood trees is of little use: it never lasts for any period; and when used it only serves to introduce destructive organs into the better wood.

When trees arrive at a certain age they should be cut down, if it is intended that their wood should be of good and durable quality. If they are left growing the quantity of wood will certainly increase, but the quality will suffer.

The limits of the period when the trees are to be felled depends upon the development of their wood.

The colour is a prominent feature, not only with the various species, but also of the quality of the wood. If the tree is felled in a rainy or damp atmosphere, for instance, during a mild winter season, then the heart of the wood will retain its natural wet colour for a longer period. In a dry spring atmosphere the heart-wood dries sooner, although the sap-wood retains its moisture longer than the ripe wood of the stem: by this latter process the moisture evaporates and draws towards the bark, by which the sap-wood takes the darker colour of the ripe wood. The proper colours of the various woods are only fully developed after they have been exposed to the influence of the atmosphere for some time. The time when the timber is highest in colour is said to be during the period when the tree is in full bloom, which assertion has, however, not yet been fully verified.

If the colour of an oak is of one cast, it is a sign of its good condition; but it must be of the same shade in the ripe wood as well as in the various yearly rings: as the shades stand under the influence of action from without, a proper judgment upon the condition of the wood can only be given when the tree is forested. In some instances the scent of woods enables us to pass a judgment upon their condition. Persons who pass in the first spring month a number of old white poplar trees (*Populus alba*), will notice an obnoxious smell: this proceeds from the sap, which flows from the decayed interior to the outside. The pine wood will retain its natural smell for years. Leafwood trees have generally a sour smell, and it is reckoned that the stronger it is the healthier is the wood. Should this smell be faint we may judge that the tree is dying off.

The sap which circulates in the tree and promotes its life is composed in its main portion of oxygen, hydrogen, carbon, nitrogen, and sulphur. The same forms a considerable body in the green or fresh wood: it changes more or less in the quality of the wood, and the intimate study of its influences is of great technical importance. It has been said that the sap flows out of a tree after it is cut down. From experiments which have been made it resulted in this being the case with very few woods, and not with the majority: with most of them the moisture evaporates.

The quantity of sap changes very considerably during the season of the year. In elucidation of this a fine example is furnished to us by M. Duhamel de Monceau, and described in his work, "Exploitation des Bois." During the years 1732 and 1733 he felled each month eight oaks of equal age, and from the same spot. These were cut immediately into twenty-five pieces, each 3 feet long and 3 inches square (Paris measure), and he obtained the following results:—

340·718	pounds (Paris weight) in	December.
340·906	" "	January.
328 031	" "	February.
33.·487	" "	March.
311·875	" "	April.
319 500	" "	May.
297·312	" "	June.
297·250	" "	July.
314·469	" "	August.
3.6 875	" "	September.
328 906	" "	October.
331·000	" "	November.

One pound Paris weight = 1·0769 avoirdupoise.)

From these figures it appears that, during the months of December and January, the trees contain more sap than at any other period. It diminishes in October, November, February, and March; next in April, May, August, and September; and its quantity is least during the months of June and July.

From another experiment, made in 1737-38 with six stems of young oaks, it was ascertained that the lower portion of the trunk weighed (hydrostatically determined) of the December wood, 1·132; April wood, 1·016; July wood, 1·017.

This proves that there was most sap in the December wood. The difference between the April and July woods remains doubtful. The same pieces of wood were also weighed when dry, and, compared with the fresh weight, it gave the following result in lb. weight:—

	Green.	Dry.	Loss of Sap.
April wood	57·339	41·839	15·500
July wood	91·851	68·226	26 625
December wood	77·062	52·375	24·687

This shows that the quantity is most in December, and least in July and August. We must not overlook in these cases to take into consideration the influence of dry and wet seasons, by which the sap is materially affected. Contrary to the preceding experiments, the notion prevails that the quantity of sap in a tree is more in the spring than at any other season. Another author, Mr. Th. Hartig, found, after many experiments (which are fully described in Nordlinger's "Technical Properties of Woods") that, upon the average, with most woods the greatest moisture is in the trees during the months of January and February. He reckons it at 50·05 per cent. During the months of March and April some trees discharge through their bark a quantity of sap, from which one should believe that they were full of it, while only 47·5 per cent. is really in them. In May and June they hold 48·5 per cent.; in July, during which the yearly ring is formed, 50 per cent.; and in September, when the ring is fully developed, they contain 48 per cent.

The large amount of sap which is found in stems during the winter months diminishes towards the spring.

Heavy hard woods lose by drying about one-third of their original weight: lighter woods, poplars, alders, pines, &c., lose from one-third to one-half, which in some degree is dependent upon the soil where they were grown. The bark prevents the sap from running out of the stem; therefore, if pieces were taken from the same stem, some with and others without the bark on, it will be noticed that those without bark will discharge much quicker than the latter. Experiments have also proved that the weight of pieces with their bark on fluctuates, whilst the weight of barked wood steadily diminishes. The cause of this difference is most probably due to the hygroscopity of the bark to absorb humidity from the atmosphere.

Wood never loses all its sap: when it becomes air-dry it generally has about 20 per cent. of its weight. It is of importance to know how long various timbers of different dimensions and strengths will take to become air-dry; that is to say, how soon will they arrive at the medium weight which they always maintain, and to which they return whenever the influence of the atmosphere alters it.

Many mechanics require dry wood for their work, but it is not seldom that they use it before it is properly seasoned.

I have before alluded to several instances which affect the due seasoning of timber, and from these it is impossible to adopt a general rule, because in each place surrounding influences must be taken into consideration. Let me, however, refer to the cause of the warping of floor-planks, which has its reason,—that the air does not reach the lower side of the deal. It shows itself stronger where the plank has been planed at the top and the lower side has been left in its rough state, by which a larger quantity of moisture is discharged by the outer side, which causes the warping.

In exposing various woods to the action of water, it will be found that the younger stems are more subjected to its influence, because it absorbs more water than old wood. For hydraulic constructions, none but well-seasoned old hard woods should be used; and the sap wood should also be avoided, because it promotes the decay of the sound parts. The specific weight must next be taken into consideration.

Most of the woods swim in the water. The specific weight of wood is found by taking the dry weight, then thrown into water until quite saturated, after which it is weighed again. We must then weigh it under water. If we then divide with the difference of the second and third weights, which represent the weight of the water displaced by the wood, into the natural dry weight, we obtain the specific weight. This answers in general well enough, but it is not so correct as the process recommended by Mr. Marcus Bull. He justly observes that the wood is liable to swell in the water; and after having taken the dry weight he covered the piece of wood with a varnish having the exact density of the water. This varnish is composed of rosin having a density of 1·079, and wax having a density of 0·967. By this varnish the water cannot penetrate into the wood.

The solid matter of the wood divested of all cavities is heavier than water, and its density or weight, compared with that of water, varies, according to Rumford, from 1·46 to 1·53.

It is very difficult to give a general figure for the specific weight of any kind of wood. Pieces from the same tree produce different results, but the following figures give an average weight:—

Ironwood	1·210
Greenheart	1·200
Sabacue wood	1·100
Brazil wood	1·100
Ebony	1·080
Box	1·050
Medlar	0·950
Lilac or pipe wood	0·930
Oak	0·855
Beech	0·852
Ash	0·845
Yew	0·807
Elm	0·800
Apple	0·793
Fir	0·657
Lime	0·604
Cypress	0·598
Cedar	0·561
Poplar (silver)	0·529
Sassafras	0·482
Poplar (common)	0·383
Cork	0·240

The weight of water for the above is taken at 1 000.

Experience has shown that the time when trees are felled has much influence upon the condition of the wood. A trial was made in Germany with four pieces of oak, cut down in December, January, February, and March. A tin ring was fixed at one end of each of the four pieces: these rings were filled each with two quarts of water, and it proved that the piece of wood cut in December did not permit any water to pass through its pores.

The January wood, after forty-eight hours, passed a few drops; during the same time the entire quantity had run through the February wood; and the water had passed through the March wood in two hours and a half. This accounts for the fact that barrels, of which the wood was felled in February or March, will lose within a year as much as 8 quarts of water, whilst others lose hardly any at all. One should suppose that wood would absorb salt water more easily than fresh water, because of the pressure of the former being so much higher; still, this is not the case; and Mr. Duhamel has proved this by an experiment. He took two pieces of oak from the same plank, each weighing 5 pounds. During eleven months the one was exposed to sea water, and increased only by 2·141 lb. in weight, whilst the other put into fresh water increased by 4·141 lb. in weight.

Wood which lies in the atmosphere will constantly vary in weight, which depends upon the wet or dry season, and as the action is accordingly, we find the wood in its section, in a regular hygrometrical action.

If we attempt to abstract all moisture by heat from the wood, we must not forget that at the same time we destroy its nature; that is, the physical condition of the wood, by which it becomes very liable to break. Too much hot oil on wood has almost the same influence: by this it loses considerably in weight; and soon after the oil has been put on, the wood becomes brittle, and warps more easily than in its natural state.

The remainder of the sap, which is left in the pores of the timber, serves as a binding substance in the whole. It also prevents hygroscopical action provided the tree was cut at the proper time. The hygroscopicity is in constant action in the wood, and affects its body, shape, and weight, which in time leads to its dissolution.

This change is as much a chemical as a physical process, and is noticed in all woods. The weight of wood is of great importance to us because its hardness, resistance, and its heating power, as well as other valuable properties, are all more or less depending upon it. Let us, therefore, enter closer into this subject. In the first instance, we must consider that even wood which has been forested very light will become heavy when put for some time into water; but in such timbers the sap is already given to dissolution. If the fibre were the only substance in the wood, then the specific weight would depend upon the number of pores contained in its body: the pores are, however, filled with a substance such as rosin, die, &c. It comes to this: that young trees contain a great quantity of sap, whilst old trees have in the same proportion less; a volume of air being contained instead.

Suppose we leave the troublesome portion (the water) out of the question for a moment, and inquire into the reason which causes the heavier or lighter specific weight in dry wood.

The hardest and heaviest woods come from the hotter climates: the only exception is the pine which thrives considerably better and furnishes heavier timber when it has grown in colder regions or upon high mountains.

Trees grown on northern slopes furnish lighter timber than if grown on southern or western. In these remarks we have already noticed the fact that the soil has great influence upon the width of the yearly rings; and I also remarked that from this we are able to come to a conclusion in regard to the specific weight. We have since heard of a number of facts by which the connexion between the yearly rings and the specific weight is greatly modified; but, as an instance, I mention the fir and larch trees, which both are heaviest when their rings are smallest.

Another influence upon the specific weight is exercised by the resin and the die which are contained in the interior of the wood. On level dry ground or deep sandy soil we find the fir (*Pinus sylvestris*) beautifully red inside; in the same condition we find the leg-fir (*Pinus mughus*) on turf soil, where there is an abundance of water; but when we look at it on lias soil, it shows broad yearly rings and hardly any colour at all. The larch tree, again, in such soil developes itself well, with a rich colour. The cause for these appearances must therefore rest with the chemical condition of the soil and its effect upon the individuality of the fir. Oaks generally furnish good timber when grown slowly in dry ground, whilst those from wet soil appear comparatively spongy: similar results are obtained with other trees.*

JOS. JUSTEN.

A PREMIUM TO SCULPTORS.

THE ART-UNION OF LONDON.

IT should be known in artistic circles that the Art-Union of London has offered a premium of 600*l.* sterling for a group or single figure, in marble, to be competed for by life-size models in plaster; and, with that liberality of feeling which ignores any boundaries to the kingdom of art, the Council have decided that the *concursus* shall be open to artists of all countries.

The Society in question is far less known on the Continent of Europe than it deserves to be: and we are disposed to note a few particulars of its proceedings for the eyes of our foreign contemporaries, rather than for English readers, to whom they must be partially known. Represented by its agents in all quarters of the globe—from St. Petersburg to New Zealand, from Bermuda to Hong Kong, in Barbary and Port Natal, in St. Francisco and New Orleans—while in some years the subscriptions received have amounted to 650 guineas from the United States, 600 from Australia, 300 from the West Indies, the amount received from the whole of Continental Europe has never exceeded 200 guineas in one year.

We can only attribute this state of things to the want, out of England, of a general knowledge of the advantages which this institution offers. The subscription (one guinea sterling) is high as compared with some of the German art-unions, but the return is more than commensurate. The large reserve fund of the Society enables the Council to put into the hands of the best engravers the most important and interesting pictures in every department of art, and at this moment some of the best works of Frith, Maclise, and others are in preparation. The subscription entitles every member to an impression of one of the plates, to which is frequently added a volume of outline illustrations after the manner of Retzsch. These alone constitute a return worth double the amount of the subscription. The present year's guinea, for example, entitles each member to a very excellent engraving after Dicksee, and a volume of designs illustrating the "Idylls of the King." Besides the engravings there is the chance of a prize in the distribution, which takes place in one of the London theatres every year. The prizes consist of the right to select, by the prizeholder himself, from a public exhibition, a picture or other work of art from the value of 10*l.* to 200*l.* or more, besides statuettes and busts in bronze and in porcelain, medals in silver, choice photographs, some ceramic tazzæ (now in preparation), and other works.

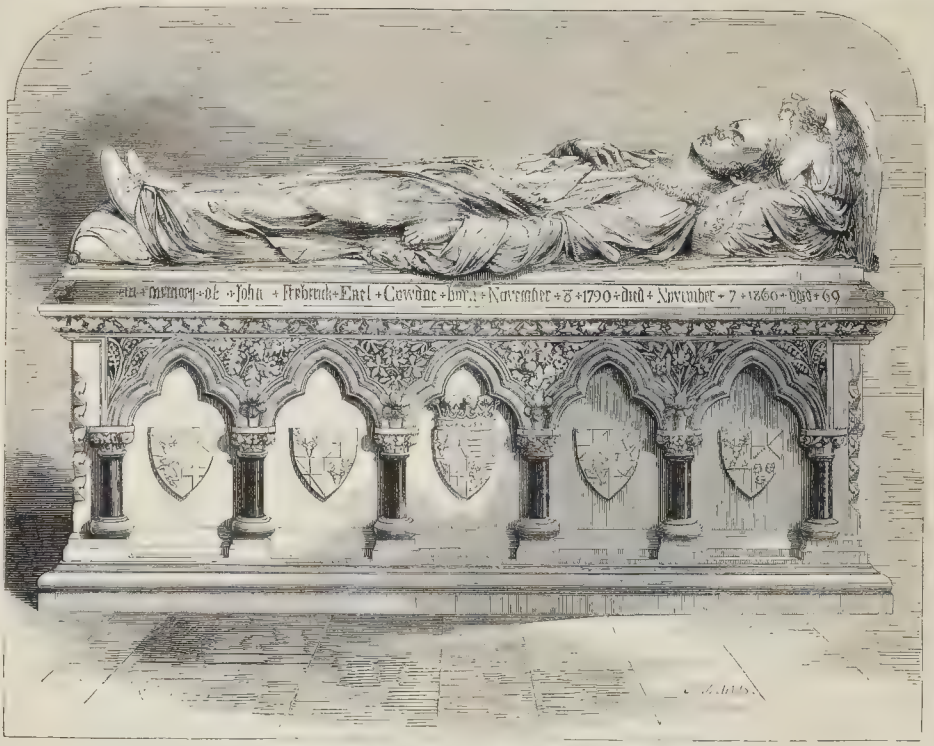
The bronze statuettes are fine specimens of the art, and will bear a comparison with the best samples of Paris work. The production of statuettes in statuary porcelain has been brought to great perfection of late years in England, and the specimens of this work prepared for this society (who may be said to have initiated them), all from copyright models, and exclusively produced for the members, are carefully selected, so that not a faulty or imperfect cast is permitted to go forth. The last work in this material is especially interesting at the present moment, being a bust of the Princess of Denmark, whom the Prince of Wales is about to wed. It is reduced by Mrs. Thorneycroft, for the Art-Union, with the special permission of Her Majesty, from the original portrait bust by the same artist, being the only likeness of the Princess for which she has yet sat in England to any artist.

The medallic series is of great interest, and now comprises fourteen medals, each commemorating a painter, sculptor, or architect, and one of his most famous works.

For these purposes the Art-Union of London, now in the twenty-seventh year of its existence, has raised and distributed the sum of 289,028*l.* sterling. It has sent into distant lands, in which the fine arts were quite unknown, examples of the finest works of ancient and modern art; it has immensely contributed to the increase at home of the love and appreciation of this means of civilization and refinement; and, moreover, it has helped on the road to fame, by purchasing his early works, many an artist who is now quoted as an ornament of his time and country.

* Read at the Liverpool Architectural Society on Wednesday, the 11th instant. To be continued.

SCHOOLS OF ART.



The Birkenhead School.—The prizes at this school have been distributed in the town-hall, Mr. George Harrison presiding. The attendance of ladies and gentlemen was numerous and influential. The students and their friends also mustered in great force. The chairman, in course of his address, gave the following instance of the value of this institution to the working man. I had a labouring man, he said, at the Canada works; who, after he left this school, went to America; and soon after he left Birkenhead a medal came down from Government for him. I sent the medal to the man in the United States, at the place where he had obtained employment as a labourer. On its arrival he was showing it, as naturally he would do, with pride and pleasure to his shopmates. The fact reached the ears of the manager of the works, who called him into the office, and from that day he received very lucrative employment. That was solely owing to his having obtained the medal in the Government School of Art at Birkenhead. Mr. Harrison expressed his regret that the institution was in debt to the extent of 17*l.*, which, however, he cleared off himself.

The Gloucester School.—This school, established in 1859, is at present almost self-supporting. During the past year there have been 128 students in the different classes. Of 89 students there were as follows:—Artist, 1; builders, 6; carpenters, 5; engineers and smiths, 10; railway engineer and surveyor, 1; house-painters, 2; ironmonger, 1; governesses, 2; shipwrights, 3; stonecarvers, 3; shopkeepers and assistants, 8; schoolmasters and pupil-teachers, 15; tinplate-worker, 1; pattern-maker for iron-casting, 1; photographer, 1; wood-carver, 1; plumber, 1; of unknown occupations, 27. Besides these there have been 39 female students attending day classes, and 100 children in the national schools, taught the elements of drawing and geometry. The prizes awarded by the Government inspector have amounted to thirteen medals.

The Brighton School.—The medals and prizes awarded to the students of the Brighton and Sussex School during the past year have been publicly distributed at the Pavilion, before a large and influential audience, composed for the greater part of ladies. The mayor occupied the chair, and Mr. W. Coningham, M.P., and the Rev. J. Griffith addressed the meeting. In national and other similar public schools, 691 children of the working classes had been taught by the head master during the year; and at the School of Art there had been 39 day pupils (8 gentlemen and 31 ladies) and 120 evening pupils (viz., 85 artisans and 35 schoolmasters, pupil-teachers, &c.), making a total of 159, or 850 if the national and other school children were added. The examination took place in December, and the results were that six medals were earned. Mr. Griffith stated that the school was 30*l.* in debt, and suggested a shilling subscription in aid from all present,—a proposal which was heartily responded to, many giving much more than the required shilling.

The Sheffield School.—The annual *conversazione* of this school has been held with the customary *éclat*. The rooms were filled, and various works of art were exhibited. In the course of the evening the distribution of prizes took place in the lecture-hall, the Right Hon. J. S. Wortley presiding, and the meeting was addressed by the chairman, and by Mr. Cole and Mr. Redgrave.

THE ROYAL SCOTTISH ACADEMY.—The thirty-seventh Exhibition at the Royal Scottish Academy opened on Saturday, 14th inst.

MONUMENT TO THE LATE EARL OF CAWDOR.—Mr. Forsyth, Sculptor.

MONUMENT TO THE LATE EARL OF CAWDOR.

This monument, which is erected in the family mortuary chapel in Cheriton Church, near Pembroke, is executed principally in Caen stone, the columns and capitals being marble and alabaster. It is fixed against the wall: the sculptor has, therefore, with a view to give effect to the salient points of the figure from the front, made the head rest a little on the left side, thereby giving the spectator a full view of the portrait, which, we are informed, is successful; and from the arrangement of the hands, which are both in full view, a variety of lines is induced with a repose which gives the *ensemble* a natural and pleasing effect. On the upper moulding of the tomb is an inscription on brass, relating the age of the deceased earl. There is also an inscription in the panel at the head of the tomb, containing the names of his children, by whom the monument was erected. The front panels contain shields with the arms of the different branches of the family.

His lordship was an F.R.S., a D.C.L., and lord-lieutenant of the county of Carmarthen. He built and restored many churches in Wales, nor was he unmindful of the temporal necessities of the poor.

Our readers will probably remember the model of this monument in the Mediæval Court of the late International Exhibition. The sculptor was Mr. James Forsyth, of Edward-street, Hampstead-road, London.

ARCHITECTURAL EXHIBITION.

We would remind readers that drawings are to be sent in on the 2nd of March next. The committee have resolved to admit drawings exhibited at the International Exhibition which had not previously been exhibited elsewhere, but they appeal to architects to contribute at least one illustration of the result of their labours during the year, even if it be merely a detail of ornament or construction.

The report of the committee, just now published, shows that the Exhibition suffered last year through the International Exhibition: the balance in hand (73*l.*) was expended, and a debt of 25*l.* to the honorary secretaries incurred. It is to be hoped additional support will be given this year. The committee are making arrangements with the Society of Sculptors to exhibit in connexion with the Architectural Exhibition; and they feel that, if this can be effectually carried out, a material assistance will be rendered.

The Exhibition will be opened with a *conversazione*, on Wednesday, the 25th of March.

PHOTOGRAPHIC.

We learn from Paris that it is becoming the *mode* there for each lady present at a ball, to leave for the hostess her *carte*, in the dress then worn; and that this is leading to improvement in the means of producing them by artificial light. The photographers, who have probably aided in bringing this about, will reap fresh harvests. Does it ever occur to members of the mighty army abroad and at home now living on photography, that they owe something to Mr. Fox Talbot?——An ex-M.P. suggests that the requirement of a license to practise as a photographer, price say five guineas, would aid the revenue, and clear some of the back streets of establishments where somewhat questionable proceedings are said to occur.——The Photographic Society having determined to award prize medals for the best contributions sent to the Photographic Exhibition, Messrs. Durham & Fenton undertook to act as judges. At the last meeting of the Society, their report was read by the secretary, when the decisions were declared to be as follows:—1, for portraits, Mr. Claudet; 2, for landscapes, Mr. Bedford; 3, for instantaneous pictures, Lieut.-col. Stuart Wortley; 4, for composition pictures, Mr. P. Robinson; 5, for copies of pictures or reproductions, Mr. Thurston Thompson; 6, for best amateur contributions, not instantaneous, Viscountess Hawarden. In our brief notice of the Society's exhibition, p. 41, we pointed out these six contributors, without one exception, as the best.——Mr. Pouncy, of Dorchester, has patented a fresh mode of taking indelible photographs, with the agency of printer's ink. The time required to produce a picture is, moreover, shortened.

BAZAAR BRIDGES.

The idea of connecting the opposite banks of the Thames in its course through the metropolis by means of Bazaar Bridges, was suggested a year ago in the newspapers by Mr. Alcock, one of the members for East Surrey. In a more recent communication, the honourable gentleman showed the feasibility of the plan, and from calculations based upon the cost of the new suspension-bridge at Lambeth, concluded that a profit of 10 or 12 per cent. might be realized on the enterprize.

It has long been felt that the existing bridge communications of London are quite insufficient for the wants of the population, and to provide additional accommodation, a company has recently been formed for the construction of a number of new bridges to connect Surrey with Middlesex. It is proposed to meet the expense of these new structures by the levying of the usual tolls,—a most objectionable method, as practically shutting what ought to be a free highway, and affecting the poorer classes in an especial manner.

Allowing Mr. Alcock, and those who think with him, to speak for themselves,—The great advantage of the plan proposed by Mr. Alcock consists in the absence of any bridge toll whatever,—the interest upon the capital expended being paid by the rents of the stalls or small shops, with which the bridge is proposed to be lined on both sides.

There can be no doubt that free bridges of this sort, in proper situations, would be extensively used, and that the thoroughfare thus created would be sufficient to induce enterprising tradesmen to lease the stalls, and thus two classes of persons would thereby be benefited,—the shareholders and the tradesmen,—not to speak of the invaluable boon which untaxed passage across the Thames would be to the public at large. The accompanying sketches are intended to illustrate the general idea only,—not to show the mode of construction.

BAZAAR BRIDGE, AS SUGGESTED BY MR. ALCOCK, M.P.—*General View.*

A PORTION ENLARGED, SHOWING ROADWAY.

VIEW OF STALLS.

FLORENCE AND PALERMO.

WHETHER, with Rogers, we protest that

> "Of all the fairest cities of the earth
> None is so fair as Florence;"

or with Mr. Hemans,* that "the justness of that poetic dictum recommends itself more the more one contemplates this attractive centre of Italian civilization, olden and modern;" assuredly Florence is a very beautiful city; although we could have little difficulty, we dare say, in exposing some particularly ugly spots and blotches on the fair face even of Florence. Its stately structures, with their marble domes and towers; its cypress groves; and its ancient sanctuaries, have all an especial interest, however, not only for the Roman Catholic, but for every true citizen of the world.

"When one looks down on Florence from the height of S. Miniato, admiring delight may be blent with enthusiasm; for it is the very expression of a high-wrought civilization that scene of fair magnificence presents: the luxuriant Val d'Arno seems a fit framework; and the stately town, with its marble towers and domes, completes the brilliant picture as if by an artist-purpose."

The recent restoration of the ancient Basilica on this hill—so conspicuous an object from the quays along the Arno,—claims attention. A humble oratory amidst forests was the only monument originally marking the spot where Miniatus and his companions suffered martyrdom in the third century; but very soon (early in the fifth century) arose a church dignified by the title of Basilica; to which, become ruinous, succeeded, in 1013, the more splendid temple erected by Ildebrando, bishop of Florence, still standing, with essential features unchanged. This church has long ceased to be used for sacred rites, except that of interment, the commemoration of All-souls, and an occasional early Mass: its uses have now become those of a public cemetery, as is apparent from the numerous epitaphs against its walls and on its pavement.

"In no other Italian church is the celebration of All-souls so touchingly beautiful; and entering S. Miniato this morning [2nd of November, or All-souls], its aspect might strike us as too gaily decorative, too fairy-like, but for those funereal accessories suited to the day's ritual—the black-robed priests, the measured chant to organ-music, the velvet pall and catafalque, the yellow tapers in high candelabra, and purple banner hung from the gilded cross. Its whole area of pavement is flushed with flowers, in garlands, wreaths bound with black silk or crape, or bouquets in vases; and countless tapers gleam amidst these gorgeous piles of Nature's fairest treasures, their pale light aiding the mystic meaning which else might be lost in the joyous loveliness of such resplendent offerings. Here we see a cluster of branching lamps, here a circle of lofty candelabra, or files of humbler candlesticks ranged symmetrically on the tombstone, whose surface is, in some instances, one bed of piled-up flowers, evergreens, and that feathery dark-hued grass peculiar to the Tuscan Flora; but the whole solemnized by the cross, rising, plainly formed of unstripped boughs, from its centre. The cemetery outside is alike adorned and illumined: bright garlands hang against the time-worn marble walls; and where the chiselled epitaph is wanting, an affectionate tribute in large letters on a scroll stretched over the gravestone, supplies its place for the honour of the dead this day."

Lights in cemeteries, therefore, in honour of the dead, are by no means an extinct observance of long past time; but whether the tapers thus lighted in the cemetery of S. Miniato in the daytime are considered to "disturb the spirits of the saints," we do not know; but should rather think not; otherwise the practice would doubtless be prohibited, as it was by the Council of Eliberis, previous to the sixth century. At present, in Florence, there is clearly no prohibition:—

"The Florentines are indeed earnest, and ready for pecuniary sacrifices in regard to these observances, to a degree scarce equalled by other Italian citizens. I was told [continues Mr. Hemans] that one illumination before a monument in the crypt of S. Miniato had cost 100 francs; and the same day learnt that the good woman in whose house I lodged had spent seven scudi for the flowers and lights on the tombs of a mother and son cut off in the bloom of youth. For the whole day these decorations remain in this cemetery and temple."

The church itself is a remarkable-looking edifice.

"One is struck, at the first glance, by the aërial majesty and harmonious effect of this interior,—by the features of the early Roman basilica, preserved in their simplicity amid magnificent details that in no way interfere with the grandeur of the leading design. One singular feature is the spacious crypt, entered under arcades that bound the extremity of the nave, and made more important than the sanctuary itself, which we ascend to by a double staircase above this crypt (or confessional), the latter being thus seen into from the portals, together with the tribune and apse on the higher level. That lower church, divided into five aisles, supported by thirty-eight graceful columns, whose shafts and capitals are evident y (from their disagreement the spoils of more ancient and classic buildings, is a work of architecture extraordinary for the eleventh century; so pleasingly blended are solemnity and grace, lightness and solidity, in its character. In the tribune above are splendid specimens of marble intarsio, on the screen and ambo, unquestionably coëval with the church's origin; but the barbaric style of the figures under the ambo-desk, a supporting eagle with a statuette below, betrays the inferiority of all save the ornamental in that period's art, these being supposed by Rumohr (*Italienische Forschungen*) an offspring of some Greek chisel in the eleventh century. In the apse is a colossal statue of severe and imposing character,—the Saviour, in gold-embroidered vestments, on a throne, holding a closed volume, and giving benediction; the countenance stern and awful, with dark hair and beard, beside Him the letters Alpha and Omega, and below, the accustomed symbols of the Evangelists; on one side, the Virgin; on the other, St. Miniatus, dressed in the regal paludamentum, and offering a crown; palms, fruit-bearing trees, the pelican and dove, and, on miniature scale, figures of monks, occupying interstices; on a frieze below an imperfect inscription, with the date 1297. But is this referring to the mosaic's origin, or to restoration?

In this noble old church we are struck by analogies with the earliest basilica-type, and also by characteristics, thus soon developing, of the style peculiarly Tuscan. Nave and aisles are divided by lofty columns of veined marble, and at the centre an arch spans the width, corresponding to the chancel-arch beyond, and resting on clustering columns of dark green marble (restored in scagliola). Above the arcades on each side rise attics, pierced by narrow round-arched windows; and this whole surface of walls is ornamented with that inlaid work in coloured marbles distinguishing Tuscan Mediæval architecture; but here only of dark green and white; the latter forming the groundwork, on which are inserted diamonds, squares, circlets, and horizontal bands. Some beautiful Corinthian capitals have evidently been fitted to shafts not belonging to them: others, with flat, heavy foliage, betray decadence in art. In front of the arcades, between the upper and lower church, stands an altar, beneath a vaulted marble canopy, beautifully wrought in c ffers and *rovoni*, by Michelozzi, whom Piero de'Medici, 1448, commissioned to prepare this superb chapel for the Crucifix, once here, which bowed its head at the prayers of St. Giovanni Gualberto! Amidst the vicissitudes this church as passed through, several early paintings have been preserved, though others are faded into mere shadows on its walls. Some restoration requisite was ably achieved by Marini. It is six years since the renovation of this church commenced, and workmen are still engaged, though little remains to be done."

The new façade of S. Croce, commenced September, 1857, its first stone laid and blessed by Pius IX., promises a noble addition to the public embellishments of Florence.

"With an estimate of cost at 45,000 scudi, the energetic architect, Chev. Matas, began his task while but a few *paoli* were the instalment yet advanced towards that fund. A wealthy English resident (Mr. Sloane) contributed the greatest part of the entire amount: and in May '61 a royal decree ordered the Municipality to assign 56,138 lire. Long since was at hand the total requisite, for the rest from free-will offerings; and 80 labourers, in the year '61, pursued their work every day under the architect's continual direction. His design is founded, with modifications, on that preserved among the drawings of Cronaca, in a Tuscan Gothic accordant with this temple's character and with the finest models of sacred structure in this city, the material of native marbles, white, grey, dark green and dusky red. When uncovered to view, we may expect to admire in this work a splendid and harmonious design, worthy of the high traditional and patriotic honours attaching to *S. Croce*. Among rich but not over-elaborate details, sculpture has prominent place."

To this convent attach the gloomy and disgraceful remembrances of the Inquisition, whose tribunal and prisons were within its walls till the suppression in 1782.

We may take a glance at Sicily before concluding our notice of Mr. Hemans's interesting volume.

St. Rosalia is a highly-distinguished saint in Sicily; and ever since "the invention,—*i. e.*, the discovery,—of her relics" in 1624, the festival of St. Rosalia at Palermo has thrown all other festivals into shade, even in this paradise of religious highday and holiday observances. The relics were discovered on the ancient Mons Erta, which dominates the wide plain extending to the city of Palermo, and forms a striking feature in the scenery around the city. This height has long been known by the name of Monte Pellegrino: it is a constant resort of pilgrims to the Holy Shrine.

"A level path leads through the valley till, on doubling a steep headland at one extremity, we at once come in sight of the canonical buildings, sheltered by a lofty overhanging precipice, with a few cottages,—one a rustic *osteria* for refreshment,—that cluster around. An outer chapel, first entered, seems neglected and decaying; its only work of art a small statue of the saint on a porphyry column. Thence, emerging into the open air, we enter the sanctum sanctorum, or grotto-chapel above the tomb, where prevails a solemn dimness, partially illumined by silver lamps pendant before the altar, whose light gradually discloses, as the eye becomes accustomed to such gloom, the singularly blent features of art and nature in this wild sanctuary. Its vault of living rock expands into the form of a cupola adorned by fantastic pendants, like the honeycomb vault of Arabian architecture. The rudeness of the cavern-like interior brings into relief the splendours of altar and costly offerings; most interesting amidst which sacred objects, thus set in nature's framework, is the recumbent statue of the saint, by Tedeschi, displayed dimly by taper-light, through a double grating; as at the moment of death;—a death that seems rather the rapturous transit to beatitude, that 'melts in visions of eternal day,' than a painful crisis of mortality; the ecstatic and lovely countenance, as well as the graceful form, executed with consummate skill, though this work belongs to an inferior school of modern Italian art, and suffers in effect from the cumbrous magnificence of its golden robe, the offering, valued 2,000 ducats, from Charles III.; the brow crowned with roses, also golden, a profusion of jewelled rings on the fingers, a broken sceptre in one hand, whilst a little angel holds a garland of gold lilies, to place this also on the head: there is altogether an excess of pomp injurious to the artistically-beautiful and truthful in this figure."

How curiously this recumbent and entranced-like statue of "the Virgin Rosalia" of "the celestial life," in its cave, or grotto, reminds one of the ecstacies of mystic saints, in their cells and sanctums; and of the still more ancient trances of the holy hermits of Egypt in their grottoes, and of oracular sibyls in their caves, such as the one Æneas found at Cumæ's "city of the dead," where—

> "In her cave, upon a rock, by night,
> Reclined the mad prophetic Sibyl!"

About a mile beyond the gates of Palermo is a cemetery, planted with cypresses, whose dark foliage and lofty stems are visible from afar; the extensive platform they rise from being elevated above the surrounding valley, so luxuriantly beautiful, in which the Sicilian metropolis stands. Spacious buildings here adjoin an ancient church, originally attached to a Carthusian monastery, bearing traces of past magnificence, though now most forlorn, and apparently abandoned to the fate which threatens, of total decay. The church, in no way remarkable externally, presents, in the interior, an aspect of gloomy antiquity, spacious, lofty, dimly lighted, and stained by damp. To this church the Palermitan population was streaming for the vespers of Easter Monday, A.D. 1282, when the massacre commenced which has rendered "the Sicilian vespers" a phrase of horror. Charles V. mentions an eclipse of the sun on the day the foundations were laid, in the twelfth century; and here, exactly 500 years after the blood-stained vespers of Palermo, was formed the public cemetery.

The sanctuaries of Palermo acquire a new interest when viewed in connexion with recent events. Strange to say, amongst the most liberal and revolutionary of its citizens were the monks and clergy; and a singular scene presented itself at the Rosalian festival of 1860.

"On the 15th July that year, St. Rosalia's festival assembled a grouping of display yet unprecedented, and contrasts stranger than fiction ever exerted itself to imagine, within the Norman cathedral. From an early hour the national and the 'dictatorial guard' had been on duty within and around the church: presently, in all the pomp of Spanish etiquette, arrived the senators* in long black silk robes, with sleeves and collars of gold embroidered white, driven in two ponderous gilt chariots shaded by white plumes and overspread by the wings of the imperial eagle, heralds with drums and trumpets sounding in the van; but one whose appearance was greeted by the shouts of thousands louder than the burst of military music, came in a common hired coach. Entering the church, that man was received at the portal by the archbishop and canons with holy water and aspergillum, as royalty or its representative; and with this venerable retinue passed up the nave to the splendid sanctuary, a scarlet canopy supported over his head: that soldier in the red blouse sat on the viceregal throne, his broad-brimmed Calabrese hat on his knee, his black handkerchief loosely thrown round his neck, but acquitting himself with all the propriety required by his novel position during the Pontifical High Mass that followed; after which ceremony, the civil officers returned in the same state to the Royal Palace, but now escorting in one of their gilt coaches the Liberator of Sicily; and there in the post of honour, the long-robed magistrates opposite, visible to all through the glazed panels, was the place of the Hohenstaufen, Anjous, Bourbons, of the Viceroys of Spain and Naples, this day filled by Garibaldi!"

Mr. Hemans's new volume is full of curious interest: besides a mass of descriptive and historical details regarding the monuments and sanctuaries throughout Italy, there is much interesting matter in it as to Italian literature, poetry, and the drama.

SOCIETY OF ARTS MEMORIAL OF THE PRINCE CONSORT.

AT a General Meeting of the Society, on the 7th inst., Sir Thomas Phillips in the chair, the Council recommended that the memorial should consist of a bust of His Royal Highness in marble, to be placed in a suitable manner in the great room of the Society; and that a gold medal, to be called the Albert Medal, should be provided by the Society, to be awarded by the Council, not oftener than once a year, "for distinguished merit in promoting Arts, Manufactures, or Commerce."

Sir John Pakington, bart., moved the adoption of the report. He had no hesitation in saying that, in his opinion, the recommendation of the Council—that they should erect in that room a bust of His Royal Highness—was the best that could have been made.

Mr. J. H. Murchison seconded the motion for the adoption of the report; and he was glad to find that every suggestion which he made on a former

---

* "Catholic Italy: its Institutions and Sanctuaries." Part II. By Charles Hemans. Florence: Printed by Cellini & Co. London: F. F. Molini. 1862.

* The municipality of Palermo, as also of Messina, bear this dignified title, "senate," being composed of a pretor, and six assessors of patrician rank.

occasion had been adopted by the Council. He thought—although a bust was an appropriate method of keeping alive the memory of the Prince—yet, to perpetuate the great objects which His Royal Highness promoted when living, the founding an Albert Medal was a recommendation which was deserving of the strongest approval and support. This Society, he believed, since its foundation, had awarded no fewer than 20,000 premiums for the promotion of the arts and sciences; and if, in future, they had a medal to be denominated the Albert Medal, it would be as greatly coveted as the Copley Medal of the Royal Society.

Mr. J. Scott Russell said he would suggest the alteration of the word "bust." A bust, as generally understood, meant a rather insignificant work of art. If a little latitude were allowed, and the work of art were not called a bust, he should prefer it.

Mr. Godwin suggested the use of the words "sculptured memorial." He trusted that, whatever might be the result with regard to this question, the artistic element would not be lost sight of in the proposed Albert Medal, inasmuch as that was a branch of art in which they were at present very deficient, from the very little encouragement that was given it.

Mr. F. Lawrence thought the Council had very properly worded their report. A good bust was better than a bad statue. He hoped the decision of the meeting would be in favour of a bust, which they might all admire, as the result of competition amongst the artists of the day.

Mr. Underdown thought the recommendation of the Council should be adopted in the matter of the bust. He did not agree with the gentleman who had suggested competition for the design of the bust. He thought the system of competition in art was bad, and had this serious drawback—that the better class of artists would not compete.

Mr. W. H. Bodkin said, the wording of the report was such as to admit of any accessories to the bust which the means at command might enable them to supply, so that the report might be adopted in its present form, with the expression as it there stood, "to be placed in a suitable manner in the Great Room of this Society."

Sir John Pakington did not agree with Mr. Scott Russell in his remarks, depreciating, as he thought, unduly, busts as works of art. They must all have in their minds many instances in which marble busts were very splendid works of art; and he thought it would not be desirable that any expression of opinion should go forth from this Society to undervalue the importance of such productions. But having said this, on the other hand, he really felt very little choice in his own mind whether they placed in that room a bust or a statue of His Royal Highness. He thought the matter might be left open by the addition of the words either "sculptured memorial," or "portrait in sculpture."

After some remarks from other members,

Mr. Bodkin suggested that the resolution should be passed as it stood; and if hereafter it should be found expedient to depart from it and to extend their design, the Council could report to that effect to a future meeting.

The original motion and an additional motion as suggested were then both passed unanimously.

INSTITUTION OF CIVIL ENGINEERS.

Wood in India.—On the 3rd instant (Mr. Hawkshaw, president, in the chair), the paper read was "On the Woods used for Sleepers on the Madras Railway," by Mr. Bryce McMaster.

The native wood sleepers having hitherto been found for the most part to fail,—on the Madras Railway between 30 and 40 per cent. requiring to be renewed annually,—the author undertook an investigation with a view of ascertaining the causes of this deterioration, and whether those causes could be overcome, so as to render available the vast resources of India. Thirteen hundred sleepers, of sixteen different woods, were submitted to careful examination and scrutiny twice at an interval of twelve months. The sleepers were variously placed, both on embankments and in cuttings: in some cases they were entirely covered with ballast to a depth of 4 inches, while in others they were as much as possible uncovered, and completely so from the rails to the ends, the ballast being only raised 2 inches in the middle of the way, and sloped off so as to carry away the water under the rails. From these observations it appeared that only five woods—Chella Woonjay, Eloopay, Kurrah Murdah, Palay, and Karavalum—were sound at the end of two years, the other eleven not lasting even that time. Also, that when the sleepers where uncovered, decay was less rapid than when they were buried in the ballast. It was noticed, that of the sleepers beginning to rot, 19 per cent. had commenced under one or both chairs. This was due to the retention of moisture under them, and might be remedied, the author believed, by tarring the seats of the chairs.

English creosoted sleepers led, say, 100 miles by rail and 50 miles by road, cost 9*s.* 6*d.* each; while good, native wood, plain sleepers delivered at the works averaged 6*s.* each. If establishments and apparatus for creosoting were erected in convenient positions near to each extensive jungle, it was believed sleepers of common wood might be procured for 4*s.* 6*d.* each, and be creosoted for about 1*s.* each.

In proof that the resources of India were likely to be equal to the demand, reference was made to the report of the Conservator of Forests for the official year 1859-60. From this it appeared that from the Salem Jungle alone—one probably of twenty in the Madras Presidency—about 246,000 sleepers, or sufficient for 133 miles of railway, had been cut during that year. Of this number about 62 per cent. could not be used plain, and were practically useless, owing to the want of artificial means for preserving those of a perishable nature. But as a supply from each jungle of 2,000 sleepers per month would provide for the construction of 500 miles of railway in that Presidency within the next five years, and for a renewal of 33 per cent. of those already laid, it might be confidently anticipated that the supply would not fail, if means were taken to make the naturally perishable sleepers last a reasonable time.

Drainage of Towns.—On the 10th, Mr. McClean, V.P., in the chair, the first paper read was a "Description of the Drainage of the Borough of Dundee," by Mr. John Fulton.

It was stated that, previous to 1851, this town was in a most defective condition in a sanitary point of view. In that year the borough was brought under the powers of "The General Police Act for Scotland;" but owing to a defect in the drainage clauses of the Act, the sewerage was not commenced until 1856. It, however, progressed steadily after that date, and was entirely completed in five years, at a cost of 52,000*l.*

In designing this drainage, one primary object kept in view was the application of the sewage to some useful purpose, although, in the mean time, it was allowed to flow directly into the River Tay. Accordingly, the whole drainage, so far as practicable, had been carried to one point—the outlet of a sewer previously constructed by the Harbour Trustees, to intercept the drainage of the town, and prevent it from entering the docks or tidal basins. The sewer had a fall of 1 in 400, was 7 feet high by 3 feet 9 inches wide, and its discharging end was 8 feet below the level of mean tide. The sewage discharged by it, in dry weather, measured 2 feet in depth, and during storms, 6 feet. The velocity, in the former case, was 65 feet per minute, and in the latter 116 feet per minute. The drainage had been carried out by a combination of brick sewers and salt-glazed fire-clay socket-pipes, of dimensions suitable for the discharge of the sewage and the flood waters combined. The whole of the brick egg-shaped sewers were provided with invert blocks of glazed fire-clay.

In the course of the paper the statement was made that no ventilation whatever had been applied to the sewers in Dundee, and none was contemplated; for although a length of thirty miles of main sewers, and nearly as many miles of branch drains, all closely trapped, had been in use for several years, not a single complaint had been made regarding foul emanations from them. The sewers were kept free of all silt, except sand, by the flow of the ordinary sewage and rain-fall, regulated by the flushing gates, so that no putrescent substances were retained in the sewers or drains, to fill them with deleterious gases, and to poison the inhabitants. It was believed it was only where sewers were badly constructed, as regarded their form and water-run, that putrid matters were retained in them to bring disgrace on the very name of drainage. It was thought that no sewer under 10 feet in height ought to have an invert of more than 9 inches radius, and that a radius of 6 inches was quite large enough for the invert of any ordinary sewer. When the sewage was confined to such a small compass as this, its scouring power was very great; and if care were taken to have the invert blocks laid to a straight line, there would be but little silting, even with a slight fall.

In conclusion, it was stated, as the result of the drainage of the town, so far as could at present be ascertained, that as compared with former years, a decided decrease had taken place in the rate of mortality.

The second paper read was a "Description of the Sewerage and Drainage Works at Newport, Monmouthshire," by Mr. Alfred Williams.

It appeared that, prior to the construction of the works which formed the subject of this communication, several miles of sewers and drains had been built at different times, but mostly in an imperfect manner, and without regard to any general system.

The plan comprised about seven miles of new brick sewers, varying in height from 14 inches to 4 feet 6 inches, all above 14 inches being egg-shaped and narrow at the invert; with outlet works; also of a sufficient number of entrances with ventilating shafts, and of street gullies. The contract for the works was let to Mr. J. Phillips, and their cost had amounted to 11,862*l.*

The author did not consider it advisable to use stoneware pipes as main sewers, having regard to the circumstances of the town, the existing works, the relative cost of brickwork and pipes, the quantity of *débris* washed from the roads into the sewers, the difficulty of preventing improper interference after construction, &c. Under the Newport contract, the cost of radiating brick sewers 14 inches diameter and 4½ inches thick, at a depth of 10 feet, with a junction-pipe for every house, was 7*s.* 7*d.* per lineal yard. This was about the same as a pipe 12 inches diameter, well laid, with junctions. Sewers 2 feet 6 inches by 1 foot 10 inches, of brickwork 4½ inches thick, similarly constructed, and large enough for a man to pass through, cost 11*s.* per lineal yard. The author generally recommended brick sewers not less than 2½ feet high for all important lines, excepting where the fall was very great; and he confined the use of pipes to house-drainage, for which they were admirably adapted, to short branch sewers on steep inclinations, and to conduits for fresh water.

The rate of mortality in Newport in 1850, previous to the adoption of the Public Health Act, was 30·3 per thousand, whilst for the two years ending Michaelmas, 1861, it was rather less than 20 per thousand, or below the average of England and Wales. This very large decrease was no doubt due, under Providence, to efficient drainage and water-supply, to the prevention of overcrowding, and to other sanitary measures.

BRISTOL SOCIETY OF ARCHITECTS.

On the 12th instant, this society held its first ordinary meeting for 1863; Mr. Gabriel in the chair.

The hon. secretary, Mr. E. W. Godwin, explained the adjournment of the last two ordinary meetings. He said the papers promised by the president and Mr. Clark were, of course, not to be expected in the midst of their domestic afflictions; and the long-promised paper on fenestration, by Mr. Lysaght, was again put off by the author only a day or two ago. Under these circumstances he felt himself again bound to come forward with a paper rather than that the ordinary meeting should fail for want of a subject for discussion. He then read a memoir of the destroyed monasteries of Bristol, with some reflections on the present state of art. In the course of the discussion at the conclusion of the paper,

Mr. J. B. Atkinson called in question the assumed connexion of Gothic and Classic, and held that the monstrous births of new styles in the present day was one of the results of false eclecticism.

PROVINCIAL NEWS.

Leiston (Suffolk).—The Works Hall, at Leiston, which has just been erected, in the Italian style, at the expense of Mr. Richard Garrett, has been opened. The new hall, which measures 74 feet by 34 feet, will be used for different gatherings, and specially for the drill of the 9th Suffolk Rifle Corps, under the command of Capt. R. Garrett, jun. Two smaller rooms above have been devoted by the proprietor respectively to the Mechanics' Institute and to a committee-room, besides providing for the comfort of the workmen who live at a distance, giving them all the appliances of a home for their meals.

Leicester.—A warehouse is about to be erected for Mr. C. Noon, on a plot of ground adjoining the Temperance Hall, in this town. Mr. Millican is the architect. Mr. Firn's tender has been accepted for the work appertaining to the bricklayer, &c.; and Mr. Clifton's for the carpentering. Mr. Firn's estimate is 3,079*l.*, and Mr. Clifton's 2,378*l.*

making a total of 5,457*l*. The lowest of the whole tenders is that of Mr. Osborne, which is 5,464*l*. The following are the tenders:—Whole tenders: Slap (London), 7,171*l*.; Dennett (Nottingham), 5,999*l*.; Wykes, 5,989*l*.; Bland, 5,900*l*.; Neale, 5,900*l*.; Porter, 5,660*l*.; Osborne, 5,464*l*. Tender No. 1, bricklayers, &c.: Slap, 3,924*l*.; Wykes, 3,232*l*.; Firn, 3,079*l*. Tender No. 2, carpentering, &c.: Slap, 3,247*l*.; Dennett, 2,912*l*.; Wykes, 2,757*l*.; Jarrom, 2,430*l*.; Clifton, 2,378*l*.

Aldershott. — The foundation-stone of the Aldershott Mission Hall, or Soldier's Home, was to be laid by the Right Hon. the Earl of Shaftesbury, on the 11th inst. The institution is intended to supply the means of quiet recreation and instruction to the troops, in addition to providing amusing reading, and facility for chess, draughts, and similar games. Refreshments, of a harmless character, will be sold at the Home at a moderate rate; and the whole undertaking, which has been originated by a philanthropic lady, is intended to counteract the demoralizing tendency of some of the places of public entertainment in the vicinity of the camp to which the troops resort in their leisure hours.

Rodbourne Cheney (near Swindon).—We are asked to state that Mr. Mantell, of Swindon, was the architect of the new vicarage-house here, and not Messrs. Money & Sons, as might be inferred from a recent incidental notice of it while describing the school-house recently opened at Rodbourne.

Wolverhampton.—The Agricultural Hall, which is being erected by a company, is nearly completed, and occupies a prominent position on Snowhill. It is intended by its projectors for use as a corn exchange, and for the display of agricultural implements. The building covers a space of 1,200 square yards. The large room is 160 feet long and 60 feet in width. It is lighted from the roof by means of three rows of colourless rough plate-glass, manufactured for the purpose by Messrs. Chance; the object in selecting this description of glass being to secure a uniform light throughout the building. The roof, which has been made intentionally low, is supported on eleven principals, with circular laminated ribs, having a radius of nearly 30 feet. The distance from the floor to the eaves of the roof is 20 feet, and to the apex 40 feet. At either end of the room are three windows for increasing the light afforded by the roof. One portion of this room is intended for the farmers and dealers, and the other for the exhibition of implements. Adjoining the large hall is an apartment, 40 feet long by 26 feet wide, designed for use as a settling-room; and there is also a sack or store room. The yard contains closets and other conveniences for persons attending the hall. The chief entrance to the building fronts to Snowhill, the façade being of Italian design, carried out in Bath stone. There is a spacious entrance-hall, and on each side of the door are convenient offices. It is proposed that at a future time the portico shall be surmounted by a clock-turret. For the present, however, it will be terminated with a recessed arch, containing an agricultural emblem, indicating the purpose of the building. The other entrance to the hall faces the Cleveland-road, and will be used for the admission of implements. The floor of the interior of the hall is boarded, and flues are laid underneath for warming the room with hot water. The building will be lighted with gas, the large room by means of twelve star lights of thirty jets each, suspended from the roof. The outlay incurred in the erection will be about 2,000*l*. The design was furnished by Mr. J. R. Veall, of this town, architect; and Mr. G. Heveningham is the contractor for the execution of the works.

CHURCH-BUILDING NEWS.

Littlehampton, (Sussex).—Galleries have been erected in the Congregational Chapel of this place, from the designs of Mr. J. G. Stapelton, jun., architect. Light iron columns, with floriated T shaped caps, support the trusses. The purlins between are trussed. The fronts are light iron, supplied by Messrs. Walter, Macfarlane, & Co., of Edinburgh, the design of which was exhibited by them at the International Exhibition. The whole of the works have been executed for 236*l*., by Mr. Snewin of the same place, and by the addition 200 sittings have been obtained.

Worthing (Sussex).—Mr. Blaker, of this town, having sent in the lowest contract for building the Roman Catholic Chapel about to be erected here, his tender has been accepted. It is said to be somewhere about 1,250*l*. The edifice is to be constructed of Bath and Pulborough stone, and flint, and will be designed in such a manner as to permit of the easy addition, at a subsequent date, of chancel and transepts. The structure will occupy an area of about 70 feet by 24 feet.

Clifton (Beds).—The works undertaken for the enlargement and restoration of the church here are fast drawing to a close. They have been carried out from designs by Mr. Edward Haycock, architect, of Shrewsbury. The carving has been performed by Mr. Sansom.

Bacton.—The roof of the nave of Bacton church was recently found to be in a dilapidated and dangerous state. It has now been repaired and straightened; many new timbers, bosses, and carved spandrils have been added; and iron bolts and straps now hold it altogether. The wall plates have been renewed, and harmony has been made with the old red brick and flint arches of the clerestory windows by the use of an ornamental red brick cornice beneath the eaves. The roof has been covered with new green slates. By the use of a scaffolding, contrived by Mr. Elliston, of Ballingdon, builder, the whole of this restoration has been effected without depriving the parishioners of the use of the church. The eastern bay of the nave had distinct remains of ancient colour in patterns upon the timbers. These have been renewed in the old colours, by Mr. Osborne, of Bacton, at the expense of the rector, and under the direction of the architect. This painting was formerly harmonized by stained glass in the clerestory and other windows, which have now only white glass in them. It has been remarked by several persons that the whole roof should be painted; but the rector and churchwardens dissent from this view. It is intended to re-pew and otherwise restore the church.

Hereford.—We understand that the restorations and repairs of this cathedral will soon be completed, and that it is intended to celebrate the event on the 25th of June. The organ is to be removed, and a large sum of money laid out on it.

Wharram-le-Street.—The parish church of this village has been repaired and re-opened. The work of restoration has been done at the expense of Lord Middleton. Stall seats have been substituted in lieu of the old ones, and additional accommodation has consequently been provided; the church now being capable of seating one hundred and twenty persons; being an increase of fifty. The flooring is tiled, and the edifice is heated with Mr. Wood's hot-air apparatus, the cost of which was 20*l*. The roof is covered with Staffordshire tiles. The architects were Messrs. J. & W. Atkinson, of York; the contractors, Messrs. Wood & Gibson, of Malton. Mr. Smiddy, of Malton, undertook the plumbing and glazing, Mr. T. Reed the iron work, and Mr. Severs the painting.

Lullington.—The sequestered parish church of Lullington, near Frome, after having undergone complete restoration and some extensions, has been re-opened. The work of restoration has been carried out by Mr. Jones, of Bradford-on-Avon. The west end has been lengthened, and the old decayed pews have given place to open benches. The architect was Mr. T. H. Wyatt, of Wilton, the Salisbury diocesan architect; and the entire expense has been defrayed by Mr. William Duckworth, of Orchard Leigh, the patron of the living. The organ is by Messrs. Hill & Son, of London.

STAINED GLASS.

St. Anne's, Soho. — The large stained-glass window by Messrs. Hughes & Ward, which formed part of the International Exhibition, has just been set up in St. Anne's Church, Soho.

Little Rissington Church (Gloucestershire).—A painted glass window of three triplet lights has been recently placed in the chancel of Little Rissington Church, in memory of the late Rev. R. Wilbraham Ford, his wife, and youngest daughter, by the sons and daughters of the late rector. They represent seven events of the life and passion of our Lord,—"Our Lord bearing the Cross," "His Baptism," "The Last Supper," "The Crucifixion" and "Ascension of our Lord," "Christ appearing to St. Mary Magdalene," and "Christ at the Well of Samaria," upon a mosaic ground. This memorial is the work of Messrs. Lavers & Barraud, of London.

Newark Church (Notts).—Upwards of 798*l*. have been obtained towards a memorial window in the Newark parish church.

Sowerby Church (Yorkshire).—A window of stained glass has just been inserted in the north transept of this church. The window has been erected by Mrs. Flavell, of Keswick, in memory of deceased members of her family. The window represents the baptism of Christ, and the symbols of the four Evangelists.

Horsley Church.—A window of stained glass has been placed in the east end of the old church: the gift of Mr. J. Davenport, in memory of his grandfather, the Rev. Samuel Davenport. The window was executed by Messrs. Clayton & Bell, of London. In it our Lord's crucifixion is illustrated, in three compartments. The first gives his coming and finding his disciples asleep; the second, his crucifixion; the third, Mary Magdalene weeping at the sepulchre.

Manchester Assize Courts.—At the Manchester Assize Courts, now being erected, the windows having a northern aspect are being filled with stained glass. That in the drawing-room of four lights, furnished by Messrs. Heaton, Butler, & Bayne, of London, is heraldic in design, the heraldry representing the arms of the United Kingdom, with shields enclosed in coloured wreaths. The stained-glass window in the breakfast-room is supplied by Messrs. Edmundson & Son. It is of five lights. The centre represents a full figure of Justice, and the other four lights have each two medallions, containing busts of four lord chancellors; viz., Lords Wykeham, Moore, Bacon, and Somers: and of four judges; viz., Gascoigne, Coke, Hale, and Mansfield. On bands running diagonally are mottoes, illustrative of the power and the justice of the law. Five quatrefoils in the upper part of the windows are filled with the arms of the Duke of Lancaster and those of Earls Ducie and Derby, as representing the territorial interests of the hundred: the other two give the arms of the boroughs of Manchester and Salford, each surmounted by a civic crown. Three windows in the dining-room are being filled with stained glass by Messrs. Lavers & Barraud. They consist chiefly of conventionally-treated foliage, into which are introduced the emblematic flora of the United Kingdom.

St. Mary's, Oldham.—A stained-glass window has been erected in St. Mary's Church, Oldham, to the memory of the late Mrs. Blackburne. The subject is the "Parable of the Talents." Messrs. Heaton, Butler, & Bayne, of London, were the artists.

St. Anne's Church, Dublin.—A handsome memorial window has been erected in this church by the subscription of the friends and admirers of the late eminent physician, Dr. William Cusack, at the north side of the apse. Over the arch of the window is the inscription, "I am the Resurrection and the Life," and the designs are intended to illustrate this text. In the upper tracery is the Resurrection of our Lord himself—the figure clothed in white, and bearing in his hand the banner of victory over sin and death. Beneath are the two angels in white guarding the sepulchre, and in front the two soldiers, "the keepers, who for fear of Him did shake, and became as dead men." The lower part of the window represents, in four panels, first, "The Raising of Jairus's Daughter;" second, "The Raising of the Son of the Widow of Nain;" third, "The Raising of Lazarus;" fourth, "The Raising of Dorcas by St. Peter." Under the window runs a brass plate, bearing the simple, unostentatious description:—"In memory of James William Cusack, M.D., born May 26, 1778, died September 25, 1861." In the body of the church, on the south side, there has been also set up a similar window, in memory of the late Mr. Charles Smyth, of St. Stephen's-green. To him and to his wife, the filial piety of their sons has erected this memorial. The window illustrates the legend which is inscribed on it—"And now abide faith, hope, and charity; but the greatest of these is charity. The artists are Messrs. O'Connor, of London. In the east wall Messrs. O'Connor have also just put up an elaborate mural brass tablet, which is erected to the memory of the late Mr. Charles Ferdinand Smyth, by his widow. The same artists are engaged upon another memorial window, to the late Chief Justice Doherty, for St. Anne's Church also.

Church in St. John's, Newfoundland.—Two windows have been designed and executed by Mr. Evans, of Shrewsbury, for a church in St. John's, Newfoundland, under the incumbency of the Rev. John Pearson. Each window contains a figure, the proportions of which are the size of life: the one being a representation of the Virgin Mary, and the other of the Apostle Peter.

GROSVENOR HOTEL COMPANY.—At the half-yearly meeting of the proprietors held last Saturday, after putting by 812*l*. towards a sinking fund to meet depreciation and renewals of furniture, and 704*l*. as a reserve, a dividend at the rate of 10 per cent. per annum was declared.

ACCIDENTS.

Fall of Brickwork in Malvern Tunnel.—A portion of the roof of the Malvern tunnel of the Worcester and Hereford railway has given way. The tunnel is a long one, covering a single line of rails, and runs through the Malvern range of hills at a point near to the Wyche; and although it is newly-built, yet for months past workmen have been engaged in repairing it, and rendering it more secure. It is bricked, and a portion, though a small one, of the roof has just fallen in, followed by a quantity of earth. A large fall of brickwork occurred some short time ago. The tunnel, says the *Birmingham Journal*, is again reported as being perfectly safe—*i. e.* until such-like slips shall again occur.

Fall of a Lime-kiln.—An inquest has been held before the coroner for Birmingham, on the body of a labourer, who resided at Halesowen. Deceased was engaged loading a cart with lime from the kiln, upon Halesowen Wharf, when the wall on the north side fell in upon him. A verdict of "Accidental death" was returned. The cause of the falling of the kiln is supposed to have been recent rain weakening its foundation.

Dunoon Church nearly destroyed by Lightning. The west coast of Scotland has been visited by a frightful storm of lightning, rain, and wind. At Dunoon, down the Clyde, the parish church was struck by the lightning, which threw down one of the turrets of the steeple. One huge square stone fell through the roof and the gallery of the school-house, and was buried in the floor almost out of sight. Most of the windows of the church were driven out, and the gas-pipes wrenched, the window-sills split and broken, some of the large stones at the bottom of the walls driven in out of their places, starting and tearing off the skirting, and the copings of the pews were displaced. Several tombstones in the churchyard were broken by the falling stones, and an old monument from Iona was destroyed. It was feared at the moment by some of the residents of the locality that "the end of the world had come."

Gable blown down at St. Andrew's.—Part of a gable of a house, now in course of erection in Queen-street, St. Andrew's, by Mr. M'Intosh, builder, was blown down by the wind. The gable had just been finished, and the workmen had, it seems, apprehended the probability of some such accident, as they had it propped up with large planks of wood, &c.

THE STAGE.

Royal English Opera, Covent Garden.—In the necessarily brief accounts of new operatic and dramatic works to which we confine ourselves, when we point out the weak parts of a production the character of the notice becomes more depreciatory than would be the case if greater length allowed other portions to be dwelt on. If, for example, we were to say why we thought Mr. Bridgeman had not made the most of the groundwork for the "Armourer of Nantes," *Marie Tudor*, that amongst the characters there was not more than one for whom the audience could possibly entertain any regard, that the management had not avoided anachronism in the scenery, and so on, we should overbalance the expression of our opinion that the opera contains some of the best dramatic music that Mr. Balfe has ever written, and, as a whole, affords a very charming evening's amusement. This we wish to avoid. Miss Anna Hiles is altogether unequal to the part of *Anne Duchess of Brittany* (who takes the place of Queen Mary in the original); but with that exception, the rest of the opera is admirably performed, Mr. W. Harrison, Mr. Santley, Mr. Weiss, Mr. Corrie, Mr. Aynsley Cook, and Miss Louisa Pyne supporting the principal parts. In the first act we should especially point to Miss Pyne's cavatina, "Oh, would that my heart;" the duet, "Were all the earth's vast treasure;" Mr. Santley's barcarole; and the duet between that gentleman and Mr. Harrison at the end of the act: in the second, to the duet "Vast as the ocean," and the ballad "There's one who reared me, loved me:" and in the third act to the ballad, "Oh, love, thou'rt like a reed bent low." To justify what we said as to the scenery it will be sufficient to note that while the time of the action is 1498, the scene for the second act is a hundred years more modern. The last scene, a Norman vaulted chamber, with a balcony beyond, and looking out upon the court-yard of the castle, is very effective and well painted. The opera is sure of a run, and deserves it.

The Princess's Theatre.—Spain is the country in which Mr. Filmore has laid the scene of his *very* "Romantic Drama," "The Winning Suit," wherein kings and princesses trot about the country in a remarkably free and easy manner, but, nevertheless, disport themselves very much to the amusement of the audience. Mr. Vezin, Mr. H. Marston, Mr. Belmore (one of the best low comedians on the stage), Miss Murray, Mrs. Marston, and Miss Amy Sedgwick support it. There is some very good writing in the piece—better than has been heard for some time. Mr. F. Lloyd has painted a capital scene for the third act, the Village of St. Lucia, including the porch of a Norman church (too English), and a distant view of the country. A ruin of a Moorish building introduced at the side of the river, in which it is reflected, has an excellent effect.

THE BUILDING MATERIAL IMPROVEMENT COMPANY.

UNDER this title a Company has been formed, according to the terms of the prospectus, to secure to the building public inventions of practical utility and economy, and to provide the capital necessary for the purchase and development of such only as are proved to be valuable; and they propose to commence operations by the manufacture, on an extensive scale, of a substitute for lath and plaster for covering walls, ceilings, and partitions, called Dixon's "Patent Dry Laminæ," already used in many works for nearly two years. The board of direction consists of four architects and one engineer.

Several advantages are claimed for the material with which they are now concerning themselves, and some of these are obvious. It is light and strong, and may be done with a saving of time and money, they say, as compared with the ordinary method of plastering. Whether or not the setting coat used to finish it would always prevent the joints from making themselves obvious we do not know. As to the constitution of the direction we doubt if it be wise for architects to become commercially interested in the sale of building materials. Indeed, if we are not mistaken, it is incompatible with the rules of the Institute. Apart from this, however, the object of the Company seems a good one, and may be carried out with advantage to the community.

CAST-IRON COLUMNS.

YOUR correspondent, who inquires for a formula for hollow cast-iron columns, will find it given in Mr. Hodgkinson's work on cast-iron, published in 1846, from which all subsequent writers on the subject have quoted. His formula is (p. 334):—

$$\text{Strength in tons} = 44{\cdot}3 \times \frac{D^{3{\cdot}6} - d^{3{\cdot}6}}{l^{1{\cdot}7}}$$ where D and d are the external and internal diameter in inches, and l is the length of the column in feet. In order to aid in the calculation of this formula tables are there given of values of $d^{3{\cdot}6}$ up to 12 inches diameter, and of $l^{1{\cdot}7}$ up to 24 feet length; but the formula is intended to apply to columns of higher dimensions; and in every particular case that may occur it is only necessary to perform a simple logarithmic calculation.

Your correspondent will find the above formula given at p. 674 of the *Builder*, vol. xix.; and also more fully explained at p. 532 of the *Builder*, vol. xi. If he is unable to apply the formula himself to the column whose strength he wants to know, I shall be happy to do so for him if he will state the external and internal diameter, and the length of his column.

E. WYNDHAM TARN, M.A.

THE ARCHITECTURAL ASSOCIATION AND THE VOLUNTARY EXAMINATIONS OF THE INSTITUTE.

SIR,—As one of the successful candidates in the class of "proficiency," in the late Voluntary Architectural Examination of the Institute, and a member of the class of Design at the Architectural Association, I must say that there appear to me no sufficient grounds for the statements made by your correspondent "T. R. S.;" viz.,—that the studies of the class of Design, and the proceedings at the ordinary meetings, have had their due result in helping to fit its members to take a position alike honourable to themselves and to the body to which they belong.

Now, sir, my reasons for differing from your correspondent are as follows; viz.:—On referring to the prospectus issued by the Institute, it will be found that a candidate must obtain half the number of marks allotted to the division, "Materials and Construction," subjects to which the class of Design is almost a stranger. The class may, and, doubtless, does, help its members in the art of design; but is not this a thing which may be as easily attained at home, it being merely a matter of practice?

And, furthermore, I would ask "T. R. S." whether he thinks such lectures as are usually delivered at the ordinary meetings are likely to afford much instruction to the student in such subjects as Physics and Professional Practice?

I think the time taken up by some of the lectures would be far better employed in attending to those subjects which may prove *truly beneficial* to intending competitors for next year's honours.

There is, I understand, a sub-committee appointed to investigate the working of the Association; and I think that most of the members will agree with me that this is at the present moment a very proper subject to take into consideration.

H. M.

*** This note represents the opinions expressed in three other communications on the subject addressed to the *Builder*.

"LONDON ARCHITECTURAL SOCIETY."

I HAVE the volume alluded to before me, which belonged to my late father. It is entitled, "Essays of the London Architectural Society. With four plates. Published by order. London: sold by J. Taylor, at the Architectural Library, No. 59, High Holborn. 1808." 8vo. It commences with a preface of six pages; then follow the "Rules of the Society, instituted 1806;" then a list of members, which is as follows:—

"Mr. Aikin, Bartlet-buildings, Holborn.
Mr. Ashpitel, Throgmorton-street.
Mr. S. Beazley, Duke-street, Westminster.
Mr. Billing, Reading, Berkshire.
Mr. Birkhead, Robert-street, Adelphi.
Mr. Bubb, Francis street, Tottenham-court-road.
Mr. Busby, Queen Ann-street West, secretary.
Mr. Cond, Strand.
Mr. J. Elmes, College-hill, vice-president.
Mr. H. Elmes, College-hill.
Mr. Lowry, Pitchfield-street.
Mr. Peacock, Finsbury square.
Mr. Perry, Lombard street.
Mr. Savage, Throgmorton-street, vice-president.
Mr. Schnider, College-hill, treasurer.
Mr. C. South, Upper Pitchn. d-street.
Mr. G. Smith, Doctors' Commons.
Mr. J. Taylor, High Holborn.
Mr. Wallen, Welclese-square.
Mr. J. Woods, jun., George yard, Lombard-street, president."

Then follow the four essays already named by you, occupying 139 pages. The work is complete, as it finishes with the "Finis" usually affixed to books at that period, but there is no treatise on Grecian Doric, alluded to by your correspondent.*

It would be a great gratification to myself, and I am sure to the profession at large, if the traditions of the society could be collected. My father, who was a pupil of Alexander's, and at that time in partnership with Mr. Savage (Ashpitel & Savage, Throgmorton-street), took a great interest in it; but, beyond some general anecdotes of individual members, the only tradition I remember to have heard was this:—It was the palmy days of pure Classic architecture; and some of the members tried also to revive the Classic drama. My father and Savage painted the scenes; but the success of the experiment in other respects was not great, as is often the case with amateurs. Can any of your readers furnish us with further information? I am sure it would be cordially received.

ARTHUR ASHPITEL.

ROT IN ROOF OF LOWER TOOTING CHURCH.

HAVING recently had occasion to supervise some alterations for ventilation in the roof of Tooting Church, I was led to examine the state of the timbers generally, from unmistakeable vermicular signs; and my survey discovered to me a very extensive and complete decay of some of the principal timbers. I applied my cane to some of the ceiling joists, and part crumbled away, leaving the intermediate space of the plastering of the ceiling to be supported only by the lathing. One of the queen-posts is completely eaten up at the foot, the stirrup-iron alone supporting it in its place on the beam.

* This was published separately, as stated by Mr. Woods.—ED.

Now, I beg to ask, what is to be done, short of cutting out the decayed timbers and cauterizing the remainder? or how is the plague to be stayed? Some active remedies should be immediately applied, or the next thing we shall hear of will be a coroner's inquest on some victim.

There are thousands of hungry worms at work, and they bore holes about the size of a tobacco-pipe, and convert the timber into a mere spongy state: a saturation of corrosive sublimate might to some extent affect them, but I fear it would not reach the interior of the timbers where they are at work.

And now—what is the cause of this premature decay? I simply answer, want of ventilation has been the principal one, and probably the only one, as the roof timbers appear to be Memel, and of excellent quality. It is a queen-post roof, and it is framed in the best possible manner, and of full scantlings; but so rapid is the progress of this disease, that to a certainty it will spread to every stick of timber in the church, in a very short time, and the roof must fall in.

An examination into the facts shows that the whole bulk of the roof has been hermetically sealed for years: no perforations whatever existed in the ceiling, and the slating was carefully pointed.

The church had been heated by a hot water apparatus, which, about two years ago, was removed, and a more effectual hot water apparatus was adopted. Considerable oppression or drowsiness was felt by the congregation, and it was found that ventilation was necessary, and holes were made in the ceiling, but that turned out to be of little effect: the outer covering of the roofs then had to be pierced; or, in other words, dormers or louvred openings had to be placed in the slating from within, in order to allow of the escape of the vitiated atmosphere, thus giving some little ventilation and admitting of an exit for the poisonous gases given off by large congregations.

I may remark that the Small Pox Hospital was attacked by dry rot within a few years after its erection, and the diseased parts had to be cut out, by means of which a successful cure was performed.

A. J. HISCOCKS,
District Surveyor of Wandsworth and Tooting.

"PLYMOUTH COMPETITION."

SIR,—I am obliged by your insertion of my letter to the managers of this competition, and shall be glad if you will insert the reply, which I regret absence from home prevented my sending in time for your last week's impression. Fortunately, however, it is not too late for all respectable architects to take the advice so politely tendered by the reverend writer.

J. P. PRITCHETT, Hon. Sec. of the Alliance.

Plymouth, 6th February, 1863.

SIR,—The letter of the 31st ult., addressed by you as "The Hon. Sec. of the Architectural Alliance, which includes associations in every part of the United Kingdom," to John Hill, esq., recommending, for sundry reasons, the issuing of "fresh copies of instructions, with the objectionable points erased," has been placed in my hands, and I am instructed to say, that while the committee appreciate your advice, they nevertheless presume to think that, *in their present case*, the obvious course for any gentleman to take who may be dissatisfied with their instructions is,—not to compete.—I have the honour, &c.,

J. LOUTIT.

J. P. Pritchett, esq.

RIGHT BY POSSESSION.

Hudson v. *Foster*.—This was a case, tried in the Court of Queen's Bench, Guildhall, before the Lord Chief Justice Cockburn, which is worth a brief report as a warning to owners of property not, by neglect or laches, to lose or waive their rights. In 1812 certain land on each side of the Bedford-road, Clapham, was conveyed to the plaintiff and four other persons, as tenants in common; and the action was one of ejectment, to recover a part of one of those portions so conveyed. So far as the deeds were concerned, the title of the plaintiff seemed clear; but for more than twenty years previous to the action the defendant, who was the owner of the land lying behind the piece of land in question, had used it as his own; and now he claimed to have acquired a title under the Statute of Limitations. The action was begun in July, 1861.

Mr. Serjeant Hayes and Mr. Quain were for the plaintiff: Mr. Chambers, Q.C., and Mr. Raymond were for the defendant.

The Lord Chief Justice told the jury that the sole question was whether the defendant had for twenty years had exclusive possession.

The jury found for the defendant.

CAUTION TO BUILDERS INFRINGING THE RULES OF THE METROPOLITAN BUILDING ACT.

RECENTLY several persons were summoned by Mr. Parsons, the district surveyor of the southern division of Lambeth, before Mr. Norton, at the Lambeth police-court, for erecting buildings with bad and insufficient materials.

The first case gone into was that of G. Adamson. The district surveyor said that he would remind his worship that he some months since summoned a man named Parker for using mud in lieu of mortar, and the result was that Parker was fined 10*l.*; and subsequently, upon the officers stating that they had served a distress warrant, and that there were no goods upon which to distrain, he (Mr. Norton) sentenced the man to a month's imprisonment with hard labour. Upon that occasion a person named Green came forward and said that he was the ground landlord, and that Parker had transferred the houses to him: he pledged himself to amend the work, and that there should be no further trouble on his property. Subsequently Parker had come to the court to plead for mercy; and Mr. Perry, the chief clerk, had asked him (Mr. Parsons) if he wished to enforce the sentence. He had replied that his object was to cause the rules of the Act to be complied with; and that if Parker kept out of his district he should ask no questions, but that if he found him at work again he would most certainly have him arrested. He supposed that this leniency had been taken as an indication of want of power; for since that he had had much trouble with the buildings on Green's plot. Green had put forward men to give him (the district surveyor) notice, ostensibly as builder; but they were never to be seen; and Green was really the builder. He (the district surveyor) had proved one case against Green, for which Mr. Norton had inflicted a fine of 5*l.* as penalty for not giving notice.

Adamson had given notice for twelve houses opposite Parker's, eight of which had been built with the upper part of the external walls above the ceiling line of the bed-rooms of half brick in thickness instead of a brick. He, the district surveyor, finding it impossible, after many attempts, to see the man, had sent him a notice in a registered letter, in accordance with the 98th section of the Act. Adamson had written him word in reply, that he had ceased to be the builder. Upon this he, the district surveyor, had summoned Adamson; but when the day of hearing came, the officer of the court stated that he had been unable to serve the summons, as they denied any knowledge of him at the place of residence as stated by him to the district surveyor. Under the circumstances the case was adjourned until a summons could be sent in a registered letter. The district surveyor now asked for an order to amend. Adamson was called, but did not appear, and Mr. Norton granted an order.

The district surveyor then stated that the remaining four houses above named had been built with mud instead of mortar; that he, finding he never could see the builder, had sent him a notice in a registered letter, and had also posted one on the buildings, to the effect that the houses must be taken down; but, instead of complying, every effort had been made to finish the houses since the service of the notice. He produced specimens of the stuff used as mortar.

Mr. Norton said that it was absurd to call such stuff mortar: mortar required certain component parts, lime and sharp sand in well-known proportions. The stuff used appeared to contain little of either. He should therefore make an order that the houses be taken down.

Amongst other cases was that of H. C. Kemplin, who was building four houses on Green's property, opposite Adamson. The district surveyor produced specimens of the stuff used.

Kemplin, on being called on, said that it was all owing to spite on the part of the surveyor's clerk, Mr. Rawlings; that he had never seen Mr. Parsons there; and that he had witnesses to prove that the houses were well built.

John Edge stated he was a bricklayer, engaged in superintending the works. Kemplin asked him if he had seen Mr. Parsons's clerk pick up that morning a lump of mud from the road: he said he had; and, in reply to a question whether he had seen him take a piece from the walls, he said he was not in the building with him.

Mr. Parsons said that, thinking something of this kind might be attempted, he had taken the precaution to send two of his clerks, that one might corroborate the other.

Mr. Norton said he would hear them first.

Mr. W. H. Rawlings and Mr. William Huc accordingly identified the various packets of stuff from the buildings produced.

Edge, in reply to Mr. Parsons, admitted that he had been told by Mr. Parsons himself, when the walls were about two courses over the footings, that he would not sanction such stuff; and that Mr. Parsons had subsequently told him, when the walls were about scaffold high, that they must be taken down and rebuilt.

Mr. Norton said he had gone, at the district surveyor's request, with him to inspect the houses, and that they certainly were as he described. He saw Mr. Parsons with a very little exertion with one hand push down a considerable piece of a wall. In fact, he thought that mud cottages would be better and warmer than these. The district surveyor had his duty to do to the public, and he was doing it; and if he failed to do it he would be subject to censure. He ordered that the walls should be pulled down, and gave a week to do it in.

Kemplin and others have since taken down the obnoxious work. The district surveyor has applied to the Metropolitan Board of Works, under the 68th section, to indemnify him as to costs and results if he proceed *himself*, in Adamson's case, under the 47th section, and pull down the work.

FEES FROM TRADESMEN TO ARCHITECTS.

SIR, The best way to stop the abominable system of fees from tradesmen to architects is to communicate to you the names of those who offer them; and I beg, therefore, to inclose a letter just received by me, and purporting to come from Messrs. Trestrail & Co., makers of kamptulicon, offering me, as architect of a new church, "a discount on any order that I may send."

GEORGE EDMUND STREET.

TUAM CATHEDRAL.

SIR,—Being the "Irish Correspondent" referred to in a letter on Tuam Cathedral in the *Builder* for January 10, I beg to trouble you with a few additional observations on the subject, which would have been forwarded before this, but for the delay in obtaining sketches.

The general character of the eastern portion of the building (my remark on which appears to have been taken exception to by Mr. Deane) is a question, satisfactorily to understand the merits of which requires a personal examination.

The drawings, however (from measurement), which I forward, will, I dare say, sufficiently explain the general grounds on which the antiquity of this portion of the building may be argued.

Whether the windows referred to by Mr. Deane are of an interesting or uninteresting type, is of course a matter of opinion, and does not necessarily affect the question of antiquity. They certainly present a pure and elaborate system of cusping. The east window (of five lights), especially the two easternmost windows, on both north and south sides, are of three lights, the others of two. Those on the south side are altogether perfect, of limestone, and vary in the design of their traceried heads, the outside jambs being formed of double chamfers.

That these stone windows are "the only architectural features deserving of such a name," is a statement which I must beg leave to correct. A few others exist, such, for instance, as a priest's doorway, now built up, but still apparent from its label moulding and the jamb of the opening on the south side. A piscina, which has evidently been a fine example when perfect, divided originally by a small central column, the cusped heads over which, with cusped circle in the spandril, the whole inclosed by a pointed segmental arch, with label mouldings over, still remain open to view, but in a rather mutilated condition. Close by this interesting feature, and in the position usually occupied by the *sedilia*, there exists in the wall, on the authority of the verger, an arch or recess, which, to say the least, is suggestive: if the plastering were removed, I have little doubt but that the moulding of the arches and other architectural features will be brought to light (I may mention that the cut stone work of this period in the building is of hard limestone, and therefore in good preservation, except where broken maliciously, or from carelessness).

In addition to these a complete *chancel arch* is to be seen. This is of a plain character, not unusual in Middle Pointed work, being composed of a series of chamfered rings, five in number; the whole width of the jamb being 5 feet.

This arch, which is the termination westwards of the Middle Pointed work, is built about 6 feet to the east of the Norman chancel, the centre line of each building being identical.

This exact position of the later chancel could hardly have been adopted with no some particular object, and therefore the non completion of the Middle Pointed building leaves it a matter of interesting conjecture as to what may have been the intended arrangement of the building of which the chancel only was carried out, more especially in regard to the disposition of the arch of Romanesque chancel.

The existence of such features as these, which are not generally considered as unimportant, though in the present case apparently overlooked by Mr. Deane, is, to my mind, quite sufficient to settle the question of antiquity, not only of the details themselves, but also of the walls in which they are to be found. It would appear to me most extraordinary, to say the least, that all these features, supposing them to be the *débris* of a former building, should be re-used so consistently for an after structure and built in so exactly in the proper places. Such a theory naturally suggests the question—where this former building existed: and if these are its *débris*, how is it that the windows and chancel arch are so perfect compared with the piscina? And also, at what particular period subsequent to what might be reasonably

taken as the life of a building erected in the fourteenth century, could such care have been evinced in the proper restoration of such things to their original places and uses?

The interior dimensions of the Romanesque chancel are about 18 feet 6 inches by 17 feet 6 inches; those of the Middle Pointed building 71 feet long by 27 feet wide. Which of these, or whether either of them should be removed in carrying out the proposed restoration (?), are points which I should prefer leaving in other hands for discussion, my object being merely to correct statements which appear to me to have been made without due consideration or examination of the existing buildings, and carrying with them all the more weight in emanating from an architect of Mr. Deane's well-known ability and archæological attainments. THOMAS DREW.

Books Received.

Contribution towards a History of Electro-Metallurgy; establishing the Origin of the Art. By HENRY DIRCKS, C.E. Spon, Bucklersbury. 1863.

THE great object of this volume is to show that Mr. Spencer, though one of the earliest improvers on the germ of electro-metallurgy, was not the originator of it. Mr. Dircks maintains that—

"Professor Daniel is the *discoverer* of the principle on which the deposition of compact copper depends; that Mr. C. J. Jordan [of whom a portrait is prefixed to Mr. Dircks's volume] is the *inventor* of the first application of that principle to useful purposes in the arts, known as electro-metallurgy; and that Mr. T. Spencer is the first of the class of *improvers* of this art, so invented."

But in thus distributing the merits of British subjects as regards the origination of electro-metallurgy, what of M. Jacobi, of St. Petersburg? Though his name does not appear in this summary, Mr. Dircks elsewhere acknowledges his part in it; as where he remarks that "in the instance of electro-metallurgy or electro-type, it is by no means singular to find Professor Jacobi in St. Petersburg, Mr. C. J. Jordan in London, and Mr. Spencer in Liverpool,—each one unknown to the other,—engaged on the same investigation." Here, by the way, Mr. Spencer is virtually admitted to be an independent originator of the process, and not a mere "improver" upon any one's origination but his own. In short, all three were joint originators of it even on Mr. Dircks's own showing. Mr. Jordan seems, however, to have been the first to publish some account of it (dated 22nd May, 1839) in the *Mechanics' Magazine* of 8th June, 1839; but Mr. Spencer, then of Liverpool, had written a general notice to the secretary of the Polytechnic Society on 9th May, 1839, that he was engaged in experiments that appeared to accord with those of Jacobi, which had been previously noticed in the *Athenæum*. The preliminary experiments of Dr. Golding Bird, published in the *Phil. Trans. for* 1837, ought also to be here mentioned in connexion with the subject; and that Mr. Spencer appears to have been one of those who were led by these experiments to turn their attention to the subject so early as 1837. Mr. John Dancer, also of Liverpool, was another of these.

VARIORUM.

"Monthly Supplement to the *Electrician*: Telegraphic Guide for February, 1863. Office, 32, Paternoster-row." This very useful Guide gives not only the names of telegraph stations throughout the three kingdoms and all over the Continent, but also the charges for messages of twenty words at every Continental station, the general charges throughout this country, and the times of opening and closing of each British station. There is also a telegraphic map of Europe, the whole surface of it interwoven as if with ganglial nerves, and showing the extraordinary progress of the electric telegraph within the last few years.——"A Treatise on the Culture of the Pine-apple. By Thomas Torbron. Second edition. Allen, Warwick-lane, Paternoster-row." Mr. Torbron states that his little treatise has been founded on long practice. This second edition contains also a plan for the introduction of the vine in the same chamber with the pine-apple, as also a shed for the cultivation of the mushroom; and he thus describes the plan of all three:—

"The plan represents a house 30 feet long, with a pit for tanners' bark 10 feet wide and 3 feet deep, with paths all round the pit 3 feet wide, and with flues round the pit, which, after the entrance of a draught of heat from the furnace, run right and left to the middle of the opposite end, and then divide, and return over the first course of the flues to the chimney in the north wall. A trellis covers the soil for the path. The vines are intended to be planted against the wall at the north end, or against the upright glass at the south end; then trained over the paths on wires at a convenient distance from the roof-glass, so as not to obstruct the perpendicular light from the pines. The plan represents vertical sashes, which are to slide; and shelves are intended for strawberries, hyacinths, tulips, pinks, and roses, in the forcing season. French beans may be grown on the flues in winter and spring. The shed at the north end represents shelves for mushroom-beds. The warmth from the fire in winter will be favourable to the growth of mushrooms. The shed-section also represents a chimney for the flues by dotted lines. The flues require to be covered with foot-tiles. The ground-plan and section show a 2-inch cavity between the wall of the pit and flues; and the dots in the ground plan show the course of a flue from the furnace to the lower flues."

The arrangement appears to be both convenient and economical.——The second number of the *Sculptor's Journal* is a considerable improvement on the first. It includes an illustration of the "Reading Girl."——The current number of the *Ecclesiologist* contains a paper on Auckland Castle, by Mr. W. Sidney Gibson, with plan and sketches to illustrate it, by Mr. F. R. Wilson.——Messrs. Hogg's series of "Books with a Meaning," is increasing in number, and will form a valuable library for young people presently. Amongst the most recent additions to it is "Our Untitled Nobility," by John Tillotson, with illustrations by Charles Green. The writer sets forth pleasantly the labours and merits of Dr. Smith, the geologist; Waghorn, of the overland route; Raikes; Captain Coram; the Brunels; and poor Cort, to whom for his processes in the iron manufacture the country owes so much and has paid so little. These lives teach that "it is the bravest and best thing in the world to be unselfish."

Miscellanea.

ENGINEERS.—We learn from the *Otago Times* of the 13th ult., that Mr. John Millar, C.E., has been appointed chief engineer of the city of Dunedin, at a salary of 1,000*l.* per annum. The Melbourne papers say:—"Mr. Millar will carry with him the best wishes of all his numerous friends in this colony."

THE MIDDLE LEVEL CATASTROPHE.—The liability of the Middle Level Commissioners to pay compensations for injuries occasioned by the recent floods is to be tested at the ensuing Norwich Assizes; upwards of 100 writs having been served upon the Commissioners. The cost of the various works already undertaken, excluding altogether the question of compensation, amounts to nearly 100,000*l.*

AN INTERNATIONAL PARCELS DELIVERY COMPANY.—"The Factage Parisien Paris General Parcels Post and International Carrying Company" is a new company, with a capital of 200,000*l.*, in 20*l.* shares, which is being got up both in Paris and in London, for the conveyance of packages between Paris and London, all parts of France, and throughout Europe as well. The projectors have already obtained a concession from the Prefect of the Seine and the Paris municipality, with liberty to form some eighty or ninety distinct stations or offices in Paris, and to load and unload in a way not hitherto allowable in that city. The shares have been partly disposed of in Paris, and are now being disposed of in London. The company have received favourable communications from the Great Northern, Great Western, and London and Dover directors; and Sir Cusack Roney, one of the directors of the London and Dover, Mr. L. Simpson, a director of the Great Eastern, and Sir James Carmichael, bart., chairman of the Submarine Telegraph Company, are directors of this International Parcels Delivery Company, which appears to be a very promising speculation, as the fact of its shares being already at a premium seems also to show.

THAMES EMBANKMENT: NEW STREET.—Mr. Cowper has obtained leave, after some discussion in the Commons, to bring in a Bill to authorize the Metropolitan Board of Works to make a new street from the termination of the Thames Embankment at Blackfriars Bridge to the Mansion House, thus completing the new thoroughfare from Westminster to the City. One of the most urgent wants of the metropolis, he remarked, was a thoroughfare connecting the central parts of the City with Westminster and Charing-cross. At present there was thrown into Cheapside not only the traffic which reached it by the Strand, but the traffic which came from the north-east of London by Holborn. What was absolutely required was a new and distinct thoroughfare which would enable persons to pass from the centres of commercial activity about the Mansion House, the Exchange, and the Bank, to the points of Charing-cross and Westminster. The cost of the works was estimated at 600,000*l.*, to be afterwards provided for, not by direct taxation, but by a continuance of the charges on the coal duties for a further period of ten years beyond 1871, as it was feared the Thames Embankment fund would not suffice for these additional works.

PREVENTION OF FIRES IN THE METROPOLIS.—In reply to Mr. Hankey, in the Commons, Sir G. Grey has announced that it is intended to introduce a Bill this session for the better prevention of fires in the metropolis. It would not, however, be based on the recommendations of the committee of last year, which involved the putting an end to the entire system as it was now carried on.

THE PNEUMATIC DESPATCH COMPANY.—This company now proposes to extend its sphere, as well as its means of communication. The tubes are to be enlarged to 4 feet, and are to be arranged for the conveyance of such passengers as may venture on this mode of transit, as well as for packages and parcels. The proposed line is to have stations at Camden Town, the General Post-office, Covent Garden, and the City; and is to be about five miles long, and to be completed within a year.

CURIOUS DISCOVERY AT POMPEII.—A Naples letter states that a very interesting discovery has just been made by M. Fiorelli, the inspector of the excavations at Pompeii. He has found in hardened ashes the perfect mould of a man in a lying posture, and the skeleton entire. M. Fiorelli caused plaster of Paris to be poured into the form of the Pompeiian, and the coating succeeded perfectly, with the exception of two fragments of an arm and a leg, where the mould was incomplete. The cast of the man is of the greatest precision: the moustache, the hair, the folds of the dress and the sandals are all admirably defined. The famous question of the Thesaurum of Gronovius and Grevius, says *Galignani*, in reporting this discovery, is now decided: the Romans did wear drawers. Also archæologists will be delighted at discovering the manner in which the ancients fastened their sandals, and at seeing the heel of a shoe completely protected with iron.

CHESTER TOWN-HALL.—At a recent meeting of the committee of council for restoring or rebuilding the Town-hall, Mr. Holme, of Liverpool, builder, reported on the state of the edifice since the fire. Mr. Holme says, in his report, "I acknowledge a strong inclination to preserve, if possible, an edifice so much in accordance with the general architectural character of your venerable city; but the destruction has been so great, the damage so extensive, and the reasons against repair are so formidable, that I am decidedly of opinion you would not be justified in any other course than taking down the existing ruins, and erecting a new structure. . . . The only conclusion at which I can arrive is, that it is your best economy to take down the whole of the existing structure, and to re-use the materials, as far as they will go, in the erection of an entirely new building. It is going beyond the letter of my instructions, but I hope that I shall be pardoned for suggesting that, should you adopt my conclusions, instead of rebuilding on the present contracted site, the opportunity is favourable for considering whether an edifice which was suitable in the reign of Queen Anne is sufficient for the present day and for the growing population and trade of your city and its vicinity. And also, whether you may not, with great public advantage, embrace this opportunity of centralizing all your municipal and various other public offices and establishments under one roof."

THE PROPOSED ADDITIONAL WATER SUPPLY FOR ROTHERHAM.—The Sheffield Town Council's Sanitary Committee have resolved to resist the Bill in Parliament for increasing the water supply of Rotherham and Kimberworth by collecting the water from various brooks, on the ground that the diversion of so much water from the Don will materially reduce the supply of the borough. A correspondent of our own, dating from St. John, and signing himself "A Rotherham Ratepayer in the West Indies," also protests against the scheme as unnecessarily costly. He is urgent that the supply should be improved; and, indeed, as our readers may remember, wrote to us before on the subject; but knowing the locality and what is meant to be done, he maintains that besides the 27,000*l.* admittedly all but thrown away already on the water supply, the new scheme will cost not less than 20,000*l.* more. He proposes that water should be taken at once from the Rother above Carlton Mill, and thus save so many scattered reservoirs and other costs; and, looking to the quality of the water, he thinks that from a small stream like the Rother, rising in high lands, and not much subject to contamination, the supply might be made unobjectionable. The present supply, he says, is partly gathered from perforated pipes laid almost side by side with the sewers to catch the springs there; and sewage, he conceives, may have percolated into the water supply, and assisted in producing the epidemic.

TURKISH POSTAGE STAMPS.—Turkey has just issued postage stamps, having long been the only Power in Europe that had not adopted that mode of paying for letters. The Turkish stamps are of four different colours, and all bear the signature of the Sultan Abdul-Azizi; the Mahomedan religion interdicting the representation of the face or person.

EFFECT OF SUN ON OIL PAINTINGS.—A correspondent writes from Stuttgardt, stating that Wilkie's picture, "The Reading of the Will," which was purchased for the gallery of the King of Bavaria at the sale of the late Earl of Mulgrave's gallery, is exposed to the sun's scorching rays, which have as it were melted the oil or colours, and also very much affected the tone of the colouring; and that there are cracks nearly one-eighth of an inch apart in many parts. It should be looked to.

BRIGHTON DRAINAGE.—We understand from the local *Herald*, that a meeting recently took place in the town-hall, at which the works committee,—assisted by their consulting engineer, Mr. Hawkesly,—and Mr. Somers Clarke, and the chairman and a deputation of the drainage committee, with Mr. McClean and Mr. Wright, the engineers, were present; when several inquiries were made of the latter gentlemen as to the details of their plan of drainage for carrying the sewage of the town beyond Rottingdean; and, after a discussion which lasted nearly three hours, it was arranged that certain other engineering points and questions relative to the proposed design should be prepared by Mr. Hawkesly for the works committee, and submitted to Mr. McClean and Mr. Wright for their elucidation and answer.

PHOTOGRAPHIC STATISTICS: INTERNATIONAL EXHIBITION.—Some very interesting statistical facts relating to the immense consumption of photographic chemicals by the London Stereoscopic and Photographic Company have recently been made public. The number of glass negatives taken at the Exhibition (from which the paper pictures are printed) amounts to very many thousands:—

The paper used was	300 reams.
Albumen for ditto, about....	280 gallons.
Nitrate of silver.....	4,000 ounces.
Gold	99,000 grains.
Hypho sulp. soda	4,800 lb.

The photographic pictures produced from this immense amount of material are now approaching 1,000,000! Since the close of the Exhibition a new development of trade has sprung up in these photographs. It is reported that the Company received orders on one day for upwards of 11,000 of them.—*Post Magazine.*

POPULAR ERROR REGARDING THE WANT OF UNIFORMITY IN THE THICKNESS OF THE ANNULAR RINGS OF TREES.—On reference to the cross section of a newly-felled tree, it will be observed that the timber has not formed of uniform thickness round the pith of the tree. This is uniformly the case towards the base of the spruce, Scotch fir, and larch. The popular belief is, that the wood forms faster towards the side most exposed to the light and the heat of the sun's rays. Were this the case, it would prove that we have more of these from the south-east than from any other quarter. The prevailing high winds in Britain are from the north-west or south-west, and they usually blow hardest in autumn, when the young wood is most liable to be permanently bent in any given direction. This makes the top lean towards the north-east or south-east; and, by one of the many admirable compensating operations of the Great Creator, the wood at the base grows fastest on those sides, so that it may act as a natural buttress, and maintain the centre of gravity.—*Rait.*

THE NEW ASSIZE COURTS, MANCHESTER.—The new Assize Courts in Strangeways are rapidly approaching completion. The semi-detached portion of the building at the north-west end, and which is to form the judges' lodgings, is completed, except the tiling of the floors and some few details of minor importance. The whole of the main building, except the tower and smaller apartments, is roofed, and the greater part covered in. It is the intention of the committee and their architect to open out the building to the street in the course of a few weeks; so that the boundary-walls and general approaches may be proceeded with. The chief tower has been raised 70 feet above the ground-line; but at this level it has been thought advisable to let the work stand for a few months to consolidate. Mr. Bramall, the general contractor for the building, is making great exertions to forward the progress of the works; and it is hoped that, by the end of the year, the building will be far advanced towards its completion.

THE TEMPLE CHURCH, LONDON.—We understand the Benchers have decided on restoring the conical roof to the "round" of the Temple Church.

THE WOLVERHAMPTON SEWERAGE QUESTION. The Town Council have resolved "That Mr. Carley, C.E., of Hereford, be appointed to examine and report upon the proposed scheme of sewerage for this borough for the sum of 65*l*, and that the town clerk prepare the necessary contract, and affix the corporate seal thereto."

THE COLOSSEUM.—An old subscriber of the *Athenæum*, in reply to a query why the word should be "Colosseum," and not "Coliseum," writes to say that in vol. ii. of the "Lives of the Roman Empresses," p. 50 (edit. Naples, 1768), there is a note which gives the reason for using the orthography as first above given. Referring to the completion of the great Amphitheatre by Titus, the note has the following:—"Nel mezzo dell' Anfiteatro si sorgeva una grande statua rappresentante Nerone, chiamata il Colosso di Nerone, da cui quel luogo prese il nome di Colosseo."

THE OTTOMAN NATIONAL EXHIBITION AT CONSTANTINOPLE.—Goods continue to come in plentifully, particularly from Toulcha, Varna, and Tirnova. Of the metropolitan guilds, the brass-workers, according to the *Levant Herald*, have sent in some creditable specimens of their handicraft, whilst private mechanics have contributed additional models of steam-engines, all distinguished by some peculiarity of construction or intended result. The locally-famed *savant* and numismatist Subhi Bey, ex-minister of the Evcaf, has promised to lend his admirable collection of medals and Ottoman antiquities. From England there are large coming consignments of agricultural implements. The Porte has also directed Musurus Bey to provide from England a complete and varied collection of cotton-gins and other allied machinery. The building was to be opened on the 19th instant.

STATE OF BROMPTON, IN YORKSHIRE.—The district registrar of Northallerton, speaking of the unsatisfactory condition of the district, says,—"Drainage is very bad, and heaps of putrifying filth are allowed to lie close to the dwellings of the poor. I particularly refer to the village of Brompton, where for some time synochus, typhoid fever, and typhus have been very prevalent. Here I find no drainage at all, no proper cesspools; yards unpaved, and dungheaps unremoved; the floors of the dwelling-houses beneath the level of surrounding land; and, what is still worse, the inhabitants appear to have a dread of ventilation. For years this village has been little else than a hotbed of fever, but this fact has not induced the authorities to adopt means of prevention. The mortality of children is excessive. Many infants are, when a few weeks old, left to the care of mere children, going for days without their natural food, but fed on scanty and improper diet. They die literally from neglect."

MORTALITY DURING LAST QUARTER.—The mortality in England and Wales in the last quarter of 1862 was at the rate of 2·226 per cent.: in 1860 it was 2·043; in 1861, 2·061. Though the autumn of 1862 was not as a whole colder than those of 1860 and 1861, the sudden invasion of cold in November, and the abrupt succession of heat are given to account for its having been the most fatal. The Registrar-General in his *Report* says,—The north-western counties, Yorkshire, London, the northern counties, and the west midland are the five divisions in which the highest rate of mortality prevailed. In the first which contains the districts of the cotton manufacture, the rate—2·66 per cent.—was higher than in any other division. This distinction is not of recent birth: it is not the fruit of adverse circumstances, but has sprung from causes which have been in operation since Liverpool, Manchester, and other towns, in what has been called the worst drained part of England, rose into importance as seats of commerce and manufacture. But whatever be the sanitary condition of the towns and villages they inhabit, human beings must be affected by the atmosphere in which they are immersed, and the effects of which they can but partially control; and as the cotton districts participated with the rest of the kingdom in the benefit of a healthy summer, they have also suffered, like other parts, from a less healthy autumn. . . . Scarlatina and diphtheria, and also diarrhœa, prevailed to a considerable extent in Manchester. An increase of deaths in Ashton-under-Lyne is attributed to scarlatina and measles. Scarlatina caused eighty deaths, being a third part of the total number, in Oldham-above-Town: these occurred not only in the working-class, but in the general population.

NEW CARLISLE BRIDGE, DUBLIN, COMPETITION.—In reply to several indignant competitors, who point out that "it is now twelve months since the designs were advertised for, and over nine months since they were submitted, and yet it appears that no decision has been come to," and who ask for information, we are unable to say anything satisfactory. Some pressure should be brought to bear on the committee.

ALBERT MEMORIALS.—It has been decided, if the corporation concur, to place the Manchester statue in the centre of a new and extended area of buildings at Bancroft-street, to be named Albert-square, which will be between two and three times larger than St. Ann's-square.——Designs for the Abingdon memorial have been submitted by Mr. J. Gibbs, of Oxford, architect, and a committee has been formed and liberal subscriptions already contributed.

EDINBURGH.—The *Scotsman* says that the suggestions recently made for the decoration of the walls of the Great Hall in the Parliament House, by hanging there the portraits, scattered through various parts of the building, of judges and other eminent personages, has been carried into effect. The east wall is now tolerably well clothed by these portraits, and the improvement in the aspect of the hall is very marked. They have been hung under the superintendence of Mr. Charles Robertson, treasurer to the faculty, the larger and the smaller pictures being judiciously alternated and adapted to the nature of the spaces as these are broken up by doors, niches, and statues. There is room for many more, and no doubt time will add to the collection.

RENOVATING FLOWER-BEDS.—If the exhausted beds have a good bottom, we advise removing the top spit, and replacing it with a mixture of virgin earth from an upland mixture, well chopped up with old chippy cow-dung, and a good proportion of leaf mould; say, if you can obtain the quantities, equal parts of each of the three ingredients. If you can get the beds empty this winter, the best way will be to take off the top spit, and fork over the subsoil, so as to let the frost and snow penetrate it; then get a good supply of burnt clay, and hotbed dung, and chop them down together in a ridge, and let them be well frozen, and fill up the beds with the mixture early in March, and they will be in admirable condition for planting as soon as they have settled. Chippings of hedges, refuse wood, straw, &c., built up over a hole, and packed round with cakes of old turf, and then burnt, make a capital dressing to dig into the old soil if you cannot well get new material to replace the worn-out stuff. If used chiefly for bedding plants, a compost of leaf-mould, and sandy soil from a common, equal parts, and one-fifth of the whole very old dung, would prove a good mixture. Bedding plants do not require a rich soil so much as a *new* soil.—*Gardener's Weekly Magazine, and Floricultural Cabinet.*

THE "AURA ELECTRIC GAS LIGHT."—Men of science seem resolved not to rest till something quite resplendent in the form of *light* shall be discovered. As for the merits of the following we as yet know nothing, but it appears to be a step towards the ulterior manifestation of the "new light," for which every one is looking:—"Mr. J. Grosmith," says a contemporary, "claims the application of a new improved radiator, which acts upon a solid, and by the use of multiplied interwoven galvano-electric metals he aërates a liquid, from which light is generated through horizontal arrangements. The inventor claims a new mode of presenting multiplied surfaces, by which he produces a carburetted hydrogen gas, most brilliant and lasting: he employs no fire nor heat whatever, but furnishes an improved apparatus by the cold process of generating gas: he uses no vertical tubes, nor cotton, nor any vertical arrangements of tubes for capillary action. . . . He reserves the exclusive use of his apparatus for every purpose to which it may be found applicable in the carburization of common coal gas, to which it imparts a threefold luminosity; as also in the generation of the aura electric gas. Its advantages are—1. The aura electric light can be used in any house, or large establishment, without fire, retorts, or gasholders. 2. That it gives a more intense light, without smell or smoke: the ordinary gas fittings are available, excepting the burners only. 3. It will cost less by one-half in the whole apparatus complete than that of the ordinary gas. 4. When required for enriching common coal gas, it only has to be passed through a photogenic cylinder, when three times the light is evident, while the consumption of the gas is lessened to one-fourth of its usual quantity. The light may be seen at Mr. J. Grossmith's, 85, Newgate-street."

ELECTRO-TELEGRAPHIC.—At the half-yearly meeting of the Electric and International Telegraph Company the directors' report, recommending a dividend of 3½ per cent. for the half-year, was unanimously adopted.

CONDITION OF LEEDS.—We have noticed with interest the reports of the medical officers of the Leeds commission for ascertaining the cause of the present deplorable state of the health of Leeds. It is rather amusing to see the admissions now made by the doctors, when the howl of indignation is remembered which followed our article two years ago, in which we dared to hint that the whole town was slightly dirty, and not altogether healthy. We shall be amply rewarded, however, if improvements follow.

TRADE LISTS.—The new pamphlet issued by the St. Pancras Iron Work Company (Old Pancras Road) is fully illustrated, especially as to stable arrangements and farm-fittings, and will be found a useful guide as to price.——W. Dawbarn & Co.'s List of Prices (Liverpool) is something more than it professes to be, for it contains a number of useful tables and many items of information. Timber, sanitary ware, slating, masonry, &c., are all included.——The illustrated list of George Smith & Co. (Iron Foundry, Glasgow) describes, amongst other things, their "Dry Deodorising Closets," which in some situations have their advantages.

BACHELORS' CHAMBERS IN MANCHESTER.—A company, with 20,000*l.* capital, is being formed in Manchester, for the purpose of providing a superior class of handsomely-furnished private apartments for bachelors resident in Manchester. A site has been secured fronting the Oxford-road, within a mile and a half of the Exchange, and plans have been prepared, by Messrs. Pennington & Bridgen, architects, for a building to contain from thirty to forty suites of apartments, baths, &c., on each floor, and additional large rooms for dining and other purposes; also, stables and coach-houses attached. It is proposed that the rentals of the various suites (including coals, gas, and attendance) shall range from 50*l.* to 100*l.* a year, thus producing about 3,000*l.* a year upon the capital.

"THE CRUCIFIXION," BY MR. H. C. SELOUS.—This very remarkable picture, now exhibiting at 62, Cheapside, should be visited. It is the most important work yet produced by the artist, and will more than compensate for all the danger of a journey into the City; no trifle now-a days, when a "block" at Bridge-street may keep you there twenty minutes. Mr. Selous has brought the crowd into the foreground: a ray of light from the stormy sky illumines the Crucified Christ in the middle distance: the background is filled with mighty towers, temples, porticoe, and colosseums, idealizing Jerusalem. It is not so much a picture of individual expression as of general sentiment; still amongst the 300 figures which fill a canvas 14 feet long and 8 feet high, will be recognized characters prominent in the life of Christ. We offer our congratulations to Mr. Selous on the successful completion of this arduous and beautiful work.

CHURCH BELLS.—In a late number of your journal is a paper on bells, in which are some interesting remarks. May I solicit a corner for a few lines on the neglect of supplying our new metropolitan churches with this useful appendage in its way? If we turn westward, we find that not one church, from St. Giles's (close by the bottom of Old Oxford-street) to a distance of three miles, bearing to the right, has a peal, although the steeples to some of them, from their noble proportions and the taste displayed by their architects, warrant their being supplied with this appendage, without which I consider a church steeple like a body without a soul. Near the Edgeware-road is a church tower large enough for a peal of eight of twenty-three hundredweight tenor, which at present can only boast of five, the largest weighing only eight hundredweight. After this we meet not with another church with a peal till we arrive at the foot of Highgate-hill. The art of change-ringing on bells hung to be raised and rung on the balance, the bell making a circle each time the clapper strikes a blow, is exclusively English, and a national auxiliary that has been used for centuries in awakening feelings of joy when rung on particular days during the year. A small subscription among the parishioners would defray the cost of a peal, and a further grant from the rates, not in amount to bear upon their pockets, would secure the services of a set of ringers; and thus, in districts where a stillness prevails, particularly in the evening, a merry peal would enliven the spirits of the surrounding inhabitants.

HAYDN WILSON.

MINERAL COLOURS.—Some valuable mineral paints have, it is reported, been discovered in California, producing respectively the four colours red, yellow, green, and blue. The minerals are chiefly terra sienna, basalite, sienite, and wacke. They are found in the El Hambre Creek, near the town of Martinez.

"NEW LAMPS FOR OLD."—According to a local paper, a portion of the old painting on the roof of the parish church at St. Neots, supposed to have been painted some centuries back, has been taken down and replaced by others, executed after the same style as the original. The more's the pity.

THE OIL SPRINGS.—Canadian papers state that, owing to the sudden and almost universal cessation of the flowing wells, there is quite a panic among the dealers; and until the result of putting down pumps has been ascertained, contracts cannot be negotiated. Much of the paraffine of commerce, however, is got from other mineral sources, and doubtless will continue to be so got, independently of the oil-wells, as it was before they were discovered.

CITY OF LONDON PAUPER LUNATIC ASYLUM. We hear that Messrs. Piper & Wheeler, the contractors for these works, are making rapid progress with them, the whole of the brickwork (with the exception of the chapel) being nearly completed. The roof-timbers are fixed, and the tiling is in a forward state. The tower in the centre of the building is carried up to a considerable height, and the stonework forming the brackets and cornice is now being set. Mr. Bunning is the architect.

PREVENTION OF MINING ACCIDENTS. — Mr. John Phillips has deposited in the Mechanics' Institute a model of an ingenious contrivance for obviating the commonly fatal results from the breakage of shaft gear. The model is somewhat after Fourdriuier's principle, and represents a shaft with projecting board edges. To the bucket are attached spring handles, which, while the rope is at tension by the weight of either the empty or full bucket, are clear of the sides of the shaft, but which, upon a snapping of the rope, spring out, catch hold of the bevelled edges of the shaft sides, and thus arrest the descent of the bucket or cage.—*Ballarat Star.*

DOUBLE-ACTING VENTILATOR FOR RAILWAY AND OTHER CARRIAGES.—An ingenious and simple apparatus for this purpose has been patented by Mr. M. Wigzell, of Topsham, in Devonshire. It is intended to be inserted in a convenient position, such as above the glass slide in the door of the carriage; and may be briefly described as consisting of a double tube put together in a T form, and inserted horizontally, so that the mouth of the inlet tube will open forward on the route of the carriage, while the mouth of the outlet tube opens in the opposite direction. There are of course interior openings, one for admitting the fresh air, and the other for egress of the foul.

LECTURE ON LIGHT AT THE ROYAL INSTITUTION.—Dr. Frankland has been lecturing on artificial illumination. During the last ten years there had not been any important improvements in the manufacture of coal gas, though several new means of obtaining light for illumination had become known, the most interesting of which was the electric light. After explaining the various forms of the electric light, including the magneto-electric at the South Foreland, the lecturer turned to gas light, and explained, and illustrated by experiment, the Rev. Mr. Bowditch's plan for purifying gas from the obnoxious and pertinacious sulphide of carbon by heated hydrate of lime. Paraffine and petroleum were then noticed, and the value of these substances was compared with that of spermaceti, gas, and other illuminating agents. Assuming that the light of 20 spermaceti candles, burning for 10 hours, cost 6*s.* 8*d.*, the cost of wax to produce the same amount of light would be 7*s.* 6*d.*; of tallow, 2*s.* 6*d.*; of sperm oil, 1*s.* 3*d.*; of paraffine, 7*d.*; of common coal gas, 4*d.*; and of cannel gas, 3*d.* Dr. Frankland exhibited a reading lamp, so contrived that by an external glass the air descends in contact with the heated chimney before it reaches the flame, and by this simple means the light is increased 30 per cent. The lecturer concluded by alluding to thermo-electricity as a power that might possibly become valuable for illumination.

TENDERS.

For works at 15, Clement's-lane, City (exclusive of fittings). Mr. William Roe, architect:—

John Clemence	£1,590 0 0
Hill, Keddell, & Robinson	1,522 0 0
Marsland & Son	1,490 0 0
Bowley, Bros.	1,350 0 0

For 462 feet of iron railing, with dwarf wall and iron curb, Orphan Working School, Haverstock-hill. Mr. James Harrison, architect

Ennor	£396 0 0
Perry & Judson	370 0 0
Coleman	349 0 0
Thurlow	338 10 0

For alterations, Ockendon House, Lower-road, Islington. Mr. James Harrison, architect:—

Gatsby	£459 0 0
Ennor	388 10 0
Johnson & Cooper	379 0 0
Wheen	307 0 0

For rebuilding Llanychilwydog Church, Pembrokeshire. Mr. Withers, architect:—

Davies	£530 0 0
Thomas	470 0 0

For building new parsonage-house, Lyss, Hampshire. Mr. Withers, architect. Quantities supplied by Mr. Poland:—

Bond	£1,874 0 0
Simms	1,849 0 0
Tracey & Co.	1,806 0 0
Moon & Son	1,792 12 11
Elliott	1,763 0 0
Ellis	1,757 0 0
James & Ashton	1,725 0 0
Pitcher	1,617 3 7
Lewis	1,599 0 0
Rogers & Booth	1,535 17 0
Barnes	1,505 0 0
Sharpington & Cole	1,475 0 0

For new parsonage-house at Turnditch, Derbyshire. Messrs. Giles & Brookhouse, architects, Derby:—

Woolley	£1,287 0 0
Lilley	1,209 0 0
Oldershaw	1,205 0 0
Hall	1,180 0 0
Cash	1,165 0 0
Sheppard	1,141 0 0
Dusantoy	1,141 0 0
Gadsby	1,141 0 0
Thompson	1,124 0 0
Thompson & Fryer	1,100 0 0
Robinson	1,100 0 0

ROYAL CALEDONIAN ASYLUM.—The Directors of the Royal Caledonian Asylum, desiring to reduce the Institution debt, first to £5000, and ultimately to EXTINGUISH it, have resolved to BUILD, in the ground attached, consisting of wards for forty more female pupils, in the Caledonian road, near the new Cattle Market, Holloway. Apply to J. C. DANIEL, the Secretary, at the Asylum.
Royal Caledonian Asylum, Holloway, N. Feb. 11, 1863.

THE NEW STUDIO EASEL.
Very simple and Efficacious
WINSOR & NEWTON, Manufacturers,
38, Rathbone place, London.

VENTILATION—PURE AIR.

for the admission of Pure Air

THROUGH THE EXTERNAL WALL

With single pulley, from 6s. each; with leading pulley, from 6s. 6d.
These Ventilators are arranged to admit a large or small quantity of air may be admitted, or to exclude it entirely, without the slightest draught or beating of the casements, as they are placed in the external wall, four inches from the casements, and are covered by a perforated plate, and thus a constant supply of fresh air is obtained free from dust and rain.—HAYWARD BROTHERS, Sole Manufacturers, 187 and 189 (late 217 and 219), Upper street, Borough, London; and of all respectable Ironmongers, Builders, &c.

THE INNS of COURT HOTEL COMPANY, LIMITED.

The Directors having now completed their preliminary arrangements, and the Company being duly registered, are prepared to receive and execute orders forthwith, both for the machines (under royalty), bricks, tiles, and drain-pipes.
The Directors very confidently invite application for the remaining shares. A considerable number are already subscribed for, and an allotment will be shortly made.
The Directors reserve to themselves the right to limit the first issue of shares.
With machines made under this patent, bricks can be produced superior to hand made, at one half the present prices.
The said machines may be seen at work on application. Samples of bricks, tiles, and drain-pipes, can also be seen at the Company's Offices, where forms of application for shares and further information may be had.
J. J. S. HUGHES, Secretary.
India Buildings, Cross street, Manchester.

THE BUILDING MATERIAL IMPROVEMENT COMPANY (Limited).

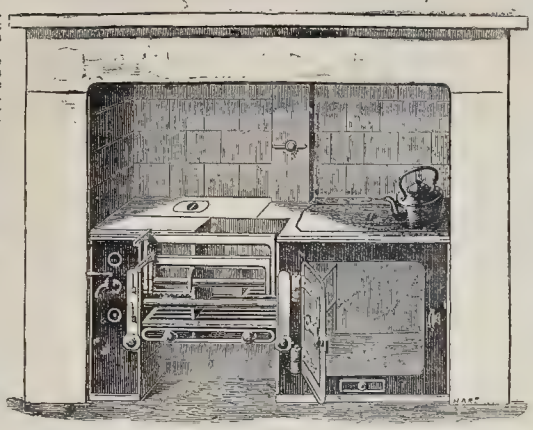
OFFICES.—9, PALL MALL EAST, S.W.



This Company is established in order to secure to the Building public inventions of practical utility and economy, and to provide the capital necessary for the purchase and development of such one as are proved to be valuable.
The disadvantages of the present method of applying plaster to the walls part to us, and consequent on buildings, have caused serious to architects, builders, and the owners of houses property. The public generally now feels the greater convenience which arises during alterations and repairs, from avoiding the dirt, dump, and delays attendant on the present plastering process. The Company, therefore, propose to commence its operations by the manufacture, on an extensive scale, of a substitute for lath and plaster, consisting of slates, for walls, ceilings, partitions, &c. called Imlock's "Patent Dry Lamins," and the Directors have secured an patent for its manufacture. When it is considered the number of square yards of brick work contained in the walls, partitions, ceilings, and the roofs of churches and chapels constantly requiring to be treated in this manner, there can be no doubt as to the demand, and that a large profit will accrue to the proprietors.
The fact that the Laminæ has been used in many brick works for nearly two years and that there are orders now in hand for considerably more than the quantity that can be executed, affords satisfactory proof of the estimation in which the Laminæ is held by the profession. Some of the Directors, who have used the material found the same beneficial to its numerous advantages; such facts, it is considered, are the best guarantee to the Company that a speedy return may be confidently promised to the shareholders.
The estimated profit to the Members of the Company, after deducting all the expenditure, is 50 per cent. on the capital, which it is proposed to the first instance to call up.
The leading advantages offered by Imlock's Patent Laminæ may be summed up thus:—
The saving of time and labour
Houses at once habitable, the Laminæ being put up dry.
The cracks found in ordinary plastering are avoided.
It is lighter and stronger than lath and plaster, and is not liable to fall, as under the old system.
The said roof completes the work, so that ceilings or partitions may be completed in one day, and rooms entirely finished, painted, and papered in two or three days.
The saving of 2d. per yard, or nearly 20 per cent. on the ordinary method of plastering.
The material being light and strong, can be advantageously supplied to any part of the country.
It is dangerous to damp and non-combustible.
It is fixed in one operation, with the greatest ease, to the joists and quarterings of new work, or to old ceilings or partitions, in repairs or alterations.
It is clear that in future investments the Company will stand in the advantageous position of having an efficient staff of officers ready to test any patent that may be laid before the Directors, without incurring any incidental expenses until it particularly struck them, that when they should have proved the worth of any such future invention, they will be enabled to light the expenses of management on the Laminæ account.
Prospectuses and further particulars may be obtained of the Secretary, at the Offices of the Company, 9, Pall Mall East, London, S.W.

MONEY on FREEHOLD and LEASEHOLD PROPERTY, by the MUTUAL LOAN FUND ASSOCIATION
Incorporated by Act of Parliament, 1850), 14, RUSSELL STREET, Covent Garden, W.C. Advances from £50 to £5,000, upon Freehold and Leasehold Property for any term up to ten years. Mortgages redeemed, and the advance can be repaid by easy instalments. Parties entitled to terminable leases can purchase the houses they occupy, and the repayment of the advance taken as rent. Greater advantages are offered to borrowers than in building societies, there being no shares to subscribe for, or compulsory withdrawals, and no deduction from the loan. No preliminary fees. Prospectus and forms of proposal sent on receipt of a directed stamped envelope.
EDWARD HARPER, Secretary.

HAY'S PATENT WATERPROOF GLUE and INDIA RUBBER VARNISH.—To ARCHITECTS, BUILDERS, Joiners, Cabinet-makers, &c. &c.—The WATER-PROOF GLUE is a special anti-damp, and is suitable for contractors, joiners, coffin makers, &c. &c. The varnish for damp walls, previous to papering, coating for verandahs, &c. &c. Copy of a letter from Messrs. Rogers & Booth, contractors, Gosport:—
"We have repeatedly used your Waterproof Glue as a preventive against damp, and have found it most valuable in preparing walls to receive paper. In one instance, where the walls were thoroughly saturated with moisture from an earth filled against the outside, we used your glue most liberally, and prepared the surface, within a few hours of its being applied, with complete success. We have also used your preparation for coating a large number of cast-iron pipes, at the Gosport Barracks, for the Royal Navy War Department."
To be had from all Ironmongers, Oil and Colourmen, &c.
Manufactory, Chandos street, Portsmouth. Mr. GEORGE WEEKS, Manager. GEORGE & C. W. BRIDEN'S Old General Agents, 12, London-street, London, E.C. where specimens of its application can be seen.

VENETIAN BLINDS shall have LEWTAS'S NEW PATENT ACTION which ENTIRELY SUPERSEDES the HOOKS and annoyance of winding the cords (can be easily fixed to old blinds). Price, 2 cord actions 2s.; 3 cord do. 3s. A liberal commission to the trade. To be had of—LEWTAS PARKS, Ironmonger and Sole Agent, 140, Fleet street, London.

CUNDY'S PATENT ECONOMIC, BRICK-OVEN, DOUBLE FALL, DOWN-BAR KITCHEN RANGE.

This drawing represents a Range 4 feet long, 2 feet 4 inches high, and 17 in. deep.

The Hob over the top of the Oven forms a HOT PLATE; the fire passes under it and all round the oven, thereby heating it thoroughly and equally all over.

The sliding Hob, which is fastened to the Winding Cheek, also forms a Hot Plate.

The Oven and Hob can be kept sufficiently hot for the purpose of baking and boiling, with the fire only six inches long.

This Range can be fitted up as a close Kitchener, with Two Ovens, Hot Closets, &c. if required.

This Range, also Cundy's Multum in Parvo Poor Man's Kitchener, also Cundy's Patent ORIGINAL FIRE-BRICK Warm Air Ventilating Stove, suitable for CHURCHES, HALLS, SCHOOLS, and STAIRCASES,

Can be seen in action every day from Nine till Seven, at the Show Rooms of the MANUFACTURER,

WILLIAM ADDIS,

6, 7, and 15, LEICESTER STREET, LEICESTER SQUARE,

WHOLESALE AND RETAIL IRONMONGER, AND STOVE GRATE MANUFACTURER,

Where Mr. CUNDY can be gratuitously consulted relative to the Cure of Smoky Chimneys.

A PROSPECTUS AND REFERENCES WILL BE FORWARDED ON APPLICATION BY LETTER.

FOUCARD, BROTHERS,
Late P. FOUCARD,
STONE MERCHANTS and QUARRYMEN.
Cargoes shipped to order from Caen to any port. Contracts taken for any quantities.
Office—10, Three Crown square, Southwark

LITTLE CASTERTON FREESTONE.
Apply for prices, &c. to
OCTAVIUS N. SIMPSON, STAMFORD;
and see Specimens at the Office of
Messrs PINDER SIMPSON & SONS, 24 Saint Paul's Churchyard, London, and at the Museum of Practical Geology, Jermyn-street, S.W.
This stone (which is a perfect oolite), is raised in blocks of any portable size, and is about four feet thick in the bed. It will stand ANY WEATHER, is much used for water works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is brought at a cheaper rate than any stone in the kingdom.

TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION.
MAGNUS'S ENAMELLED SLATE obtained the Medal of the Society of Arts, the Prize Medal at the Great Exhibition, 1851, Two First-class Medals at the Paris Exhibition, and Two Prize Medals at the International Exhibition of 1862.
Trashy imitations of this beautiful material are being palmed upon the public. Architects are therefore requested to see that the name of "MAGNUS" is upon each article.
Chimney pieces, Billiard Slabs, Table-tops, Baths, Wall-linings &c. A New Illustrated Catalogue of which can be had at the Pimlico Slate Works, 39 and 40, Upper Belgrave-place, Pimlico, S.W.

SLATES.—MESSRS. JONES & CO. have a STOCK of SLATES of different sorts from the best quarries in Wales; also Slate and Cisterns, delivered at any station in quantities of not less than five tons.—Price forwarded and estimates given on application. - Address,
No. 1, BOLD TERRACE, CHESTER.

F. RANSOME'S
NEW PATENT CONCRETE STONE,
Made without burning.
For which the Commissioners of the Exhibition of 1862 HAVE AWARDED THE PRIZE MEDAL, and which for SHARPNESS OF OUTLINE, BEAUTY OF APPEARANCE, DURABILITY, AND CHEAPNESS, stands unrivalled. Manufactured in BLOCKS of any dimensions, suitable for the construction of SEA WALLS, DOCKS, &c. as well as BUILDINGS generally. It surpasses every other material in its applicability to every description of ARCHITECTURAL EMBELLISHMENTS, CAPITALS FOR COLUMNS AND PILASTERS, CHIMNEY PIECES, TRUSSES, BALUSTRADES FOR TERRACES, GATE PIERS, CAPS, AND TERMINALS, Monuments, Tombs, and all kinds of Cemetery Requisites, &c. &c.
For prices, specimens, illustrations, and further apply to Mr. FREDK. RANSOME, 36, Parliament-street, Westminster, or Patent Stone Works, Ipswich.

W. & J. FREEMAN, Merchants in the various descriptions of STONE, GRANITE, and SLATE, for Engineering and Building Purposes. Supplies direct from the Quarries, by vessel or railway. Direct communication with the principal ports for EXPORTATION. Wharf premises and estimates for special contracts, including quarry work or other labour, forwarded on application.—Office, 27, Millbank-street, London, S.W.

O. M'CARTHY, CARMAN, and SAND and CEMENT MERCHANT, Whitefriars Wharf, Whitefriars, Fleet-street, City. Sand from above or below Bridge, delivered by the yard or per barge. Ballast, screened or unscreened, by the yard or per barge. Stocks Lime, and Old Bricks. Dry rubbish delivered, per barge, in any quantity alongside the Thames.

Clocks and Bronzes manufactured from High Art Designs by English, French, and Italian Artists of great celebrity.

ESTIMATES GIVEN FOR CHURCH AND TURRET CLOCKS.

OPINIONS OF THE LONDON PRESS UPON BENSON'S GREAT CLOCK AND WATCHES.

"As a sample of English clockwork on a large scale, the works of this are probably the finest finished that have ever been seen in this country. No chronometer could be fitted with more perfect or carefully-constructed mechanism."—*Times*, June 11, 1862.
"A triumph of genius."—*Telegraph*, March 31.
"The entire finish of the mechanism."—*Morning News*, May 20.
"A more splendid and exquisitely-finished piece of mechanism we have never seen."—*Standard.*
"The largest, and unmistakably the best finished clock in the Exhibition."—*Engineer*, Aug. 15, 1862.
"Some of them are of great beauty; and if the English watch-trade can follow up with the same spirit and success this first attempt to compete with foreigners in decorative watches there seems to be no reason why we should not get the trade entirely into our own hands."—*Times*, June 23.

33 & 34, Ludgate-hill, London.—Established 1749.

HUBBUCK'S PATENT WHITE ZINC PAINT.
By their process, which is patented, Pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.
ADULTERATIONS.—Some Paint Grinders have recently put Zinc Paint manufactured with Sulphate of Baryte from ten to thirty per cent. below the value of "Hubbuck's Patent." As the public are not aware of these practices, the workmen can readily good work with All the Advantages Workmen have towards the Patent Zinc Paint will never willingly use any other Paint for their best work
CHEAPNESS. As only half a pound weight of Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.
EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

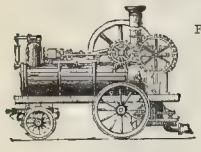
GEORGE JACKSON AND SONS

(Established in 1760)

Beg the attention of Architects, Builders, Decorators, and the trade in general, to their large assortment of Enrichments for Ceilings and Cornices, in the Gothic, Elizabethan, Italian, Renaissance, Louis XIV. XV. XVI. and many other styles; also rich or simple Panel Decorations, Elizabethan and Gothic Dados, Door Caps, Mouldings of all sizes, and to their varied selection of Centre Flowers for Ceilings, Gothic Bosses, Trusses, Column and Pilaster Caps, all executed in the highest style of art.

The large and lengthened experience of GEORGE JACKSON and SONS in decorations of Drawing and Dining Rooms, Libraries, &c. for private houses, or public buildings, many of which they have had the honour of executing under Architects of the highest eminence, enables them with confidence to direct notice to that branch of their business.



Upholsterers are invited to inspect the large variety of Glass Frames, Tables, Cornices, Screens, Candelabra, &c. The large extent of their works, and the recent adaptation of steam power and machinery, enable them to offer very superior advantages in materials and speed; while for design, purity, relief, and finish, they flatter themselves they stand unrivalled.

DURABILITY of GUTTA PERCHA TUBING.—Many inquiries having been made as to the Durability of Gutta Percha Tubing, the Gutta Percha Company have pleasure in giving publicity to the following letter from SIR RAYMOND JARVIS, Bart. VENTNOR, ISLE of WIGHT. Second Testimonial:—"March 10th, 1852.—In reply to your letter received this morning, respecting the Gutta Percha Tubing for Pump Service, I can state with much satisfaction, it answers perfectly. Many builders and other persons have lately examined it, and there is not the least apparent difference since the first laying down. How several years, and I am informed that it is to be adopted generally in the houses that are being erected here."

N.B. From this testimonial it will be seen that the CORROSIVE WATER of the ISLE of WIGHT has no effect on Gutta Percha Tubing.

References to persons using it. One trial will prove.—W. HOBMAN, Ewell, Surrey.

PLASTER of PARIS.—The only London maker, the best and the oldest established (1820), is ROBESON, Mount Pleasant, Gray's Inn-road. The cheap country-made article is bought and sold by nearly all the dealers, agents, and pretending manufacturers, careless as to quality. Superfine and fine Plaster unequalled.

BURHAM BRICK, LIME, and CEMENT COMPANY, BURHAM WHARF, BELVIDERE-ROAD, LAMBETH.—The public are informed that the Company have taken the above Premises, and have ON SALE, GAULT BRICKS, TILES, POTTERY, DRAIN-PIPES, GREY STONE LIME, PORTLAND and other CEMENTS, and BUILDING MATERIALS of all descriptions. Architects and Builders are respectfully informed that goods of any pattern or design can be manufactured at the Company's Works, erected on the banks of the Medway by the late Thomas Cubitt. They would also call the attention of the public to the very superior quality of their Portland Cement.

SALES BY AUCTION.

INTERNATIONAL EXHIBITION, 1862.—The Materials of the Annexe, the Shafting, Rizers, Columns, and Steam-pipes used for showing the Machinery in motion, and supply of the

MESSRS. FULLER & HOSKEY are instructed by Messrs. Kelk & Lucas to SELL by AUCTION, on TUESDAY, FEBRUARY 24th, 1863, and following days, at ELEVEN each day, at the Building, in lots, the capital, sound MATERIALS of the ANNEXES, the shafting, columns, steam boiler, and steam-pipes used for showing the machinery in the Western Annex of the International Exhibition Building, and the surplus plant: 60 tons wrought-iron roofing principals, each 70 ft. span, 35 ft. high; 1,500 superficial yards corrugated-iron roofing boards, 1,500 superficial yards glazed skylights (16 oz. glass), 3,500 superficial yards flooring boards, 2,000 ft. run joists, 8 in. by 2 in.; 25,000 ft. run planks, 9 in. by 3 in.; 100,000 ft. run quartering, 6 in. by 2 in. and 4 in. by 3 in.; 2,000 superficial yards 1-in. dressed match boarding, 400 squares rough ditto, 1,000 ft. glazed sashes, 2,000 ft. Dantzic timber upwards, 1,000 ft. run, in lengths with turned heads complete, bevel, and base plates, with bolts and nuts complete, 2,000 feet length of turned wrought iron shafting, 2½ to 3¾ in. with couplings and self-lubricating pedestals; 20 turned risers, 2 ft. 6 in. diameter, 9 pair mortise and mitre-wheels (20 tons weight and flanged cast-iron steam piping, from 2 in. to 18 in. diameter, with expansion joints, valves, &c.; 30 pairs wrought-iron blocks, 1 Hoyt's (or similar) boiler, 3 tons rope falls, 100 dozen scaffold-cords, scaffold boards and planks, 13 derrick cranes, from 1 ton to 6 tons, by Bowser, Cameron, & Co.; erection of steam boiler-house, with corrugated-iron roof and circular chimney-shaft; 100 rods new brickwork; erection of gantry, 65 ft. long, with two travellers, 3 tons and 1 ton, 25 ft. rise; erection of watercloset seats and urinals; 80 double and single seats with iron standards; and numerous other effects. — To be viewed on Saturday and Monday previous to the sale, from NINE to FOUR o'clock when catalogues can be had; and but which no person will be admitted), may be had at the building, or previously of Messrs. FULLER & HOSKEY, 13, Billiter-street, London, E.C.

N.B. Approved bills at three months' date will be taken from purchasers to the extent of 50*l.* and upwards.

CITY OF LONDON.—Freehold Building Site, comprising the large Area of a Quarter of an Acre.

MESSRS. WILSON & SCOBLE will SELL by AUCTION (by direction of the Executors of the late Robert Stephenson, esq., D.C.L.) at GARRAWAY'S on THURSDAY, MARCH 5, at ONE o'clock precisely, a highly valuable and important FREEHOLD PROPERTY, comprising the extensive premises upon which the works of Messrs Swinburne, Blake-glass Manufacturers, have been carried on for the last half century; known as "Red Bull Wharf," No. 89, Upper Thames-street, in the best position between Southwark and London Bridges, and opposite the range of warehouses of Messrs. Humphery on the Surrey side; having by a recent grant of the Thames Conservancy a fair frontage to the river of 161 feet by a great depth of about 150 feet. The property is bounded on the west by the premises of the City of London Brewery Company, and on the east by a wide paved passage and the open river Wharf of Messrs Turney-croft, and has an excellent carriage-way to Upper Thames street. The site is in every way most eligible for the erection of very light first-class bonded warehouses, with extensive wharfage so much in demand in the neighbourhood, from the demolition of the very many wharfs or properties taken for railway requirements. The buildings at present comprise a four-tier wide-roofed warehouse, brick and timber, and an dwelling house of modern construction, the whole of good, sound materials. The present tenants are under notice to quit, and therefore possession can be given at Midsummer next. May be viewed, and particulars, with plans, had of J. H. STANTON, Esq. Solicitor, Newcastle-upon-Tyne; of Messrs HAYES, TWISDEN, PARKER, & CO. Solicitors, 60, Russell-square; at Garraway's; and of Messrs WILSON & SCOBLE, Auctioneers and Estate Agents, 114, Leadenhall-street, E.C.

NORTH LONDON RAILWAY.—City Extension.—First Clearance Sale.

MESSRS. KENNEDY & BONNY will SELL by AUCTION, on the PREMISES, on TUESDAY and WEDNESDAY, MARCH 24th and 25th, 1863, at TWO o'clock, by order of the Directors of the North London Railway Company, the BUILDING MATERIALS, FIXTURES, and FITTINGS of about 300 HOUSES, situate in the parishes of Shoreditch, Hackney, and locality of Union-street, Union-crescent, and Kingsland-road, comprising bricks, slates, tiles, joists, girders, rafters and other timber, doors, sashes, doors frames, sheets, lead and zinc pipes, gutters, &c. marble and other chimney-pieces, stoves, ranges, bells, &c. slop-stools and fittings. NOTICE TO ARCHITECTS.—The Proprietors of the late Mr. Billing's Patents have secured the services of Mr. E. H. COLLINS, M.I.B.A. of No. 10, Poultry, E.C. as the Consulting Architect, from whom full particulars and the reduced prices may be obtained; or from the Manager, Mr. TYLER, 19, Abingdon-street, Westminster, S.W.

COMPETITIONS.

NOTICE to ENGINEERS, CONTRACTORS, and OTHERS.—The Town Council of Kingston-upon-Hull offer PREMIUMS of 50*l.* for the Best, and 25*l.* for the Second Best, approved Plan, specification, and Estimate for a New Bridge crossing the River Hull, in the place of the present old North-bridge. The Plans, &c. to be sent in to the Town-clerk's office, on or before the 4th APRIL, 1863.—Further information may be obtained on application to Mr. THORP, Corporation Surveyor, Hull.

By order,
ROBERT WELLS, Town Clerk.
Hull, February, 1863.

TO ARCHITECTS.—The Town Council of Gateshead invite DESIGNS for the PROPOSED NEW TOWN HALL and CORPORATE BUILDINGS. A premium of 100*l.* will be paid to the author of the designs to which the Town Council shall award the first place, and a premium of 50*l.* to the author of the designs to which they shall award the second place. The designs are to be delivered, free of cost, at the Office of the Town Clerk, on or before the 1st of MAY next; and the two designs to which premiums shall be awarded will become the absolute property of the Town Council, without any condition whatever. A copy of the conditions to be observed by architects in drawing in designs, and a lithographic copy of the plans and sections of the ground will be supplied to competitors on application to the undersigned, and on payment of a charge of 5*s.*—By order,
J. W. SWINBURNE, Town Clerk.
Town Hall, February 13, 1863.

TO ARCHITECTS.—FREEMASONS' HALL, LONDON.—The Committee entrusted by the Grand Lodge with this subject invite PLANS and DESIGNS for the NEW BUILDINGS, and hereby offer the following premiums, viz: 150*l.* for the best, 100*l.* for the second, and 50*l.* for the third best design. Designs must be sent in on or before the 1st day of MAY next.—Printed instructions, together with the plans of the site, and of the present buildings, may be obtained (price 10*s.* 6*d.* which will be returned to those who forward designs) at the Office of the Grand Secretary, Freemasons' Hall, London, W.C.

TO ARCHITECTS.—BICENTENARY MEMORIAL SCHOOLS.—The Union Chapel Building Committee invite Architects to submit DESIGNS, with details, specifications, and estimates, for the ERECTION of the above SCHOOLS; the design to harmonize with the chapel to which it is to be annexed. The cost of the building, including all extras, not to exceed £*nl*. A premium of 10*l.* will be paid for the design, plans, &c selected by the Committee (and which can be carried out for the sum named). On payment of the premium, the Committee will be entitled to the design, plans, and specifications selected, but are not to be considered as bound to employ the parties furnishing them; but in the event of a successful competitor being employed, the premium will merge in his commission.—For further particulars, together with a view of the site, application must be made to Mr GEO. HART, Park square, Luton. The designs, plans, &c. to be forwarded, under a motto, with a sealed letter to correspond, on or before SATURDAY, the 21st of MARCH next, to Mr G STRANGE, Superintendent of the Union Chapel Sunday Schools, Wellington-street, Luton.
Luton, February 18, 1863.

CONTRACTS.

ARMY CONTRACTS.—TENDERS will be received at this Office until Noon on the 7th of MARCH next, from parties who may be willing to enter into CONTRACT for the SUPPLY of HOUSE COALS (Wall's-end) in such quantities as may be required, for one year, from the 1st APRIL, 1863, for the use of the Royal Military College, Sandhurst.
Forms of Tender and conditions of contract may be obtained on application at this Office; and no Tender will be noticed unless made on such prescribed form, and delivered at this Office by the hour appointed.
HENRY B. MORSE, Deputy-Commissary-General.
Commissariat Office, Aldershott, February 19, 1863.

ARMY CONTRACTS.—TENDERS will be received at this Office until NOON on the 7th MARCH next, from parties who may be willing to enter into CONTRACTS for the SUPPLY of HOUSE COALS (such as that known as Newport Small's), in such quantities as may be required, for the year, from the 1st APRIL, 1863, for the use of the Waterworks at Bentley, near Aldershott. Forms of Tender and conditions of contract may be obtained on application at this Office; and no Tender will be noticed unless made on such prescribed form, and delivered at this Office by the hour appointed.
HENRY B. MORSE, Deputy-Commissary-General.
Commissariat Office, Aldershott, February 19, 1863.

ARMY CONTRACTS.—TENDERS will be received at this Office until NOON on the 7th of MARCH next, from parties who may be willing to enter into CONTRACTS for the SUPPLY of FUEL and LIGHT, consisting of coals, coke, wood, composite and dip candles, in such quantities as may be required for the use of Her Majesty's Forces and Military Departments at Aldershott Camp, for one year, from the 1st of APRIL, 1863.
Forms of Tender and conditions of contract may be obtained on application at this Office, and no Tender will be noticed unless made on such prescribed form, and delivered at this Office by the hour appointed.
HENRY B MORSE, Deputy Commissary-General.
Commissariat Office, Aldershott, February 19th, 1863.

COAST GUARD CONTRACT.—NOTICE to BUILDERS and CONTRACTORS.
Persons desirous of TENDERING for the ERECTION of a COAST GUARD STATION at Shingle End, near Sandwich, in the County of Kent, may inspect the Drawings and Specifications at the Custom House, Ramsgate, or at this Office, between the hours of TEN and FOUR, from MONDAY, the 2nd, to SATURDAY, the 14th day of MARCH now next ensuing, and both inclusive (Sunday excepted).
Tenders to be sent to this Office not later than TWELVE o'clock at NOON on MONDAY, the 16th MARCH, under seal, and directed to the Commodore Controller General of Coast Guard, and endorsed "Tender for Shingle End."
The Lords Commissioners of the Admiralty do not pledge themselves to accept the lowest or either of the Tenders.
Dated the 20th day of February, 1863, at the Admiralty
Coast Guard Office, 12, Spring Gardens, London, S.W.

TO BUILDERS.—The Stockton and Darlington Railway Company are prepared to receive TENDERS for certain ALTERATIONS and ADDITIONS to the PASSENGER STATION at BARNARD CASTLE. Plans and Specifications may be seen upon application to the Architect, at the Railway Office, Darlington, from WEDNESDAY, the 25th day of FEBRUARY, to WEDNESDAY, the 11th day of MARCH, inclusive. Tenders to be delivered on or before the last named date, addressed to the Secretary, and endorsed "Tender for Barnardcastle Station." No pledge is given that the lowest or any Tender will be accepted.
THOS. MACNAY, Secretary.
Railway Office, Feb. 20, 1863.

CONTRACTS.

EXTENSION of TIME for receiving TENDERS.—CITY of LONDON, BARBERS' HALL.—Important SITE for WAREHOUSES or MANUFACTURING PREMISES in the immediate vicinity of Wood street, Cheapside.—The Committee of the Worshipful Company of Barbers will meet at their Hall on THURSDAY, the 26th day of MARCH, 1863, to receive TENDERS for LETTING, on a Building Lease for 99 years, the Extensive PREMISES known as Barbers' Hall, situate in Monkwell street, Woodstreet, comprising three houses fronting Monkwell street, Nos 33, 34, and 35; part of the courtyard in the rear thereof, the passage leading thereto, and the greater portion of the Company's Hall, together with the kitchen, scullery, and outbuildings, having a frontage towards Monkwell-street of about 33 feet, by an average depth of about 116 feet, and an extreme depth of about 134 feet.—Full particulars, with a plan of the property, elevation and section of street-front, also conditions of letting, may be obtained on application to the Clerk of the Company; to Mr. CHARLES JOHN SHOPPEE, the Company's Surveyor, No. 61, Doughty-street, W.C.; or to the Beadle at the Hall.—By order,
HENLEY GROSE SMITH, Clerk.
4, Warnford-court, Throgmorton-street, E.C.

TO IRONFOUNDERS and CONTRACTORS.—SHARD BRIDGE, in the County of Lancaster.—The Directors of the Shard Bridge Company (Incorporated by Act of Parliament) are prepared to receive PLANS, SPECIFICATIONS, and TENDERS for the ERECTION of an IRON GIRDER BRIDGE, upon screw piles, across the tidal river Wyre, at the Shard, near Poulton-le-Fylde, in the county of Lancaster. The space for waterway, the level of the bridge, the width of roadway required, with sections of the borings, and all other necessary particulars, may be obtained on application to Messrs. MYRES & VERVERS, Civil Engineers, Preston, to whom plans, specifications, and Tenders must be sent, on or before MONDAY, the 9th day of MARCH next. The directors will not bind themselves to pay for plans or drawings of the bridge which are not adopted.—By order,
RICHARD MOORE, Solicitor to the Company.
Kirkham, Lancashire, February 10th, 1863

TO BUILDERS.—Persons desirous to TENDER for the ERECTION of new Presbyterian CHURCH and SCHOOLS at Aldershott, can see the plans, &c. at Mr TILBURY'S Royal Hotel, Aldershott, on and after MARCH 20th, 1863. Copies of quantities will be supplied on application at the above Hotel, for the sum of 5*s.* per copy. Tenders to be sent to me on or before the 31st day of MARCH next. Neither the lowest nor any Tender will necessarily be accepted.
G. B. MUSSELLWHITE, Architect,
Basingstoke.

TO CAPITALISTS, BUILDERS, and OTHERS.—Persons willing to ERECT two small detached VILLAS on the Nanhoran Hill, adjoining the Nantipond, may obtain Plots of Land for that purpose, in the best part of this picturesque locality, commanding extensive views of the Vale of Gloucester and surrounding country, on Building Leases at a very low ground rent, with power to purchase the freehold. A lease for Ten years, to pay 7*l.* per cent. per annum, will be granted for one house.—Full particulars and every information will be given on application to Mr. GEO. W. SADLER, Architect and Surveyor, 407, High-street, Cheltenham.

SAINT PANCRAS, MIDDLESEX.—To MASONS, PAVIORS, and OTHERS.—Notice is hereby given, that the Highway, Sewers, and Public Works Committee of the Vestry of the Parish of St. Pancras will meet at the Office of the Department of Works, on MONDAY, the 9th MARCH, 1863, at SIX o'clock p.m. to receive and consider TENDERS from persons willing to CONTRACT, until Lady-day, 1864, for the EXECUTION of MASONS' and PAVIORS' WORKS to the Footways and Roadways within the said Parish, pursuant to the terms of specification, to be seen daily at the Office of the Department of Works. Good security will be required for the performance of the Contract.—Further particulars, with the Form of Tender, may be obtained, on the deposit of 1*l.* at the Office of Mr. WILLIAM BOOTH SCOTT, C.E. Chief Surveyor, as under. The Vestry do not pledge themselves to accept the lowest or any Tender. No Tender will be received unless made out on one of the printed forms. Tenders must be delivered by SIX o'clock p.m. on the said MONDAY, the 9th MARCH.
CHARLES WORRELL, Chief Clerk of the Department of Works.
13, Edward street, Hampstead road, February, 1863.

CALNE RAILWAY COMPANY.—The Directors are prepared to receive TENDERS for the ERECTION of STATION BUILDINGS at Calne. Plans and specifications can be seen at the Office of the Engineer, JAMES B. BURKE, Esq., 4, Queen's-square, Westminster, and at the Office of the Secretary at Calne. Tenders, addressed to the Directors, to be delivered at the Secretary's Office, on or before the 6th day of MARCH next. The Directors do not bind themselves to accept the lowest or any Tender.
Calne, Feb 19, 1863.
W. M. VIZARD, Secretary.

TO BUILDERS.—TENDERS are required for the ERECTION of the proposed CHURCH of the HOLY TRINITY, Shrub Hill. Plans and specifications may be seen, and further particulars obtained, upon application at the Office of WILLIAM JEFFREY HOPKINS, Architect, Sansome Lodge, Worcester. Tenders to be delivered before the 10th day of MARCH next. The lowest Tender will not necessarily be accepted

THE OTTOMAN GAS COMPANY (Limited).—The Directors of this Company are prepared to receive TENDERS for the CONSTRUCTION of GAS WORKS at SMYRNA. The drawings and specifications may be seen, and bills of quantities and forms of Tender may be obtained, on application to Mr BAYLISS, C.E. 2, Parliament street, Westminster, S.W. on and after WEDNESDAY, the 4th day of MARCH.—Tenders must be sealed and endorsed "Tender for Smyrna Gas Works," and must be delivered at the Offices of the Company, 6, Copthall-court, London, E.C. on or before ELEVEN a.m. on FRIDAY, the 13th day of MARCH. The Directors do not bind themselves to accept the lowest or any Tender. By order of the Board,
February 23rd, 1863.
WALTER DAVISON, Secretary.

[For remainder of Contracts see next Page.

CONTRACTS.

TO CONTRACTORS, BUILDERS, &c.—TENDERS are invited for the ERECTION of a PIER at Porthgain Harbour, and for a WINDMILL, WORKSHOPS, and MILL DAM, on one, or the other, or both of the last-named Contracts. Specifications may be had by post on payment of five shillings for each; and plans may be seen at the Office of W. H. GOLDSMACKER, Esq., C.E., 17, Charles-street, Milford, South Wales; or at the Office of Messrs. HEWETT & GRIERSON, Portgain Slate Quarries, Trevine, Haverfordwest, to whom Tenders must be sent on or before the 1st of MARCH. The advertisers do not bind themselves to accept the lowest or any Tender.

TO BUILDERS and CONTRACTORS.—Persons desirous of TENDERING for the ERECTION of a New CHURCH at Clay-hill in Kings, near Cheltenham, may inspect the plans and specifications at the Office of the Architect, No. 26, High-street, Cheltenham, on and after MONDAY, the 16th instant. Sealed Tenders, endorsed "Tender for Church at Charlton Kings," to be sent to Mr. LOCKE, Esq., Solicitor, 3, Promenade-buildings, Cheltenham, on or before SATURDAY, the 7th MARCH. The lowest or any Tender will not necessarily be accepted.

GEORGE W. SADLER, Architect.

Cheltenham, February 10th, 1863.

TO GAS ENGINEERS, CONTRACTORS, and OTHERS.—The Directors of the Cardigan Gas and Coke Company (Limited), are prepared to receive PLANS, SPECIFICATIONS, and TENDERS for the ERECTION of the WORKS for the Manufacture of Coal Gas, and the Supply of Seventy-two Public Lights. The lowest offer will not necessarily be accepted. The plans may be had at the respective offices. For plans, &c., to be sent to the Chairman of the Board of Directors, THOMAS DAVIES, Esq., Bank House, Cardigan, on or before SATURDAY, the 21st of MARCH next.

Cardigan, 19 Feb., 1863. L. LOWTHER, Secretary.

ORPINGTON, Kent, one mile from St. Mary Cray Station.—Builders desirous of TENDERING for the ERECTION of a pair of Semi-detached VILLAS, a stable, &c., from the drawings and specification to an elevation at the Office of Mr. JACKSON, 11, Arcadia-row, Mile End New Town, E., or as will be on view till MONDAY, the 9th day of MARCH, by the Proprietor, will find it useful to accept the lowest or any Tender.—Money will be advanced as the works proceed.

LONDON and NORTH-WESTERN RAILWAY.—To CONTRACTORS.—The Directors are desirous of receiving TENDERS for the CONSTRUCTION of the RAILWAY from Alston, through Garrigill to Hilton, with Branch from Kenwards to the Duke's Dock, a thousand-yards of Coal-road and Landsale, a distance of eight miles, or thereabouts. Parties desirous of Tendering may see the drawings, and obtain a statement of the quantities, upon application to Mr. WILLIAM BAKER, Engineer, Euston Station, on TUESDAY, MARCH 3rd, between the hours of TEN and FOUR o'clock. Tenders addressed to the Secretary, at this Office, to be sent in on or before WEDNESDAY, MARCH 18th, at FOUR o'clock p.m. The Directors do not bind themselves to accept the lowest Tender. By order

Euston Station, February 23, 1863

CIRENCESTER CORN HALL.—To BUILDERS.—Persons desirous of CONTRACTING for the ERECTION of NEW PUBLIC BUILDINGS, and PRINCIPAL ENTRANCE to CORN HALL, in Dyer-street, may see the working drawings and specification at Messrs. MALLAND, MABERLY, & MEDLAND'S Offices, Gloucester, on and after 2nd MARCH.—Sealed Tenders to be addressed to Mr. R. K. HARGOOD, Hon. Secretary, Cirencester, and delivered 12th MARCH.—The lowest Tender will not necessarily be accepted.

R. K. HARGOOD, Hon. Sec.

Cirencester, February, 1863

METROPOLITAN BOARD of WORKS.—To BUILDERS, CONTRACTORS, and OTHERS.—The Metropolitan Board of Works hereby give Notice, that they will meet at the Office of the Board, Spring-gardens, S.W. on FRIDAY the 27th day of MARCH, 1863, at WELVE o'clock at noon precisely, and will then be prepared to open TENDERS from parties who may be willing to CONTRACT for the FORMATION and PAVING of an INTENDED NEW STREET, the CONSTRUCTION of an ARCHED SUBWAY, 12 feet in height, of Brick-work, 18 feet, or there-abouts, of Cellarage, 970 feet, or thereabouts of Area Wall, 1,710 feet or thereabouts of Brick sewer, at the various points in connection therewith, in the West End new approach street, known as Great Smithfield-street, and the kerb-stones in the respective lines of St. Bartholomew-close, and Charterhouse-street, in the County of Surrey. Plans, sections, and specifications, to be seen with the Board of Works, as above mentioned, and other particulars obtained, on application to Mr. J. W. BAZALGETTE, Engineer of the Board, at the Office, Spring-gardens, between the hours of NINE am and FOUR p.m. on SATURDAYS, between the hours of NINE a.m. and TWO p.m. and THURSDAY, the 26th day of MARCH, 1863. The Tenders are to be addressed to the Clerk of the Board, and delivered at the Office by FOUR o'clock on the said last-named day, and no Tender will be received after that hour. The parties Tendering must be in attendance at the Board at TWELVE o'clock on the day appointed for opening Tenders. The Board do not bind themselves to accept the lowest or any Tender, but the party whose Tender shall be accepted will be required to enter into two sufficient sureties for the due satisfactory performance of the works.

JOHN POLLARD, Clerk of the Board.

Spring-gardens, S.W. February 23rd, 1863

TO BUILDERS.—HIGHBRIDGE CHURCH SCHOOLS, Somerset.—Builders are invited to submit TENDERS for the above-named ELECTION of SCHOOL BUILDINGS at Highbridge. The plans and specifications can be seen on and after MONDAY, the 2nd MARCH, at my office, and to be returned to the Rev. H. MACAULAY, at the Parsonage. Estimates to be forwarded, by the 14th MARCH, to the Architect, Mr. NORTON, 21, Old Ecclesiast, W.

BERMONDSEY, ROTHERHITHE, and DEPTFORD ROADS.—BROKEN GUERNSEY GRANITE, and other STONE.—To Trustees of the several Roads under the Surrey Office, No. 151, Bermondsey street, Bermondsey, in the county of Surrey, on WEDNESDAY, the 25th day of MARCH, 1863, at TWELVE o'clock at noon, precisely, to receive TENDERS for the SUPPLY during one year of BLUE BROKEN GUERNSEY GRANITE CHIPPINGS of the best description, to be delivered to the satisfaction of the surveyor at the Yards, and to be delivered in quantities of 400 yards at a time, at Jamaica-road, Bermondsey-wall, at the Grand Surrey Canal, Rotherhithe; and a like quantity at Cherry Garden Wharf, Bermondsey-wall, Deptford, before the 1st day of MAY, and the 1st day of JUNE next, and one half of the remaining quantity to be delivered in like manner before the 1st day of JULY next, and the remainder in like manner before the 1st day of OCTOBER next, and the remainder in like manner, at a ledge to the same certain Yards, and by a sufficient boat-quality thereof, at the Yards of the Trustees. The Tenders to state the quantities proposed to be delivered. The Contractor will be subject to the payment of a penalty of 20l. in case of failure to deliver the above-mentioned quantities at any of the respective Yards or Landing-places.

G. H. DREW, Clerk to the Trustees.

151, Bermondsey street, S.E. 23rd Feb., 1863.

PERSONS desirous of TENDERING for the ERECTION of a DOUBLE VILLA at Darlington, may inspect the specification, plans, at the Office of THOMAS SIMPSON, Architect, Northgate, on and after WEDNESDAY, the 4th day of MARCH, 1863. WEDNESDAY, the 18th, at the Office of JOSEPH TEASE, Land Agent, Darlington, on FRIDAY, the 13th day of MARCH, and WEDNESDAY, the 1st day of APRIL, at the Private Office of Messrs. JOSEPH TEASE, Sons, and delivered at the Offices last mentioned, by NOON, on the 2nd of APRIL. The lowest or any Tender not necessarily accepted.

GENERAL ILLUMINATION.—IMPORTANT NOTICE.

J. DEFRIES & SONS

Beg to inform the Public that they have only a few of their

REGISTERED CRYSTAL DEVICES

left, for which early applications must be made as they cannot possibly make up any more for the forthcoming Illumination.

GLASS CHANDELIER MANUFACTORY, 147, HOUNDSDITCH, LONDON.

WATERING the ROADS.—The Vestry of the Parish of St. James and St. John, Clerkenwell, will meet at the Vestry Hall, 24, Upper Rosoman-street, on THURSDAY, the 5th MARCH next, at HALF-past SIX o'clock in the evening precisely, to receive TENDERS for the SUPPLY of WATER CARTS HORSES, MEN, and all other necessaries, and to do Water-work in the Streets, Roads, and Places in the Parish for a year, from the time ordered for the 1st of April, from stand-pests to be put up by the Vestry. For the purpose the Parish is divided into two districts: District No. 1 consisting of wards 1, 2, and 4; and district No. 2 consisting of wards 3 and 5; and a separate Tender must be sent in for each. Forms of Tender (which alone will be received) may be had at the Vestry Hall, between the hours of TEN and FOUR daily. All Tenders are to be sealed up, and left at the Vestry Hall by FOUR o'clock on the day of meeting, and no Tender will be received or returned to each person whose Tender is not accepted, but will be retained in the other cases until the contract and bonds are signed. The Vestry do not bind themselves to accept the lowest or any Tender

ROBERT PAGET, Vestry Clerk.

Vestry Hall, Clerkenwell, 21st February, 1863

TO SCAVENGERS and DUST CONTRACTORS.—The Vestry of the Parish of St. James and St. John, Clerkenwell, will meet on THURSDAY, the 26th of MARCH next, at the Vestry Hall, Upper Rosoman-street, at HALF-PAST SIX o'clock in the evening, to receive TENDERS for DUSTING at 1 for the HOUSES, SHOPS, and other PREMISES within the Parish. For the purpose the Parish is divided by the Vestry into the 25th MARCH next to the 25th of MARCH, 1864. For cleansing and lighting purposes, the Parish is divided into two districts—No. 1 comprising Wards 1, 2, 3; No. 2 comprising Wards 4 and 5, which districts must be tendered for separately, and one contractor will not be permitted to have both districts. The Vestry do not bind themselves to accept the lowest or any Tender. Persons tendering must be prepared to give security for the faithful performance of their contract. Sealed Tenders, endorsed, "Tender for Dusting and Removal of Ashes," and enclosing a 2s. Bank of England note as a guarantee of good faith, must be sent in by FOUR o'clock on the day of meeting. Forms of Tender and further particulars may be had at the Vestry Hall from TEN till FOUR daily.

ROBERT PAGET, Vestry Clerk.

Vestry Hall Clerkenwell, February 21, 1863

MIDLAND RAILWAY.—The Directors are prepared to receive TENDERS for the REPAIRS and MAINTENANCE of the whole of the WROUGH BRIDGES and WEIGHING MACHINES on the Midland Railway, for a term of three years from and after the 25th day of MARCH next.—The form of Contract may be seen, and further particulars obtained on application at the Engineer's Offices, Derby Station, on and after the 3rd of MARCH; and no Tender can be received after TEN a.m. on TUESDAY the 17th day of MARCH next. The Directors do not bind themselves to accept the lowest or any Tender.—By order,

G. N. BROWNE, Secretary

Derby, February 24th, 1863.

TO MASONS and PAVIORS.—The Commissioners of Sewers of the City of London will meet in the Guildhall of the said City, on THURSDAY, the 12th of MARCH next, at TWELVE o'clock precisely, to receive TENDERS for the execution of such MASON'S and PAVIOR'S WORKS as may be required by them to be done within the year ensuing, for a period of THREE YEARS, from Lady Day next, upon the terms contained in their specifications, model copies of which may be obtained at this Office on payment of 10s. each, which will be returned to such persons who shall send in a bond fide Tender. Persons Tendering are required to give the names and addresses of at least two substantial householders as Sureties, who will enter into bond with the Contractor for the due performance of the Contract. The Commissioners do not pledge themselves to accept the lowest Tender or any unless deemed to be for the public advantage. No Tender will be received after TWELVE o'clock on the day of treaty. The Party sending in proposals must attend personally, or by duly authorised agents, on the day and hour mentioned.

JOSEPH DAW, Principal Clerk.

Sewers' Office, Guildhall, 23rd February, 1863

PARISH of ST. MARY ABBOTT'S, Kensington, in the County of Middlesex.—PAVING CONTRACT.—The Works, Buildings and Sanitary Committee of the Vestry of the Parish aforesaid will meet at the Vestry Hall, Kensington Church Green, on FRIDAY, the 6th day of MARCH next, at SEVEN o'clock in the evening, to receive TENDERS and to CONTRACT for new YORKSHIRE PAVING, GRANITE KERB (CHANNELS, and DRESSED GRANITE), and other KEERING, &c.; also for Re-laying old Kerb Pavement and Channels, and re-setting Iron Rails. The form of Tender may be obtained on application at the Vestry Surveyor, Mr JAMES BROADBRIDGE, at his Office, Vestry Hall aforesaid. Tenders to be sealed and endorsed, "Tender for Masons' and Paviors' Work," and to be delivered at my Office by or before FOUR o'clock in the Afternoon of FRIDAY, the 6th proximo. No Tender will be received unless made upon one of the said printed Forms. The Vestry do not hold themselves bound to accept the lowest or any Tender. The contractor to enter into a written contract, and to pay the expense thereof.—By order,

REUBEN GREEN, Clerk of the Vestry.

Vestry Hall, Kensington, 21st February, 1863.

BUILDING MATERIALS.—TO DEALERS, &c.—TO BE SOLD by TENDER all the valuable BUILDING MATERIALS of PREMISES situate and being 68 Aldermanbury City, including good tiling, lathwork, timbers, flooring, doors, sashes, &c. Premises can be seen of the Caretaker. EACH TENDER to be in the afternoon of the day of meeting, and any Tender which is not upon the printed form prepared by the Board, and duly signed by the person or persons tendering, will be rejected. Persons signing, or their representatives, are required to attend the meeting of the Board. The Board do not bind themselves to accept the lowest or any Tender.

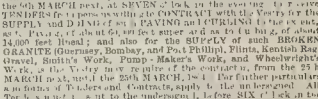
ALFRED TURNER, Clerk to the Board.

18, Great Abe street, Whitechapel, Feb. ary 25, 1863.

BOROUGH of BLACKBURN.—To SEWER and DRAIN PIPE MANUFACTURERS.—The Corporation of this Borough is prepared to receive TENDERS for the SUPPLY of SEWER and DRAIN PIPES, BENDS, JUNCTIONS, TRAPS, &c. required during the year ending December 31st, 1863. Persons desirous of tendering for the above may see the specification and conditions, and obtain all necessary information, on application to Mr. BRIERLEY, Borough Surveyor, at his Office, Town Hall, Blackburn. Sealed Tenders, indorsed "Tender for Sewer Pipes," addressed to the Town Clerk, may be sent to the Town Clerk's Office, Town Hall, Blackburn, not later than WEDNESDAY, the 11th day of MARCH next. The Town Council will not be bound to accept the lowest or any Tender.

HENRY SAWARD, Town Clerk.

Town Hall, Blackburn, February 22nd, 1863



VESTRY of ST. MARY, NEWINGTON, SURREY.—CONTRACTS for PAVING, GURRING, BROKEN GRANITE (Guernsey, Bombay, and Port Phillip), FLINTS, KENTISH RAG, GRAVEL, SMITH'S WORK, PUMP-MAKER'S WORK, and WHEELWRIGHT'S WORK.—The Paving Committee of the Vestry will meet at the Vestry Hall, on the Parish Ground, on MONDAY, the 9th MARCH next, at SEVEN o'clock in the evening, to receive TENDERS for opening Tenders and to CONTRACT with the Vestry for the SUPPLY and DELIVERY and PAVING and CURBING to the several Parts of about 60,000 feet superficial of Broken Granite (Guernsey, Bombay, and Port Phillip), Flints, Kentish Rag, Gravel, Smith's Work, Pump-Maker's Work, and Wheelwright's Work, as the Vestry may require during the currency of the Contract, from the 25th MARCH next, until the 25th MARCH, 1864. For further particulars and forms of Tenders and Contracts, apply to the undersigned. All Tenders are to be endorsed, "Tenders for Paving," before SIX o'clock in the evening, on MONDAY, the 9th MARCH next, and the several persons willing to contract, must attend the Committee, at SEVEN o'clock on the same evening.

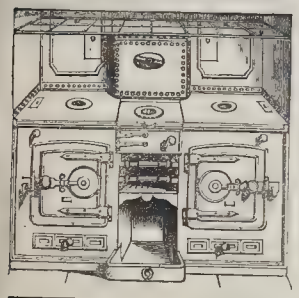
CUNDY'S MULTUM IN PARVO ECONOMIC POOR MAN'S KITCHENER.

WHEN OPEN.



These drawings represent a Stove of the following dimensions:—24 inches long, 24 inches high, and 15 inches deep, when used as an open fire-stove, and also when closed, for BAKING, BOILING, and IRONING. The oven, which is placed underneath the fire, is 18 inches long, 14 inches deep, and 11 inches high. The flue passes all round the Oven, and the Boiler will contain six gallons of water. This Stove, which is also made 30 inches long, 26 inches high, and 15 inches deep, is admirably adapted for BACK KITCHENS, as an auxiliary Cooking Stove, and for STILL-ROOMS, NURSERIES, and SMALL HOUSES, the consumption of coal being only 112 lbs. per week. This Stove, also Cundy's Patent BRICK OVEN Double Fall-down Bar KITCHEN RANGE; also Cundy's Warm-Air Ventilating Stove, suitable for CHURCHES, HALLS, STAIRCASES, and SCHOOLS, for which invention Mr. Cundy received the SOCIETY OF ARTS MEDAL, also a Medal from the Royal Commissioners of the GREAT EXHIBITION of 1851, can be seen in operation daily, at the Show-rooms of

THE MANUFACTURER,

WHEN CLOSED.

DAY and GAS-LIGHT REFLECTOR MANUFACTURER.—THOMAS FOX, 90, Hatton Garden, E.C. These Reflectors never tarnish, require no cleaning, and are the most effective and durable yet presented to the public. All kinds of Bent Glass Silvered.

N.B.—The usual discount to builders and the trade.

ST. PANCRAS IRON WORK COMPANY,

OLD SAINT PANCRAS ROAD, LONDON, N.W.

PATENT WROUGHT-IRON STABLE FITTINGS

SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—

That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick, or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, WITH RACK AND WATER-TROUGH,

The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.

These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible; advantages peculiarly their own.

THE PATENT HARNESS FITTINGS

Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.

PERIN'S PATENT BAND SAW BLADES.

S. WORSSAM & CO beg to announce that they have purchased of Mons. Perin, of Paris, the exclusive right to SELL his celebrated BAND SAW BLADES (the superiority of which is universally allowed) in the United Kingdom. S. W. & Co. have always a large assortment of these Saws at their Works, 304, KING'S-ROAD, CHELSEA, S.W. where also the Band Saw Machine exhibited by Mons Perin in the Western Annexe, International Exhibition, is now on sale.

IRON CASTINGS, WROUGHT and CAST-IRON GIRDERS FLITCHES, and TANKS. Iron Roofing, and every description of Smith and Founders' work. Estimates given.

JAMES HAYWOOD, JUN.

PHŒNIX FOUNDRY AND ENGINEERING WORKS, DERBY.

CAUTION to ARCHITECTS and BUILDERS.—In consequence of complaints arising from the substitution of INFERIOR and SPURIOUS ARTICLES instead of SMITH'S PATENT DOUBLE ACTION DOOR SPRINGS; SMITH'S PATENT WEATHER TIGHT WATER BAR; and SMITH'S PATENT WEATHER TIGHT CASEMENT FASTENING for FRENCH WINDOWS.

The above are most respectfully requested to observe that all GENUINE ARTICLES are stamped with the NAME and ADDRESS, SMITH, Patentee, 58, Princes-street, Leicester-square, London; and SUCH ONLY are WARRANTED.

LAMBERT, BROTHERS, Manufacturers of Lap welded Boiler Tubes, Locomotive and Marine Engine Fittings, Wrought Iron Welded Pipe, for steam, or high pressure Water and Gas, High pressure Steam and Water Valves, Hydraulic Machinery, Pumps, Closets, &c.; Stocks, Taps, and Dies, Chandeliers, and Patent Metallic Bedsteads.—Walsall.

The PRIZE MEDAL for SUPERIOR PATENT SASH and BLIND LINES, was awarded to JAMES AUSTIN, at the INTERNATIONAL EXHIBITION, 1862.

AUSTIN'S IMPERIAL PATENT SASH and BLIND LINES.

To BUILDERS, CARPENTERS, and BLIND MAKERS.

J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his

IMPERIAL PATENT FLAX SASH-LINES

of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.

ESTABLISHED 1774.

PRIZE MEDALLISTS OF THE GREAT EXHIBITION, 1851. } **BUNNETT & CO.** { ORIGINAL PATENTEES AND MANUFACTURERS.

ILLUSTRATED PROSPECTUSES AND TESTIMONIALS FREE BY POST ON APPLICATION AT 84, GRAY'S INN LANE, HOLBORN, LONDON.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Baryte from ten to thirty per cent. Whether sold under the name of "Improved Zinc Paint," or as the number Two or Three qualities, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS. Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,

WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

CONTRACTORS FOR ROOFING THE GREAT EXHIBITION BUILDING OF 1862

By Her Majesty's Royal Letters Patent.

F. McNEILL & CO. of LAMB'S BUILDINGS, BUNHILL ROW, LONDON,

Manufacturers and ONLY Patentees of

THE PATENT ASPHALTED FELT, FOR ROOFING HOUSES, VERANDAHS, SHEDS, &c.

Patronised by

HER MAJESTY'S WOODS AND FORESTS,
HER MAJESTY'S COMMISSION OF CUSTOMS,
HONOURABLE EAST-INDIA COMPANY,
HER MAJESTY'S WAR DEPARTMENT,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANICAL GARDENS, REGENT'S PARK.

And by the most eminent members of the Royal Agricultural Societies of England, Scotland, and Ireland, at whose great national shows it has been exhibited, and OBTAINED THE PRIZE, for being the best and cheapest article for roofing, also used for under slates at the Royal Agricultural Society's House, in Hanover-gate. Its advantages are lightness, warmth, durability, and economy. It is impervious to rain, snow and frost and a non-conductor of heat and sound. The Felt can be cut to any length, by 32 inches wide. The price is only ONE PENNY PER SQUARE FOOT. Samples, with full directions as to its use and the manner of applying it, with TESTIMONIALS, some of them of seven years' experience, from Architects, Builders, Noblemen, and Gentlemen, who have extensively used it, sent free to any part of the town or country. DRY HAIR FELT, for covering Boilers, &c., is now manufactured, by which a saving of about 25 per cent. in fuel is effected. The TRADE are respectfully invited to send their orders DIRECT to the FACTORY, as the shortest means of being supplied with a good article, and consequently best suited to the Trade. The original works where the above roofing is made are F. McNEILL & CO.'s Steam-Factories, LAMB'S BUILDINGS, BUNHILL ROW. Roofs covered with McNEILL'S FELT, to be seen at the CAMPS of ALDERSHOT, CURRAGH, SHORNCLIFFE, and COLCHESTER (upwards of Three Millions of Feet); also the GREAT EXHIBITION BUILDING (1851), of near One Million Feet. A Liberal Discount allowed to the Trade.

"Where Archbishop Whately takes the Rise, Progress, and Corruptions of Christianity, Bunsen, the subject of Luther and the German Reformation; M'Culloch, Money, Political Economy, and the cognate subjects; Macaulay and De Quincy, their selected Biographies; Donaldson, Philology; Owen, Palæontology; Herschel, the Telescope; Robert Stephenson, Iron Bridges; Bazley, cotton; Fairbairn, Iron Manufacture; and other men, for the most part the work to which they were most competent—the reader may grasp a notion of the grand work of reference which is now placed before him."—*The Times.*

"An Encyclopedia like this is worth a library."—*Examiner.*

"The work as a whole is so well sustained that it is almost impossible to distinguish the fixed stars, or those articles which will be established for ages as standards, for model and reference, from the comets, or those whose brilliancy of diction and highly-coloured fancies dazzle the mind, and for a time fascinate the attention; and from the planets, those heavy-laden orbs, which plod their customary rounds with little variation; or those articles, the value of which is their plain and practical use in the daily unromantic round of commonplace existence. It need only be said, that the galaxity of talent provided is complete."—*Glasgow Herald.*

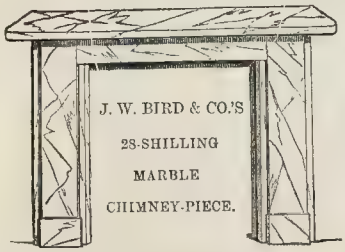
"Its excellence renders it so indispensable as a work of reference, that no library of any pretensions can do without it."—*Gentleman's Magazine.*

"This is not a book, but a library. Wanting the 'Encyclopædia Britannica,' the book-case would be very imperfectly furnished; having it, there is need for few volumes besides to supply the requirements of the student. It is not a work to be kept *merely* for reference; it is for reading also; and not only for profit, but for pleasure. Learning there is in abundance in its pages; but it is mingled with no small quantity of amusement."—*Critic.*

EDINBURGH: ADAM & CHARLES BLACK. LONDON: SIMPKIN, MARSHALL, & CO.

BATH STONE OF BEST QUALITY.

RANDELL & SAUNDERS, Quarrymen and Stone Merchants, Bath.



List of Prices at the Quarries and Depôts, also Cost for Transit to any part of the United Kingdom, furnished on application to BATH STONE OFFICE, CORSHAM, WILTS.

BATH STONE OF THE BEST QUALITY.

PICTOR & SON, Quarry Proprietors and Stone Merchants, Bath.

Lists of Prices at the Quarries and Depôts, also Cost of Transit to all parts of the Kingdom, forwarded on application to BATH FREESTONE WORKS, BOX, NEAR CHIPPENHAM, WILTS.

MARBLE & STONE CHIMNEY-PIECES FOR THE MILLION.

PRICE LIST ON APPLICATION.

A Stock of 500 always to choose from at

J. W. BIRD & CO.'S, THE EMPORIUM,
145 & 143½, EUSTON ROAD, N.W.

A Marble Box Chimney, with 8-inch piers, as illustrated, for 28s. and fitted to any opening up to 3 feet square.

STONE DITTO, WITH BEAUTIFUL MOULDED CAPS, FOR SEVEN SHILLINGS.

Monuments and Tablets in great variety, equally low in price.
Masons' Work of all kinds contracted for and executed with despatch, in Town or Country.
A VACANCY FOR AN OUT-DOOR APPRENTICE.

VIEILLE MONTAGNE ZINC.

THE ITALIAN-FORMED ZINC is much approved of by Architects and Engineers on account of its strength, durability, and appearance. On account of the light framing required, roofs, including framework and fixing, can be covered with it FOR £3 PER SQUARE up to 25 feet span. Sheds of larger span, including posts, 4*l.* per square. Architects are cautioned against allowing anything thinner than No. 13 gauge (20 oz.) to be used. ALL PLATES SHOULD BE REJECTED NOT BEARING, in addition to the Company's name, the words "ROOFING ZINC," and the gauge. OLD ZINC RETAKEN AT HALF THE MARKET PRICE OF NEW.

For Designs and Estimates for Roofs, with Timber or Iron Framework, IRON CHURCHES COVERED WITH ZINC, and Buildings for the Colonies, apply to

THE COMPANY'S SURVEYOR,
12, MANCHESTER BUILDINGS, WESTMINSTER, S.W.

The Builder.

VOL. XXI.—No. 1047.

The Royal Mausoleum at Frogmore.

WE are graciously enabled to present to our readers the plan and elevation of a building of which only fragmentary and unauthorized notices have hitherto appeared; but it is one in which all who revere the memory of the lamented Prince Consort must feel a deep and painful interest.

Early in January last year, Professor L. Gruner and Mr. A. J. Humbert were honoured with the Queen's commands to prepare designs for a Royal Mausoleum to be erected at Frogmore. One condition was especially imposed by Her Majesty; viz, that the central portion of the structure should be roofed in and substantially completed in the course of the year. Towards the end of January designs were submitted and approved. On the 15th of March the foundation-stone was laid by the Queen; and the dome over the central octagon was turned about the middle of October. The building was consecrated by the Bishop of Oxford in the presence of Her Majesty and all the members of the Royal Family on the 17th of December; and on the following day the mortal remains of his Royal Highness the Prince Consort were removed from Windsor, and placed in a temporary stone sarcophagus in the new edifice.

The mausoleum, as will be readily gathered from the accompanying plan and perspective view,* is in the form of a cross; the arms (or limbs) of which are of equal length; with the addition of a porch on the eastern side.

Externally, the breadth is 70 feet, and the length 80 feet. The extreme height from the general level of the ground to the top of the cross is 83 feet; and the height from the floor of the structure to the top of the central roof, exclusive of the cross, is 70 feet. Internally, there is a central octagonal chamber, 30 feet in diameter, and 65 feet high, roofed with an octagonal dome: each arm of the cross is 16 feet square.

There are connecting corridors or passages at the back of the four main supports of the dome; giving access to each of the arms of the cross, independently of the central portion of the structure.

The floor of the building is raised considerably above the ground; and beneath is a vaulted crypt or chamber, to which access is gained by descending a narrow winding staircase in the thickness of the wall, near the entrance doorway. This crypt was constructed for the purpose of insuring the dryness of the superstructure, by obtaining a free current of air beneath it.

The exterior of the building to the height of about 10 or 11 feet is faced entirely with granite, and above this with Portland stone and granite. The walls are of unusual thickness, and constructed in the most solid manner, a large proportion of the stones weighing from one ton to one ton and a half, and some as much as from three to four tons. All the external columns are of polished granite.

The interior of the building will be faced with coloured marbles and serpentines, combined with frescoes and other decorations. Keeping in mind the deep and incessant interest taken by the Prince in the development of the material productions of this and other countries, there was an anxious desire on the part of those who had been intrusted with the construction of his tomb to avail themselves to the utmost of all such materials suited to the purpose as could be readily procured, more particularly from the British dominions. Thus the woodwork is of Indian teak, the roofs of Australian copper: Wales and Ireland contribute a variety of marbles: Scotland and the Channel Islands supply granite; whilst England is represented by her Portland stone, her granite from Devon and Cornwall, and her Cornish serpentine. Belgium, France, Italy, Greece, and Portugal,* also furnish marbles to enrich the interior of the edifice.

It is intended that a large sarcophagus, of dark grey Aberdeen granite, should occupy the centre of the structure under the dome. The sarcophagus will rest upon a step of polished black marble, with kneeling angels in bronze, at the four angles; and upon it will be placed a recumbent statue of the Prince Consort, in white marble. This work is now being executed by Baron Marochetti, who has been honoured with her Majesty's commands to prepare and carry into execution the design. In this double sarcophagus it is intended that ultimately the Queen's remains shall likewise be deposited by the side of her beloved and deeply lamented Consort; and a recumbent statue to correspond with that of the Prince will be placed next to his. Long may this be wanting!

On the upper part of the bronze door-frame, in the porch, will be the following inscription:—

ALBERTI PRINCIPIS QVOD MORTALE ERAT
HOC IN SEPVLCRO DEPONI VOLVIT
VIDVA MŒRENS VICTORIA REGINA
VALE DESIDERATISSIME! HIC DEMVM
CONQVIESCAM TECVM
TECVM IN CHRISTO CONSVRGAM.

The central portion of the structure is the only part at present roofed in: temporary brick walls have been erected under each of the four large arches supporting the octagon and dome above; forming a chamber complete in itself, 30 feet in diameter, and 65 feet high, in which the stone sarcophagus is placed.

The external walls, owing to delays arising from the difficulty experienced in obtaining the marble and granite, are yet far from being complete.

Mr. George Dines, successor to the late Mr. Thomas Cubitt, of Pimlico, is the builder; and Mr. William Thomas, the clerk of the works.

* See pp. 152, 153.

* The Portuguese marble, "Emperor's Red," of unusually fine quality, was a present from the lamented king, Don Pedro, of Portugal.

† See p. 131, *ante*.

NOTES ON THE PROPERTIES OF WOOD.†

TREES cut in summer give lighter wood than when felled during winter time. The cause for this may probably be ascribed to the fact that in winter a large amount of nourishment is stored in the stem which, during the spring and summer, is spent for the formation of bloom and leaves.

We call hardness of the wood resistance which it opposes when another body enters it. If wood were an equal body like minerals, we should be able to determine its resisting power or hardness; but it being differently built, and, whilst trying its hardness, other properties interfering, we cannot arrive at a decisive result.

Sometimes a wood has very hard fibres but very little body; that is, it is lighter built than another wood with soft fibres and a full body: it is therefore unadvisable to judge the hardness of a wood according to its fibres. Experiments to ascertain its hardness should be made across the stem and not upon a longitudinal section; and although there is no instrument which leads us at once to a definite result, we can generally arrive with a saw at a fair conclusion. Many persons constantly employed on wood are of the opinion that it becomes harder if it is worked or barked whilst green.

Wood, as a porous body, contains in its natural state—whether dead or alive—a certain amount of moisture: by the loss of that moisture or increase of the same the bulk of the wood either contracts or expands.

If we have a piece of wood when this action takes place only upon one side, it is obvious that the piece will alter its form or shape.

The consequence of the loss of moisture is also the warping and splitting of the wood. The inner structure of a stem is irregular: for instance, we find the inner moisture of a yearly ring to be more than on its outer side: this causes the splits on the exterior, after the wood is dry; and it also accounts for the impossibility to form out of green wood a regular body which could not lose its weight or shape. The time during which the evaporation of the moisture takes place depends upon the state of the atmosphere. Several authors are of opinion that the contraction is regulated by the specific weight. This, as a rule, cannot be adopted: for instance, lilac and oak both being heavy and hard, contract quickly, whilst the double American maple, which is equally hard, contracts slowly. It is evident, however, that the fuller of sap a tree is the greater will be the contraction. This will account for the fact, that we find on cut timber the cracks extend from the exterior towards the centre, because the sapwood will contract more than the heart-wood.

Planks turn with their sides upwards; that is, the edges rise from the level of the centre line. This explains why we turn the inside of a plank towards the joists whilst we lay a floor, which prevents the twisting. The contraction and action of the wood cannot be checked altogether. Among the means to prevent it stands foremost the one of putting the tree into water; but when taken out it must not be stored in a place where it dries too soon, as it still would burst if done; nor must it be left too long in the water, as this will injure the quality of the wood.

All the wood which is used is never quite dry: besides this, it works a little in itself under the changes of the atmosphere; and therefore attention must be paid to the selection of the timber for the same purpose, for the heart-wood is less subject to such action than sap or splint wood. This is an important point with the furniture makers. The expansion or contraction is less apparent in the length of the fibre than in the cross section of the wood.

The elasticity of the wood is called its property of return to its original form and shape after such have been altered by another cause. With this quality is connected the valuable fitness of some woods to transmit sounds, for which reason they are much used by instrument makers. The elasticity has its limit; and the more a piece of wood can be bent without breaking the greater its elasticity.

The resistance of wood depends upon the three following conditions:—1st. Two pieces of equal length and height offer different resistance with reference to their breadth. 2nd. Two pieces of equal length and breadth offer different resistance with regard to their height. 3rd. Two pieces of wood of equal height and breadth offer different resistance with regard to their length.

Again, experience has proved that a piece of wood resting freely with its two ends will carry from one-third to one-half less weight than if the ends are fixed or built in a wall. Old wood has less elasticity than young, and heart-wood is less elastic than sap-wood. The same difference is found with wood from the lower stem compared with that from the upper crown. The elasticity diminishes with the progress of the specific dry weight. Square-cut timbers laid horizontally with their yearly rings have not by far such bearing power as when laid perpendicularly.

Green wood has considerable elasticity. Young stems, although they suffer sometimes by the wind, will regain their original position in a short time. Here it is necessary to mention that where young stems or branches have been bent through snow for a longer period, they will not return to their former form.

I submit to you the following as the result of some experiments relative to the bearing capacity of various woods. The pieces were all 3 feet long

✠

and 2 inches by 1 inch, and air-dry. The constants arrived at were the following:—

	Constant.	Wet.	Weight. per C. Ft.
Yellow Pine	358·5		25 687 lb.
Baltic Pine	444·		29·062 ,,
Red Pine	467·		33·437 ,,
Ash	517·75	55 875	41·812 ,,
English Elm	595·25		37·312 ,,
Pitch Pine	629·		45·750 ,,
American Elm	631·5		45 412 ,,
American Oak	653·5		44 875 ,,
African Teak	673·5		50·562 ,,
Mora	691·		71·250 ,,
Sabicu	854·25		59 687 ,,
African Oak	869·5		
Green heart	1,079·5		69 750 ,,
English Oak	—		53·312 ,,
Indian Teak	—		38·125 ,,
Iron Wood	—		73·500 ,,
English Larch	—		32·562 ,,

Formula to find the breaking-weight of a piece of timber:—c constant, b breadth in inches, d depth in inches, l length in feet, w breaking-weight in pounds.

$$\frac{c \quad b \quad d^2}{l} = w.$$

The adaptability of green heart for hydraulic construction, dock-gates, &c., cannot be over-estimated. I refer you to an instance where a clough was taken out of a sewer after sixteen years: it had been made half of oak and the other half of green heart: the oak was completely worm-eaten, whilst the green heart was in its original condition. This certainly contrasts with the fact mentioned by Mr. Burnell in his paper, that he has a piece of green-heart riddled by the teredo; and it would be interesting to ascertain under what circumstances the teredo will attack or not attack this kind of wood. My experience proves that green-heart is exempt from the therosion by the teredo; but there is a mollusc in this timber which we find alive in it as the same arrives here from the West Indies. The worm is found in sizes from the lymexylon to the teredo; but is of a different species, and seems not to live in this wood when used in such constructions as dock-gates, &c., in this country. Green sapwood will not retain its form and bend if it is suspended horizontally by its two ends.

The same will occur in timber constructions where green wood has been used. I may mention that the artificial process of drying wood should not be extended beyond 10 per cent., because it will cause it to become brittle and totally useless. A close examination of a beam supported by its two ends will tell that the upper half of the fibres are stowing while the lower fibres are extending. The centre of gravity lies in the middle of the cross section. All woods do not offer the same resistance, and we can increase it by strengthening the centre of gravity. M. Duhamel describes in his work, "De la Force des Bois," the following experiment in elucidation of this fact: he took twenty-four sticks cut from young willows of equal strength: each stick was 3 feet (Paris) long, and 1½ inch square. Six of these broke in the centre, with an average weight of 256·909 kilogrammes (1 kilogramme equals 2·205 lb. English). In two other pieces he made a cut across ½ inch deep in the centre, and filled it out with a piece of oak: they broke with an average weight of 269·718 kilogrammes. Two more were cut ½ inch deep, and otherwise treated in the same manner: they broke with 265·312 kilogrammes. Five were cut ¾ inch, and broke with 259·761 kilogrammes. From this it results that the smaller piece of harder wood, fixed across the centre, considerably increased the strength of the stems when put in half and even three-quarters of the thickness. It is also the reason why a beam composed of several smaller pieces will bear as much as if of one entire piece. And again, as the bearing power of the timber varies, some advantageous results may be obtained by putting stronger and weaker wood together in a construction.

A round or square piece of a stem will offer about the same resistance from each side; but if we compare a timber cut with the yearly rings vertically with another having the rings horizontally, we find that the former will bear more than the latter.

The sap which protects the wood does not prevent its decay. Turpentine, which is often in the sap, prolongs the preservation of the fibre. According to Baron Liebig, the decay of wood takes place in the three following modes: first, oxygen in the atmosphere combines with the hydrogen of the fibre, and the oxygen unites with the portion of carbon of the fibre, and evaporates as carbonic acid. This process is called decomposition. Secondly, we have to notice the actual decay of wood which takes place when it is brought in contact with rotting substances; and the third process is called putrefaction. This is stated by Liebig to arise from the inner decomposition of the wood in itself: it loses its carbon, forms carbonic acid gas, and the fibre, under the influence of the latter, is changed into white dust.

As an example of this, I refer you to the wooden ceilings of houses which after some time go into that state. The chief cause is, that the free access of the air to the wood is prevented, and the little dampness occasioned by washing is sufficient to promote the dry rot.

The sap of wood contains partly saccharine matter, which will naturally decompose in itself, and this is noticed in timber stores from the sour taste and smell of such woods.

The actual time which wood lasts depends in a great measure on the time when it was felled, and in how far the soil in which it grew was suitable for its development.

As a rule, the wood cut in summer is less durable than that felled during the winter months.

It will also be the case with trees which remain a longer period before their removal in the forest after being cut; however, a great difference does not exist between ripe woods, whether they are felled in the summer or winter time, because the felled in the summer or winter time, because the sap wood and the bark of the tree; therefore, if the sap wood is cut off and the heartwood is properly treated and seasoned, the quality of the summer wood would be equal to that cut in winter time. In support of this I mention, that most of the trees in Southern Italy are felled in July and August.

The pines in the German forests are cut down mostly in summer time, and their wood is generally very sound. The notion that this causes dry-rot must remain out of the question, for I believe whenever such takes place it is in consequence of unseasoned timber being used. Considering the large quantity of timber imported into this country, I must mention that my experience tends to show that the North American woods, with the exception of red pine, are less durable than those from the north of Europe. The latter are stronger, superior, and not so much subjected to dry-rot as the former.

In the earlier portion of this paper I had occasion to mention some enemies of the wood which attack it whilst growing: it is lucky that they are combated and destroyed to a great extent by other animals in the forest; and, among those doing great service in this respect let us remember the woodpeckers, finches, swine, hedgehogs, badgers, frogs, and many others.

Dry or dead wood has also some terrible foes, which at times cause alarming ravages; and unfortunately no effectual means have as yet been found to check them: the most dangerous of them are the termites, the lymexylon, the sirex gigas, the teredo, and the lymnoria terebrans.

It is sometimes difficult to distinguish good from bad timber, and I beg to draw your notice to some illustrations from a work published by the French Government,—"Instructions sur les Bois de Marine," with special reference to the oaks, and to which the following explanation may serve:—

Plate 43, figure 1, represents meagre or better known as English oak, of the best quality. To this kind of oak belong the *Quercus pedunculata*, and the *Quercus sessiliflora*. The fresh cut of such is a yellow straw colour, sometimes of a rose colour. The annual rings show a fine glossy grain, which allows it to take a fine polish. The horny layer of three to five millimetres is quite distinct from the cellular portion, and the pores are very little to be seen.

This kind of oak is very sensible to the influence of the atmosphere. In damp weather it swells, and in a dry temperature it contracts considerably. This makes it liable to split; but notwithstanding this it is excellent wood, and the best suited for the ribs in a ship. The fibres hold together with a great longitudinal and even transversal tenacity, which gives it a great resisting power.

Plate 43, figure 3, shows the cross section of an inferior quality. It is spongy; has large pores of a pale colour, sometimes brown or reddish; its deficiency has been caused by too wet a soil, by want of nourishment, or of fresh air, or of any other condition requisite for its full development.

If such wood be ruptured it will break clean off, and a fibre may be rubbed into dust between two fingers. A valuable property of this kind of oak is, that it alters very little by the changes in the atmosphere, and it is therefore much in use for floors, furniture, and carpentry.

Between these two qualities of oak, range a great number of others, differing in their condition.

When trees are found to be vicious at the trunk, it must be attributed to an interruption of the functions of the roots. It will occur that one or several of the roots die, by which putrefaction is imparted into the lower part of the stem. If this rot be white or black, it is not very dangerous: it does not generally reach more than 1 foot above the roots; but when this rot is of red colour, the wood should not be used in construction, or it will soon lead to decay.

Trees arrive at an age when their wood becomes ripe, and then it is time to fell them. It may be seen when the top of the tree brings forth no leaves in spring. Such trees are superannuated; that is to say, they grow no longer; and then they become subjected to a serious evil called the dial. This is explained by the following process:—We know that with a vigorous tree in full growth the heartwood contains the smallest portion of water, and that its density decreases from the centre towards the circumference: when it is felled and dried it will split from the outer side towards the centre. This is not the case with a superannuated tree, in which the oldest wood begins to perish first; and consequently the greatest density lies between the heartwood and the bark. Now, in such a tree the central wood contracts while drying, which causes the splits. Sometimes splits are found in trees which bear a glossy blackish aspect, and they must be distinguished from those just mentioned. They extend from the circumference towards the heart, and were created whilst the tree was growing. It is asserted that they are effected by frost. They look at first straight or capillary, and enlarge with each heavy cold. They show themselves mostly longitudinally, on a swelling of the stem, and make the tree useless.

The splits in the heart of a tree must not be confounded with holes caused in falling. There is no danger with the latter beyond that they diminish the length of the timber.

Often in the trunk of a stem a particular irregularity is found in the non-juxtaposition of two successive annual rings.

This fault is caused by strong winds, which affect it in the point where the flexion of the stem has its maximum.

It will also arise when the tree has not sufficient nourishment, by which two layers are prevented from growing well together. It shows itself in incomplete dark rings. If these are only in the sapwood they may be looked upon as unimportant; but when they are, on the contrary, in the heartwood, and accompanied with the dial, they betray a serious vice in the tree.

In different cross sections of an oak we often notice circular bands of a different colour from the remainder of the section, sometimes white, yellow, red, or brown. The texture of these bands appears loose, even spongy, and betrays signs of decomposition. It is found in the best qualities of wood, and it cannot be cured. The reason for this decay is not definitely known. Some persons suppose it to arise when the sapwood is prevented by severe cold from developing itself into good wood. When this evil is in the heart, it looks like a whitish circle, and is called the moon. Wood from such trees ought not to be used, because it will soon decay. When the vicious bands are straight, and the shades of colour are less observed, the vice is not so dangerous.

Druxy knots are caused by woodpeckers, by lopping, and by dead and broken branches, which make holes into the tree: into these the water runs, decomposes, and directs the evil towards the inner stem. If we find on a tree a swelling or depression, we may conclude that the condition of the tree is bad. Such trees are often found with the sap running out of their armpits. Among the various rots engendered by the knots we have the following:—

Wet rots are composed of porous fibre running from the knot into the trunk of a tree. This rot is of brown colour, and has an offensive smell.

This evil is often found with white spots, the latter of watery substance. When it has yellow flames it is very dangerous. Black coloured knots are easily cured, and unimportant.

We find wounds on trees which have been effected by the fall of a neighbouring tree or by the friction of a cartwheel through which the rind was torn. If this wound does not reach beyond the bark, it has no bad effect upon the wood; but should it have damaged the ligneous portion of the stem, the wood takes soon a green-like colour, and begins to decompose.

It occurs that a new rind grows over such wounds, and in such instances the evil is not detected until the stem is cut into timber. Similar defects are also caused by lightning.

As a very elaborate work upon the various kinds

of oak, I mention Kotschy's, Eichen Europa's, *Durability and Preservation of Wood*.

Well-seasoned timber will last for an indefinite period if kept in dry air or under water; but when alternately exposed to atmosphere, water, and light, it begins to decompose. The ordinary causes by which this is effected are chiefly the fermentation of the azotic substances contained in the cellular tissue. This is developed under the influence of the oxygen in the atmosphere, and by the moisture contained in the wood. We have therefore the problem to find means to prevent this fermentation, either by obviating all such circumstances as air and water, or to extract from the wood its vegetal albumen, or to act upon the latter in a manner that it resists fermentation, and also the attack of insects. No process has as yet been invented which answers to all these conditions, and with all trials we must have the assistance of chemistry and entomology.

I refer to our museums as the place where, among other rude-made articles, here and there is left a remnant of wood which bears the ages of decenniums, and other specimens of petrified wood which must have been in existence in its natural state centuries ago.

That wood in sandy soil will last for centuries may be seen in the specimens which were dug up whilst making the new docks at Birkenhead, from depths varying from 8 feet to 32 feet below the surface, and they are reckoned to have been there for centuries.

Among the many inventions to preserve wood, those of England have proved the most successful. Already in 1737 a patent was granted to Mr. Emerson, to prepare timber with hot oil, and soon after the methods of Oxford and Kyan came into use.

In 1837 a patent was taken out by Margary, to impregnate wood with sulphate of copper; and since 1838, Sir William Burnett's system, chloride of zinc, was also used.

Mr. Payne obtained a patent in 1841 for preparing wood with two solutions, such as carbonate of soda and sulphate of iron. Some very good results are obtained with this system, but it must be done with the greatest care.

Still better is the invention patented by Mr. J. Bethell, which consists in the injection of oil of tar after the air has been extracted. This process is effective to a great extent, and for a full description I refer you to Mr. Brunell's paper, read before the Society of Arts, in London, 1860.

The disadvantage with the creosoting system is the offensive smell and the increased danger by fire; but it is recommendable for railways and hydraulic works.

In France the price of creosote is too high to admit its general use; and solutions of metallic salts are used instead. Among these M. Boucherie's method has obtained the best results. He acts with a pressure of 5 or 7 feet of water upon wood not later than two or three months after it is felled, and injects a solution of sulphate of copper by a transversal section, while the sap runs out in the opposite direction. Railway sleepers prepared in this manner were laid down in 1846; and in 1853 they were in such good condition that ever since M. Boucherie's system is much applied in France. Another economical process of Mr. Fontenay is worth mentioning. He acts upon wood with what he calls metallic soap, which he obtains from the residues in greasing-boxes of carriages; also from the acid remains of oil, suet, iron and brass dust, which are all melted together.

A piece of wood was put in such a hot fluid for forty-eight hours after the water had previously been partly extracted under the ordinary pressure of the atmosphere. When taken out the metallic solution which it had taken up stood at 3 per cent. to its first weight. This piece of wood was used as a railway sleeper on the Orleans Railroad, and after eight months it was in perfect condition, whilst other wood not treated in similar manner was in a state of decomposition.

Another process is the following, recommended by Mr. Dondeine, and much applied in France and Germany. It is a paint, consisting of the following:—

Linseed oil	15	kilogrammes.
Resin	15	,,
Tar	5	,,
Zinc or white lead	12	,,
Vermillion, red or yellow	10	,,
Colour (clay colours must be avoided as they thicken too much)	4	,,
Cement	6	,,
Oxide of iron	6	,,
Gutta percha, glue, or gum	2	,,
Hydrate of chalk	6	,,
Lard	15	,,
Litharge	2	,,

One kilogramme = 2,205lb. English.

All these are well mixed, and reduced by boiling to one-tenth. When applied warm it may be used with a brush; but not too hot. It may also be used cold; in which case the paste must be mixed with a little varnish or turpentine oil. The results obtained with this process are reported as yet very satisfactory. It prevents decay, and admits no humidity.

Mr. Dondeine further reports that it prevents oxydation of iron; and wherever walls have had a coat of this mixture it has kept away all wet, and unpleasant insects, ants, bugs, &c. Roofs of pasteboard or of wood which have been painted with the mixture keep dry, and withstand the effects of rain and snow.

Wood impregnated with sulphate of copper will not last longer in sea-water than other wood. It is quite as much attacked by the sea worm as when in its natural state. On the other hand it has been proved that wood impregnated with sulphate of copper will have longer durability in the soil than when either tarred or charred.

The following statement of M. Brouzet to the French Academy may also be of interest. He has a seat in the Carennes Mountain, where he cultivates silk-worms. The shelves upon which they breed are of pine. During the period from 1853 to 1858 all his crops perished through illness. In 1860 he was induced to make new shelves of pine impregnated with sulphate of copper, and ever since the silk-worms have been in the finest and healthiest condition. (See "Comptes rendus de l'Academie Française," vol. 54).

At Saint Sebastian, in Spain, the piles of a wooden bridge standing in the sea have been guarded against the attacks of sea-worms in the following manner. Each pile is surrounded by a wooden box, and the space between filled up with cement. After six years it was proved that the piles were in perfect condition, whilst the outer boxes were completely riddled by the worms.

With these I conclude the remarks on wood, and will next consider some works which have been constructed in that material.

JOS. JUSTEN.

"MATHEMATICS FOR PRACTICAL MEN."

THE work which forms the basis of the one before us,* was first published by Dr. Gregory in 1825, and passed into a second edition. In the year 1847 the third edition was published under the direction of Mr. Law; but the mathematical sciences having greatly advanced during the twenty-two years which had intervened since the first edition appeared, it was found necessary not only to enlarge but also to re-write a large portion of the book. A section on the use of logarithms, with copious tables, was added to the chapter on Arithmetic. Much new matter was also added in that on Algebra; and the chapters on geometry, mensuration, trigonometry, and conic sections, were almost entirely rewritten. The sections on the steam-engine and the strength of materials received large additions, these subjects having had but little attention from mathematicians when the first edition appeared. The present work is in reality a second edition of that issued by Mr. Law, with but little alteration beyond the correction of typographical errors.

The object of the author was not to teach mathematics to those who were desirous of becoming mathematicians, or to supersede the usual text-books in which the various branches of the science are accurately demonstrated; but to impart a knowledge of the principles of physics, and their practical application, to those whose acquaintance with mathematics is very limited, and who have not the opportunity of taking up the study, but whose avocations nevertheless require that they shall be able to apply mathematical formulæ, or to work out the many geometrical problems which occur in the arts of common life. This work is more especially intended for the use of the engineer or architect, who here finds ready to his hand rules for solving nearly every mathematical difficulty that may arise in his practice. As a moderate acquaintance with arithmetic, algebra, and elementary geometry is absolutely necessary to the proper understanding of the most useful portions of this book, the author very wisely has devoted the first three chapters to those subjects, so that the most ignorant may be enabled to master the whole of the book without aid from any other. The rules given are in all cases explained by means of examples, in which every step of the process is clearly worked out.

In the chapter on practical geometry, we find rules for setting out curves, polygons, &c. For instance, the radius of the circumscribed circle of any regular polygon of from 3 to 12 sides, being given, its area and length of side are found by multiplying the given radius by the number found in the table against that particular form of polygon. Thus, if the radius of the circle is 10, then $10 \times 0.765367 = 7.65367$ is the side of the inscribed *octagon*. For the *decagon* the multiplier is ·618034, and for the *dodecagon* it is ·517638.

Under the head of mensuration we find rules for measuring the *area* and *periphery* of the conic sections, and also the contents of various forms of solids. The rule given for the area of an ellipse is, multiply the transverse by the conjugate diameter and again by ·785398. The periphery or circumference is found nearly by multiplying the *sum* of these diameters by 1·57079.

The chapter on trigonometry would have been much simplified if the editor had adopted the now almost universal method of treating *sines, cosines*, &c., as *ratios* instead of *lines*. One of the simplest applications of trigonometry is to the finding the height of any building without actual measurement. Let BC be the height, A the position of the observer, who measures the angle BAC by a theodolite; then $BC = AB \times \tan. BAC$; or log. BC = log. AB + log. tan. BAC; log. tan. BAC being found in the tables. The only linear measurement required in this case is the horizontal distance AB. Other rules are given for solving more complicated questions of heights of inaccessible buildings and those on the top of hills, such as will often occur in the practice of the civil or military engineer; also for approximate measurements of heights by the length of the shadow cast, by reflection in water, by the barometer, and by the velocity of sound.

In all mathematical works the *conic sections* have always had a prominent place. They are the curves formed when a plane is made to cut across a cone, either on the slant completely through the cone, the outline of section being in that case an *ellipse*; or parallel to one side of the cone when the curve is the *parabola*; or parallel to the axis of the cone when we get the *hyperbola*. Their peculiarities and the methods of drawing them are here given, and also those of other curves invented by the Greeks; as, for example, the *conchoid*, which has been suggested as the best outline for the entasis of columns. The *catenary* is the curve produced when a cord or chain is loosely suspended from two points, and is of importance in the theory of suspension-bridges.

The second and by far the larger and more important part of the volume is devoted to the examination of the various subjects known by the name of mixed mathematics, which is the application to physics of algebra and geometry. After giving a concise account of the mode of applying mathematics in the science called mechanics, we have the general application to the equilibrium of structures, as in the case of walls or piers sustaining a thrust. For example, let a wall be 39·4 feet high, of material weighing 125 lb. per cubic foot, to sustain a horizontal strain of 9,900 lb. on each foot in length applied at its summit: what must be its thickness at the base to prevent its being overthrown? The formula in this case is,—

$$\text{breadth} = \sqrt{\frac{2 \times 9900}{125}} = 12{\cdot}58 \text{ feet.}$$

The formulæ for the pressure of earth against walls are more complicated, but are such that a moderate knowledge of algebraical rules will suffice for their application. We also find a useful table for the thickness of walls with vertical faces supporting the pressure of different kinds of earth:—

Nature of Earth.	Thickness of wall, its height being 1. Wall of brick 109 lb. per cub. ft.	Wall of un-hewn stone, 135 lb. per cubic foot.	Wall of hewn freestone
Vegetable earth, carefully laid course by course	·16	·15	·13
Clay, well rammed	·17	·16	·14
Earth mixed with large gravel	·19	·17	·16
Sand	·33	·30	·26

We think that the subject of the "Stability of Arches" deserved better treatment than it has received in this book; a couple of pages only being devoted to one of the most important and abstruse problems which the architect has to solve; and what is said on the subject might as well have

* "Mathematics for Practical Men." By Olinthus Gregory, LL.D., F.R.A.S., enlarged by Henry Law, C.E. Fourth edition, revised by J. R. Young. London: Lockwood & Co. 1862.

been omitted altogether, for any benefit it can be to the "practical man."

The next subject considered is that of the simplest kind of machinery, called *the mechanical powers*; these are seven in number, and form the basis of all other machines, simple or compound; they are, the lever, wheel and axle, toothed wheels, pulleys, inclined plane, wedge, and screw. Each of these has a certain *weight* to move by means of a certain *power* applied by the hand of the operator; and the number of times that the *weight* contains the *power* (each expressed in pounds), is called the *mechanical advantage* of the machine. In the case of complicated machines, the *mechanical advantage* of the whole machine is the *product* of the *mechanical advantages* of the separate or simple machines of which it is composed.

The chapters on Hydrostatics and Hydrodynamics (or the properties of fluids at rest and in motion) contain many formulæ and tables of great use to the hydraulic engineer. Under the head of Pneumatics we find a formula and table for measuring the force of wind on surfaces, when blowing at various velocities. The pressure in pounds on every square foot of surface produced by the wind blowing perpendicularly thereon at a velocity v, measured in feet per second, is $\cdot 002288 \times v^2$. For example, when the wind is blowing at the rate of 10 miles an hour, or 14·67 feet per second, the pressure on each square foot of surface is nearly $\frac{1}{2}$ lb.; when at the rate of 20 miles per hour it is nearly 2 lb.; at 45 miles per hour it is nearly 10 lb.; and at 100 miles per hour it is 49 lb.

The theory and practice of the steam-engine is very thoroughly discussed, and many elaborate formulæ given for calculating the power of various kinds of engines. From these may be ascertained the velocity of the piston in feet per minute; the quantity of water, in cubic feet, evaporated by the boiler per minute; and the effective useful work performed per minute in pounds raised 1 foot of height. Also the quantity of coal consumed, and the horse-power. The power of a horse is assumed equivalent to raising 33,000 lb. a height of 1 foot per minute.

In the last chapter, on the "Strength of Materials," the author rejects all the rules which have been deduced from theory alone, on the ground that the principles on which the theory is built are erroneous; and comes to the conclusion "that we cannot deduce any general formulæ by which to determine the transverse strength of a beam of any given form of section, without knowing the position of the neutral axis, the limit to which the fibres may be extended before yielding, and the law which subsists between the extension and compression of the material and the force required to produce such extension and compression; upon none of which subjects have we any certain knowledge." Are we, then, to wait until we obtain this 'certain knowledge' before we attempt to calculate the strength of beams? The formulæ given by the most recent writers on the subject do not profess to give the exact strength of every beam to which they may be applied; but, at least, they enable the architect to make his beams of such strength as shall remove all chance of failure. With this prejudice against theoretical formulæ, our author gives only a few empirical formulæ deduced from Mr. Hodgkinson's experiments. Considering the great research into the strength of materials which has been made by eminent philosophers of late years, by whom the subject has almost been exhausted, it appears to us that the rules which have been deduced for all kinds of beams should have been given here, in order to make this part of the work complete, even though the author might have felt bound to add the caution quoted above.

The appendix contains useful tables of logarithms and of various other numbers frequently required in calculations; also a table by which the area, diameter, or circumference of any circle may be seen at once, when any one of these is given. There are also tables of the specific gravity and weight of various building materials. At the end is introduced a paper on isometrical *perspective*, or, as it should more properly be called, *projection*.

This paper was originally published by the inventor, Professor Farish, of Cambridge, in the Transactions of the Cambridge Philosophical Society. The mode of drawing which goes by this name was originally invented for the purpose of representing views of complicated machines, for which it is admirably adapted. It has also been frequently applied to the representation of buildings for which it is useful in certain cases, but was never intended to supersede ordinary perpective. In this system of projection, all lines parallel in the object are also parallel in the picture, and are drawn to the same scale, so that every portion can be measured.

LECTURES ON SCULPTURE IN THE ROYAL ACADEMY.

In commencing his third lecture, Professor Westmacott observed, that if sculpture were an art newly introduced, and only beginning to be studied and practised, it would simply be necessary to direct the young artist's attention to elementary details. As an untried art there would be no established rules or principles for the student's guidance, and the teacher would not only be uncontrolled in his mode of instruction, but would be liable to indulge in every kind of fanciful theory and speculation, the real value of which might be very problematical. This cannot be the case with our present amount of experience and knowledge to guide us. The valuable remains of the various schools of sculpture enable us to derive the most important lessons from long-continued practice; and they afford also a criterion by which we may test the soundness of any teaching offered us. Referring the student to the well-known productions of famous sculptors and schools is therefore one of the safest means of instructing him in the history, the practice, and the progress of his art.

The object of all our exertions and inquiries in this institution is to advance the success of the artist's practice. The special duty of the professor of sculpture is to care for and assist the improvement of those who intend to devote themselves to this art. In constantly bringing before the students the examples of former schools, the object is not to make them imitators or mere mechanics or artisans, but to show them, by reference to facts and examples, the effect of certain modes of practice. By pointing out to them striking characteristics, they may be induced to adopt what is really excellent, and to avoid what can be shown to be defective in any of the works so noticed. No academical teaching can make the artist feel, nor give him the true genius for art: this must be innate. But the student may be taught where to seek the causes of excellence or failure in existing works, and from such experience, palpable to the sense, draw useful conclusions for his own practice.

It must always be remembered that there are two especial grounds of recommendation of sculpture,—one moral, so to say; the other, physical. That is, the first is the object or purpose intended by the work; the second is the mode of presentation; meaning, of course, the form used as the medium of interpretation or expression. For this the best Greek sculpture is universally adopted as a standard, as it unites the finest normal forms with a profound knowledge of nature. This subject having been the theme of the last lecture, need not be further dwelt upon at present.

With the view of examining the chances of restoring sculpture in modern days to a safe and honourable position, it may be interesting and profitable to inquire what is the relation of the best modern to the best ancient sculpture; confining the evidence to the particular subject of the last and present discourse, "Form."

Of the best ancient sculpture account has already been taken. The best modern sculpture, of a great school, with which it may be fair to compare it, is that of the eminent sculptors of the sixteenth century and their followers. In their productions are found a knowledge of the human figure certainly not surpassed by the Greeks, a profound acquaintance with anatomy, facile and perfect execution, and vigour in design. These are very high qualities in art; and yet, no real judge of the essential elements of first-class sculpture would think of classifying these works with the best Greek examples. The cause of this was examined and explained to the students; and in summing up, the Professor showed where the advantage remained. In one the art was lost sight of in the result; and no one thinks of the sculptor. In the other the art is apparent, and the artist is all in all.

The subject of display, in the particular of Form, was considered at length, and especially referred to as a characteristic of later schools, and its danger pointed out; while the absence of effort to obtain notice is observable in all the best Greek sculpture. Here, then, at once, is a discernible difference, and probably a cause for the inferior success of modern sculpture. Illustrations were drawn from the best known productions of both periods; from the Theseus and Ilyssus, and equestrian groups of the sculpture of the Parthenon, on one hand, and from some of the works of Michelangelo, Gio. di Bologna, and Roubiliac, on the other. The fault seems to have arisen from the later schools not restraining themselves in the use they made of Nature, whereby they over-elaborated the parts in their statues; whereas the Greeks exercised the greatest discretion in this, studiously keeping all display of their knowledge of nature subordinate to general beauty and the harmony of the whole work.

It was noticed as a remarkable fact in the history of ancient sculpture that its later schools show a falling-off in style, entirely owing to over-attention to the particular as contrasted with the general. The introduction of portrait no doubt first led to this. Individuality came to be studied, as essential; and the study of larger characteristics no longer ruled practice. The influence of this new feeling was extended to works even of poetical or fancy subjects, and its effect was pointed out in some well-known and deservedly admired ancient works, as the Laocoon, and the statue known as the Fighting Gladiator.

In making these observations, the Professor said he had felt it desirable to draw his illustrations from works that were well known and of a former age, in order that he might not wound modern susceptibilities by bringing more recent productions into court. The object was to assist the students, not to criticize contemporary sculpture. At the same time, attention should be drawn to the tendency to lay too great stress on the minute in the present practice of art, and to the injurious effect it must have on sculpture. In this art the larger and grander features should in preference be studied. The best form does not necessarily imply, or confine the artist to naked form, but whenever and in whatever way it occurs the form should be of the very highest type. If of the human figure, it should be man, not the individual; and if drapery, it should not be a dress of a particular fashion. Of course, mere portrait sculpture must be subject to other influences than those which produce high and beautiful art; and the results will soon be apparent.

It was not intended to disparage what is really valuable in portrait-sculpture, but only to point out how a devotion to individual details may effect the larger views an artist should take in applying himself to the nobler walks of this art.

If sculpture is only to be produced in slavish obedience to the caprice of a public by no means very sensitive or well-informed on the requirements of the art, it will be both formed and dispersed by the mere breath of fancy or fashion. It will have no sure footing. It will be practised mechanically, by half-educated, incompetent, and not over-scrupulous practitioners, simply for the market; but high and noble and beautiful, like the glorious sculpture of the ancients, it never can be when exercised under such depressing conditions.

In the course of the lecture, the Professor said he should endeavour to devote one of the following evenings of his course to a very important inquiry, namely, to the class of subjects fitted for the sculptor's art. He reminded the students of the wide difference that existed between sculpture and painting, and that what one might deal with effectively, with the aid of colour, background, and perspective, the sister art, confined within the limits of absolute form, ought not to attempt, for the result could only be failure. He should think it desirable, then, to offer suggestions on this theme, under the heads of Subject and Expression.

VICTORIA.

Competitions.—Within the last month or two three several competitions have been invited for works in Sydney, New South Wales. First, for warehouse for Iredale & Co., the premium of 100 guineas was awarded to Messrs. Connor & Wilson, of Melbourne. It was highly creditable to this firm that they should call in the best non-competing professional aid to assist in the selection. The building, when erected, will prove a great addition to the street architecture of the sister city, although the requirements of the proprietors rendered it no small difficulty to prepare an elegant front, which would embrace the points they desired. The second competition was for new offices at Sydney for the Mutual Provident Assurance Institute, a very prosperous Insurance Company, on the mutual principle. For this the premium of 100*l.* was awarded to Messrs. Reed & Barnes, also a Melbourne firm. These difficulties of the site have been successfully met in the selected design, which is in the Italian style. For a third Sydney competition, offering two prizes of 150*l.*

and 75*l.*, the designs have been sent in some time. The local papers report that eleven designs were sent in, five of which were selected for the colonial architect to report upon. During a debate in the Assembly on the question of site, it was stated that the only respectable designs were received from Melbourne, and a telegram was published some ten days since, stating that rumour had it that the first prize was to be given to a Melbourne man.

The remains of the heroic explorers, Burke and Wills, are shortly expected in Melbourne, and the committee have invited designs for a marble memorial, to be erected close to the Houses of Parliament, and have accepted the model submitted by Mr. Summers, a gentleman whose abilities have not always met with that appreciation which they deserve; and he has been commissioned to carry out his design, at a cost of 4,000*l.* The principal figures, of course, are the two explorers. Burke is standing with his hand raised above his eye, as though he were looking into the far-off country, while Wills sits at his feet, with his instruments and note-book, ready to take down whatever may be remarked by his leader. Designs have also been received for monuments over the last resting-place, but no decision has yet been arrived at. It is supposed that no competitor has been rash enough to submit a design, to be executed for the limited amount, which will be satisfactory to the committee.

Buildings, &c.—A fresh start has been made with the General Post-office. The present contract will carry the work up to the capitals of the first-floor order. It is understood that the Government have ordered a floating battery, at a cost of 60,000*l.*, to be stationed at the Heads, for protection against the attacks of foreign foes. Mr. Brady, C.E., of Kyneton, has been commissioned to make the necessary survey and plan for the Coliban water-scheme, for the supply of water to the large gold-fields of Sandhurst and Castlemain. He is to receive 2,000*l.*, and will commence at once.

In the Matter of Railways.—The Melbourne (late Suburban) is now getting into good working-order, while the St. Kilda and Brighton has been taken charge of by the mortgagees. The Hobson's Bay Company are applying for extension of their powers in order to enable them to connect their line with the Government and Melbourne and to build a grand central terminus. There is no doubt the Hobson's Bay have the best site for such a purpose; and notwithstanding some show of opposition, it is expected the Bill will pass; unless, indeed, the Government promise to take the scheme up, whilst the directors of the company are willing to retire. On the Government lines two or three accidents have occurred, all arising from the grossest carelessness, but fortunately unattended with loss of life. Two on the Sandhurst line; first, near Chewton, the train running into some contractors' trucks which were left on the line; the second, one train ran into another in broad daylight, shortly after starting, when several passengers were very much injured; and the last, on the Geelong line, through the points of a siding being left open, so it is said. In this last instance, the engine went over into a cutting, and turned upside down, dragging two carriages after it, but fortunately doing little more injury than frightening the passengers. One old lady "thought she would scream, for her heart was in her mouth."

There seems to be a growing disposition to adopt fronts of variegated brick instead of stucco. The last put up in Melbourne is a new front for Tankard's Temperance Hotel in Lonsdale-street, from designs by Messrs. Crouch & Wilson.

Churches.—Mr. C. Webb has been engaged some time in adding transepts to St. Luke's Episcopal Church, Emerald-hill. The Wesleyan body are pushing forward several new churches;—at Sandhurst, a stone church, which will cost upwards of 2,000*l.*, from designs by Mr. Doane, of Ballarat: the style adopted is the Early Period Gothic;—also at Campbell's Creek, to cost 1,318*l.*; and Donnolly, to cost 668*l.* Both these latter are from designs by Messrs. Crouch & Wilson, and are after the latter part of the Early Gothic period.

Melbourne.

INFRINGEMENT OF BUILDING ACT.—We have received a letter, signed "George Adamson," denying that he is the builder of the houses in Wandsworth-road referred to in our last Number (p. 141); but as we simply reported statements made before the magistrate by the district surveyor, we must refer the writer to that gentleman.

GOOD COOKERY AND BAD COOKERY FOR THE MULTITUDE.

THE unsatisfactory and wasteful system of cooking, or rather want of system, which prevails amongst the industrious and poorer classes of this country, is an old subject of complaint with us. In the ill-constructed houses in which thousands of the working population of the metropolis live, the waste in cooking is enormous; and this is caused partly by the unsuitable formation of the fire-places, and want of knowing how to manage plain, wholesome, and economical cookery.

The practice of filling with several families a house which was intended for only one, prevents the possibility of any proper arrangement for cooking in the kitchens of those houses. There is ample provision for preparing a dinner: there are boilers and ovens which are of daily use to a family, but unfortunately this accommodation is only available for the use of one tenant, the remainder of the persons living in the house being obliged to manage as well as they can with fire-places which have been intended to warm parlours, bed-rooms, or drawing-rooms.

We have made a careful sketch in one of such rooms, the truth of which will be recognized by thousands of well-paid artisans and other workers in the metropolis. The fire grate is not more than 10½ inches in width, and in height 7½ inches. In this instance—and it is one of a multitude—there were not more than 3 inches or 4 inches of space on each hob. In order to get the vegetables ready, it is necessary to place the pan in such a position that it covers nearly the whole of the top part of the fire, and this prevents the roasting of the meat, and generally leads the smoke to fill the apartment and cover everything in it with flakes of soot. There is barely room for one pan on the fire at a time; and if potatoes and cabbages are to be made ready for the Sunday's dinner, they must be boiled one after the other, and one vegetable is sure to be spoilt by being kept waiting. Few joints of butcher's meat can be found to fit those wretched cooking-grates. A neck or breast of mutton is far too long and only part of it is touched by the fire at one time; and other joints are equally difficult to manage. It is not to be wondered at, under such circumstances, that the temper of housewives becomes ruffled, and that husbands are glad to get out of the way until dinner-time. Even then matters are not satisfactory: for in nine cases out of ten the food, when put upon the table, is neither pleasant to the sight nor cooked with advantage. Even in connexion with fire-places of this description good dinners for small families might be cooked with the help of a "Dutch oven," and other contrivances of a similar kind; but these appliances are used by few.

When all this muddle, confusion, smoke, waste,

COOKING AND WASTING.

and ill-temper are caused by cooking in a room of this kind, it is not to be wondered at that the bakehouse is extensively patronized on Sundays. Into the public ovens go all kinds of meat; pork, beef, mutton, geese, and other matters; and it is certain that by this process a large amount of the nutritious qualities of the food is wasted, while the flavour of the varieties of butcher's meat must be assimilated.

In various ways the science of cookery has made advances: in workhouses, prisons, and hospitals, the saving which has been effected by improved apparatus, and by the preparation of food on a proper plan and on a wholesale scale, is enormous. The cost per head at which persons can be properly maintained is thus considerably diminished. The articles are obtained from the cheapest and best markets, and everything is put to its proper use with the least waste. In the army, Captain Grant's apparatus, and that of Messrs. Benham & Son, are doing wonders: besides the large sums which they are the means of saving, in consequence of the soldiers being enabled to obtain a variety of well-cooked food, such improvements tend to improve health and lengthen life.

In the royal kitchens at Windsor and Buckingham Palace, in the kitchens of the great West-end club-houses, and in the large mansions of many individuals, a good description of cooking apparatus has been introduced, and due regard is paid to economy in the nutritious qualities of the various descriptions of food.

In some important families, and in some hotels, the waste of food after it has been dismissed from table is shameful. Good provision, which would gladden the hearts of hundreds of poor persons, and which could in many ways be made most useful, is thrown into tubs and sold with "pig-wash." A perquisite by this means falls to the share of certain of the servants. Those who know the terrible poverty which prevails in Bethnal-green, Spitalfields, and other parts of the metropolis, cannot but regard this waste as a sin, and would urge, although it may not be in accordance with modern custom, that masters and mistresses should themselves look into this matter.

In some of the public schools a reform of this system of cooking is much required: take, for instance, the Blue Coat School, where, for the most part, the meat is baked, and there is but little variety in the food. On ship board—particularly in the Royal Navy—there is also room for improvement in this respect. When a ship is at sea, the choice of provisions is by force chiefly confined to salt meats; but in port there is no necessity for this. In several of the old-fashioned taverns in the City the plan of cooking is antiquated and expensive, and there are but few places in which a working man can obtain a good dinner at a cost which he can afford to pay: the consequence is that he is generally obliged to take

each day a bundle of provisions that have been cooked at home in the manner to which we have referred, and at dinner-time go to the ill-ventilated tap-room of a public-house, where he must, of course, spend a certain amount on beer for very indifferent accommodation.

Look in what direction you may throughout the metropolis,—and the same may be said of the chief of our large provincial towns,—you will find no adequate provision made for well and cheaply feeding a vast portion of the community. And in London especially there is but little opportunity for properly preparing food at home.

The advantage of cooking with the aid of proper apparatus, on a large scale, has been proved in various ways besides those to which we have referred. In Lancashire, during the prevalence of the present distress, many useful lessons have been learned, and persons have been surprised at the large number who can be fed, by proper management, for a comparatively small sum of money. In Glasgow, as we have already mentioned, a movement has been made, which we look to see followed in the metropolis and elsewhere. Already the matter has been taken up in Manchester; and so far as experiments have been made, the fact seems to be established that self-supporting cooking depôts, on a handsome scale, can be established for the use of the working classes.

More important, however, than this it is that knowledge on the subject of cooking should become general, and that the means of cooking properly, and with the greatest effect at the least cost, should be brought within reach of larger numbers than is now the case. We have no wish to see the family circle broken up, or any place made more attractive to an Englishman than his own fireside.

RECENT ARCHITECTURE IN BIRMINGHAM.

A CRITIC of the art wishing to arrive at some definite conclusion respecting the recent progress of our architecture could not do better than pass a few days in the examination of the new buildings of some large and influential country town. The metropolis forms too vast an area for a rapid critical survey. Remarkable edifices of recent erection are too far asunder for ready and immediate comparison; and the metropolitan works, except as to scale, do not always form the best or most important samples of modern architectural art.

It was with these convictions that the writer thoroughly enjoyed a recent stroll through the streets of Birmingham, in many of which new buildings of imposing dimensions have recently sprung up in the form of merchants' warehouses, extensive manufactories, stacks of buildings affording shop-frontage below and exhibiting architecture of palatial magnificence above, which, with a goodly number of new churches, new schoolhouses, and buildings of various other kinds, form in the aggregate as good a field of observation as could be devised for the modern architectural critic.

The somewhat older buildings of the town that were thought to exhibit such signs of architectural advance some score or ten years ago, now serve only as marks to indicate the progress which was then beginning, and which has now left those works far behind in the general artistic improvement of the country at large which has since been taking place. There is the façade of the Free Grammar School, for instance, one of the early (though not among the earliest) modern Gothic designs of Sir Charles Barry. There is a poverty about it that, to the artistic eye instructed by twenty years or more of subsequent advance in the art, is unsatisfactory; and yet it must be conceded that it was one of the best works of its day, and that Sir Charles Barry was one of the chief founders of the present school of modern Gothic art. Then there is the restoration of St. Martin's spire, at the bottom of the Bull Ring, the work of another eminent London architect, and of much more recent date than the Free Grammar School, but which yet presents similar defects of treatment.

It is sometimes urged that if reproduction be *accurate*, the effect of the new work must be *identical* with that of the old. But this is not necessarily the case. For instance: we will suppose that a modern Italian artist has produced a copy of Raffaelle's Transfiguration. A critic pronounces it inferior to the original. The artist calls for compasses; measures the eyes and noses of his own work, and compares their relative dimensions with those of the original picture: they agree to a hair's breadth. The blue, red, or grey draperies are of precisely the same intensity—even the folds identical. Not a feature—not a detail, can be proved to be mechanically different. The modern artist is, perhaps, satisfied that such tests prove the equality of his pencil to that of Raffaelle. But yet the critic is not convinced, however conclusive the tests applied may appear to the copyist. It is true that there is not a strict analogy between a picture and a building, but such as there is, is amply sufficient for the purpose.

The Town Hall, a building in the modern Classical style, belongs to a period now more than twenty years past, and but for its noble dimensions and noble simplicity, it might be as severely criticised for being below its classical models, as the Gothic buildings referred to are below their Gothic ones. The grand and truly monumental scale of this building, however, notwithstanding its many shortcomings, renders it still the most important in the town. But many recent works of far inferior scale and pretension, abundantly prove that, should the occasion offer, more than one Birmingham architect might be found to endow the town with a finer building than the Town Hall.

Among the new churches two especially are worthy of a much more detailed character than can be allotted to them in the brief space of the present article, namely, the Wickliffe Chapel in the Bristol-road, built for a Baptist congregation by Mr. Cranston; and the new Unitarian Church in Broad-street, designed by Mr. Bateman. The Wickliffe Chapel, taken as a whole, possesses, as one of its especial distinctions, that stamp of solidity and completeness which invariably distinguishes good ancient examples, which is so seldom found in modern reproductions of the Gothic style. There is a quaint feeling, amounting almost to originality, about the design of the windows; and also in the delicate and graceful, but sparingly introduced ornaments. The interior of this church is very elegant. It has also the merit, considering the material, to have cost no more than 7,000*l*.

The new Unitarian church, built from designs by Mr. Bateman, has one ingenious peculiarity about it which must not be passed over in silence. This consists in the unusual nature of its foundations. When it was determined to build a new church for the Unitarian congregation, instead of the one in the centre of Birmingham, it was thought that Broad-street, which unites the fashionable suburb of Edgbaston with the main town, was the most eligible situation. But after every attempt to procure a site, it was found at last that none could be found at anything like a reasonable amount of cost along the whole length of that important line of road. It was, however, suggested that, at the point where the bridge over the canal occurs, an adjoining bridge, or archway, might be erected, sufficiently strong to carry the entire structure. This project was found to be workable, and was promptly carried into effect; and when the high parapet wall of the old bridge was removed, and the façade of the church was found running parallel with the existing footway, no one would have guessed that the new edifice was built over the canal, especially as the wall on the opposite side of the roadway is so high as to keep the water quite out of sight. This is probably the only example of a highly decorative church capable of holding something like a thousand people being artificially supported at a considerable height above a line of busy water traffic that passes beneath its whole length. It is true that the bridges of the Middle Ages, when few existed, and the number of passengers crossing them was proportionately large, offered such great temptations to build shops upon them as was almost irresistible; and we know, in fact, that the temptation was not resisted, as proved by the Rialto at Venice, the old bridge at Florence, still gay with its jewellers' shops, our own old London Bridge before the fire, and many others. In such cases, too, we also know that a small chapel often occupied the centre; but the erection of a large church capable of containing a congregation of something approaching to a thousand people in such a situation, cannot, I think, be cited. The Unitarian church extends, supported on its own archway, parallel with the whole northern side of the old bridge, at some little distance from the footway, and is, beyond comparison, the most remarkable structure in the entire line of Broad-street to its termination at the Five Ways. The steeple is elegant, and stands to the right of the doorway.

The doorway is formed of a recessed porch, approached beneath three highly enriched arches, supported by double columns of polished red granite, the colour of which is richly brought out by the deep shade of the porch behind. The arches support three Decorative gables, each terminating in a finial, and united by a sort of connecting parapet, after the manner of many French examples of various periods; the whole surface of the parapet being enriched with diaper work of quatrefoils. The effect of this entrance is, however, somewhat marred, and rendered inconsistent by the coarse rustication of the whole surface of the adjoining walls. The contrast becomes too harsh, between utter rudeness and almost overwrought ornamentation. The window tracery of this building is quaint and pleasing, but the manner in which the blank space beneath the rather broad windows is filled up by a little parasitic buttress cannot be defended. If in consequence of some peculiarity of structure which cannot be externally traced, some additional strength became necessary at these points, it should have been applied in some (seemingly) less objectionable manner. We admired a stack of buildings by Mr. Gibson, in Bennett's-hill, but have not space to describe it.

Some of the most noticeable among recent examples of street architecture in Birmingham (though not always the most praiseworthy) are those which aim at producing their chief effect by means of different coloured bricks—red, black, cream-colour, and brown, being the colours employed; and larger bricks being used in arch work and the structural positions of importance.

Returning from our visit to the Unitarian Church, we passed the first favourable specimen of this style which came under our notice. At the corner of Bishopsgate-street, a small front garden has been built over, in order to turn to account, in the form of a grocer's shop, a valuable and conspicuous corner. The new shop, like some of those built over the gardens in the Marylebone-road, has nothing above it; and its façade terminates above the windows in a border of low Gothic gallery work. The style of the composition may be termed, to use a general term, Italian Gothic, and slightly calls to mind the famous Loggia by Orcagna, on the Piazza Vecchia at Florence, and the porch of a Venetian church which we well recollect; but the conspicuous use of bricks of different colours more strongly reminds one of those well-known edifices of the older parts of Genoa, which are composed from base to summit of alternate layers of black and white marble, marking the entire building with a series of horizontal stripes, which have a much more pleasing general effect than might be imagined. The windows of the structure under description are formed on each front by an arcade of semicircular arches, while the doorway at the angle is a Pointed arch of very sharp character, which produces a good effect, and one that seems perfectly natural. The structure of the arches consists, apparently, of properly-moulded pieces of terra-cotta, of large size, which are alternately deep brown and pale cream colour, the key-piece being brown. This archwork is strengthened in appearance by another arch, formed in small red bricks, immediately above it and adjoining it, the main surface of the wall beyond being of pale cream-coloured bricks of small size and beautiful manufacture. These arches are supported on slender Gothic columns of the same rich tone as the portions of brown in the arches themselves. They stand on a basement of cream-coloured brickwork, strengthened in effect (if we recollect rightly) by a strong line of graduated colour formed by a row of black bricks and row of red bricks joining each other, the black undermost. The effect of the whole composition is pleasing; and, were all the effects legitimately obtained, it would form a good example, on a small scale, of the artistic use of brick; for different-coloured columns of baked clay, and the use of differently-sized and differently-shaped bricks in various parts of the building may be considered quite a legitimate extension of the true domain of brickwork. But in the present example much "sham" supplies the place of what might easily have been the real thing represented. For instance, the large alternating masses of red and brown are not, as they appear, masses of baked clay, of alternately brown and cream colour, but merely painted stucco. Nor do they form the real structure of the arch, as they appear to do, but are merely outside show, the arch being built of ordinary brick cased in Roman cement, and then coloured in this deceptive fashion. The general effect produced by this design of Mr. Naden serves, however, to show what might be done by more legitimate means. This artificial colouring is produced by M. Sezerelmy's material, which, as readers of the *Builder* know, has been tried as a preservative on the stonework of the Houses of Parliament. It

will be well to watch its effect on the cement-work just described.

A much larger and altogether more important application of the coloured-brick style (concerning which architects are running wild) is exhibited in the stack of buildings recently erected after the design of Mr. Chamberlain (professor of architecture in Queen's College, Birmingham), at the corner of Union-passage, in Union-street. The general style upon which the main lines and features and the distribution of parts are based, is that of the Palatial Gothic of Venice. The materials employed, however, necessitate a sufficiently distinct kind of treatment, and the requirements of an extent of glass frontage in the basement have led to still wider departure from the principles of Venetian Gothic. The top line of the building is varied by the pointed gablets of a series of well-designed dormers. Below this pseudo-attic effect is a cornice, intermediate in style between Gothic and Classic, in the fascia of which is an inlay of a Vandyke pattern, formed of plain glazed tiles, of small size, fitted to the pattern, which only consists of three plain colours, green, red, and white. Below the cornice are the windows of the upper floor. They are formed by pointed arches, sparingly decorated and grouped in threes or fours, after the Venetian manner. Below these is a string course, the chief effect of which is produced by different-coloured bricks, the tones of which tell out well against the self colour of the general brickwork of the façade, and form a quaint and not unpleasant contrast with the plain stucco dressings of the columns and arches of the groups of windows. The windows of the principal floor are larger and richer in design, and the self-coloured arches of the cement dressing are made to blend in effect with the general brickwork, by means of a superadded arch formed of red and black bricks in alternate masses. The arches of the shop-windows of the basement, in order to obtain the largest possible quantity of light, are very flat ellipses of great span, squared at the springing in order to obtain a little angularity of effect in accordance with the Pointed character of the features above. These elliptic arches are probably artificial and exist merely on the surface, the real support for the superstructure being obtained by horizontal beams or brestsummers, as in ordinary shops when nearly the whole lower frontage of the building is required to be glass. The elliptic arches just described are enriched with encaustic tiles, and are supported on clusters of Gothic columns, which impart to the arches the appearance of really doing the duty which we presume they only pretend to do. The same architect designed the tower of the new waterworks, in which also effects of colour are obtained by means of varied bricks.

There is another specimen of party-coloured brickwork in Great Hampton-street, which is somewhat raw and course in its effect, but is yet bold and bright. It has, moreover, the additional advantage of being economical, the whole stack of building, comprising four or five shops, with fine lofty houses above, having cost no more than 2,500*l.* Mr. Bland was the architect. The pointed arches of the pseudo Lombardic-Gothic, which has been adopted as the basis of the style of this building, are rendered effective by means of their structure, with long and very narrow bricks, in groups of three or four, alternately black and cream colour.

Of buildings formed of a successful combination of brickwork of the usual kind, enriched with stone dressings, there are several recently erected which take fair rank. We may mention especially a stack of buildings in Bull-street, destined for retail shops, with living-rooms, or offices above. The brickwork of these buildings is deep red, in contrast with which the stone dressings produce a strong effect. The designs of the window dressings are carefully studied. The most notable and noteworthy characteristic of this piece of architectural design is the result of the determination which the architect has shown not to exhibit a massive superstructure apparently resting on the fragile support of a sheet of glass, as is so commonly the case in street architecture, where conveniences required by retail shops are the all-important feature to be studied by the architect. The windows themselves are so good that passengers must be attracted to stop and admire them, and they are very probably more advantageously influenced by the smaller, but, of course, more select display of goods in the narrower compass here afforded, than by the gaudy and profuse exhibition of less choice articles, which go to fill up the wide expanse of the usual wide-spread glass frontage. A similar stack of buildings, but of rather a distinct style of Gothic, has sprung up in Carrs-lane, after the designs of Mr. Charles Edge. The German Domestic Gothic, as exhibited in some of the fine old houses of Cologne and Augsburg, has probably furnished Mr. Edge with the basis of his style. The chief distinctive feature of this pile of building arises from the massive effect of the window dressings, the entire upper part of each pointed head of his window openings being formed of a single piece of stone, supported at the sides on the main walls, and in the centre by a slender column. The head of course forms a kind of stone lintel, and precludes the necessity of constructing an arch for the support of the wall above; but Mr. Edge has, nevertheless, surmounted the lintel with a superfluous arch, worked in bricks, alternately grey and white, which appears to unite the effect of the stone lintel with the general brickwork in a pleasing manner. The lower part of the stone lintel is cut up into the form of a double arch, enriched with good mouldings, the centre resting on the column which divides the window into two compartments. A great space of this stone lintel is, however, still left intact by the cut-up arches, and the broad plain expanse of the stone is only very sparingly ornamented by a small decorative circlet, and three delicate *fleurs de lis*, or as in the second tier of windows simply by the circlet, from which a small but well-carved head projects.

In the Italian palatial style of the Renaissance, Birmingham may boast of some good examples, both in stone and stucco. Mr. Thomason, a descendant of the well-remembered Birmingham celebrity, Sir Edward Thomason, was the first to erect a building of this kind in his native town. It was, indeed, the appearance of his works, which gave that impetus to the progress of architecture in Birmingham which is now exhibiting signs of development. Mr. Thomason's favourite features of the style appear to be, first and foremost, the great Farnesian cornice, which he has, however, almost always surmounted by an attic, varied in top line by dormers, which have sometimes a good effect. Secondly, his upper tier of windows, immediately below the cornice, is generally formed by a series of connected arcades, a portion of which are blanks, while others serve as frames for the lights of the upper rooms, the columns of these arcades being generally of polished granite. His principal tiers of windows are more or less in the usual style, and the basements are of course modified (more or less successfully) to meet the exigencies of shop-fronts, except in those more fortunate cases where they are not required. The richest example of Mr. Thomason's works in this style is perhaps the mass in Union-street, the cornice of which appears rather too heavy, in consequence of the return finishing too suddenly,—a common defect in the style when pressed into the service of close street architecture, in which the cornice only appears in the frontage, instead of forming a complete crown to the whole mass of the building, as it does in the case of the Farnese Palace, and nearly all the fine Italian examples of the style. This building is entirely cased in stucco, with small polished granite columns to the upper arcade of windows. The most monumental example of this style, as being entirely of stone, instead of imitative stucco, is the building now erecting by Mr. Plevins, for offices of the Birmingham and Staffordshire gasworks. This edifice stands in the old square, dwarfing in a remarkable manner all the houses around, which were once ranked among the most important in Birmingham. In the design of this building there are many details well worthy of description; but the general effect, and that which most satisfies the eye of an architect, is a stately simplicity of character, not very easy of attainment, which pervades the whole. Mr. Plevin is also the architect of the Quakers' Meeting-house.

Mr. Payne is another Birmingham architect who has adapted the Italian palatial style of the sixteenth century to the requirements of ordinary street architecture. The pile of buildings known as the Royal Chambers, which he has recently erected in Temple-row for Mr. Charles Couchman, may be pointed to. The windows of the principal floor show conscientious study. The design of this architect for the projected Birmingham Club, at the top of New Hall-street, is on a more extensive scale. The present position of the principal entrance is a defect which, it is to be hoped, may be got rid of.

Many other buildings recently added to the architecture of Birmingham might be noticed, but the extent of space already occupied prevents further extension of the subject just now.

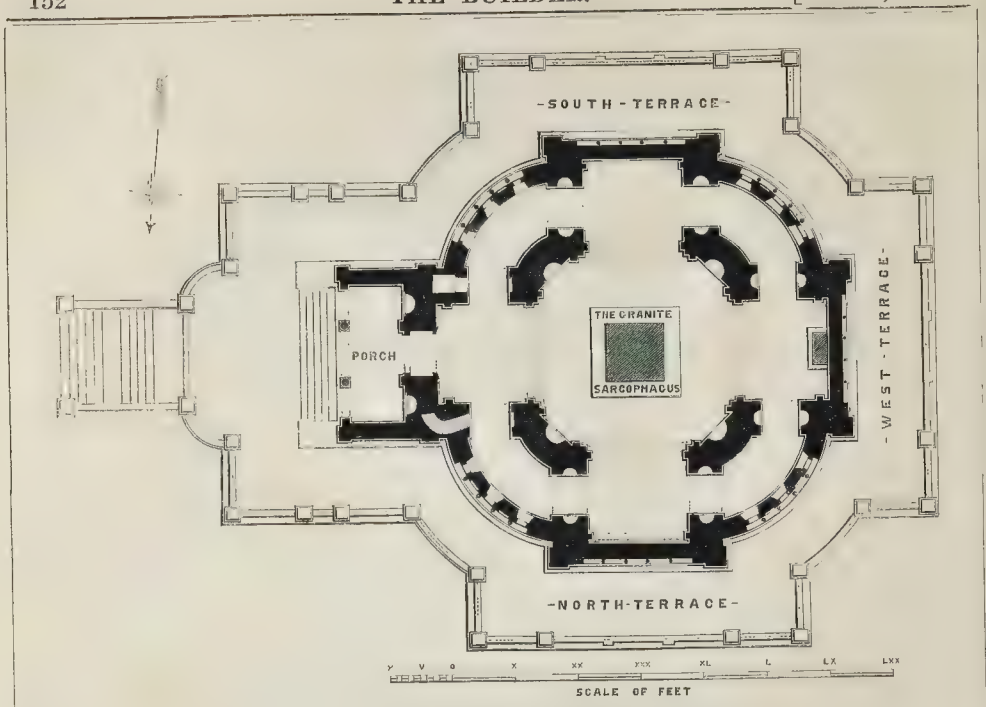
THE ALBERT MEMORIALS: ST. GEORGE'S CHAPEL, WINDSOR.

THE great east window in St. George's Chapel, with its newly-wrought stonework of fifteen lights in width, and four tiers in height, is being filled with stained glass by Messrs. Clayton & Bell, and will be dedicated in the following inscription to the memory of the late Prince Consort:—

"*In honorem Dei et in desideratissimi Principis memoriam, hanc fenestram Decanus et Canonici mœrentes posuerunt curaverunt MDCCCLXIII.*"

The subject-matter of the window comprises the incidents of the Birth (adoration of the Kings), Resurrection, and Glory of our Lord. To these are devoted the central positions on each tier; each subject occupying seven lights in width. In the side lights, four on each side of the window, are introduced, tier upon tier, the following selection of apostles, prophets, and worthies of the Old and New Testaments. *In the lower tier*, Asa, Jehosaphat, Hezekiah, Josiah, Nicodemus, Gamaliel, Timothy, The Good Centurion. *In the second tier*, Abraham, Joseph, Samuel, Daniel, St. John, St. James Minor, St. Bartholomew, St. Barnabas. *In the upper tiers* are introduced the twenty-four Elders casting down their Crowns before our Lord, the three Archangels, and various groups of angels, cherubims, &c. *At the base of the window*, and in immediate connexion with the inscription and the armorial bearings of the Prince, is a tier of fourteen small subjects representing an ideal princely figure—in which portraiture is avoided—engaged in various acts of public and domestic worth. The idea therein embodied is princely interest in Agriculture, Science, Learning, Art, &c. The series comprising the central division is devoted to scenes of private life. The window promises to be the best work of the artists.

The Wolsey Chapel adjoining St. George's is to be restored and decorated in a sumptuous manner in memory of the Prince at the cost of the Royal children. The artists already named are to design and prepare the cartoons for the elaborate decorations of its roof and numerous windows which are to be filled with stained glass. The roof decorations in mosaic work will be carried out in accordance with these designs by Dr. Salviati, of Venice. The works are to be spread over a considerable period of time, and will cost, perhaps, 25,000*l.*, although the edifice is very small.



Wolverhampton.—Photographs have been prepared of the model of the intended military equestrian statue of the Prince for Wolverhampton, which is to be erected on the pedestal now surmounted by the Russian cannon in High Green. Mr. Thorneycroft, the sculptor, has been intrusted with the work. This gentleman, after he had been instructed by the committee, informed the Queen of the nature of the commission, and her Majesty was pleased to express her gratification. The estimated cost, including the alteration of the present pedestal, will be 1,200*l.*, of which sum 400*l.* yet remain to be subscribed.

Newport.—A simple monumental tablet to the memory of His Royal Highness, and executed by the Baron Marochetti, has just been erected by public subscription in St. Thomas's Church, Newport, Isle of Wight, between the two stained-glass windows presented by her Majesty and the Prince. It occupies but a very little space, and consists of a white marble bust of the latter *in relievo*, on a crimson ground, surrounded by a framework in black marble, with a carving of laurel-leaves around it. A gilded German crown surmounts the whole, and his official bâton of office lies in front. Beneath appears, in letters of gold, the single word "Albert," an enlarged autograph of his usual signature. The cost is said to be 200*l.*

MANCHESTER ALBERT MEMORIAL.

THE question of a site for the Albert Memorial (which, it will be recollected, consists of a marble statue by Mr. Noble, presented to the city by the late mayor, Mr. Goadsby; and an ornamental stone structure, designed by Mr. Thos. Worthington, architect, to inclose the same, the cost of which is defrayed by public subscription) seems to have received a satisfactory solution, as briefly stated last week.

It had been proposed that the memorial should be placed in the Infirmary grounds, either immediately in front of the centre of the Infirmary, or at one side, near the Queen's Hotel, in Port-

THE ROYAL MAUSOLEUM, FROGMORE. — *Plan.*

land-street; but it appears that the trustees of the Infirmary were not able to give a title to the Memorial Committee to place the statue within the grounds unless pecuniary compensation were given. As the Manchester Corporation did not feel themselves justified in undertaking the responsibility of this compensation (which, we are informed, was equal to an annual rental of 100*l.*), it has been proposed by the Improvement Committee of the Corporation that the memorial be placed on the space in Bancroft-street. The Memorial Committee have accepted this offer of the Corporation, on the condition that the proposed square to be formed in Bancroft-street be kept permanently an open space. It is proposed to obtain Parliamentary powers to remove the block of building known as the Engravers' Arms, so that a square would then be formed 95 yards by 69 yards, in the centre of which the memorial would be placed. The advantages of the site now proposed, and which may be considered adopted, are stated by its advocates to be,—that it is central, being within a few minutes' walk of the Exchange; that the square will be so spacious that excellent views will be obtained on all sides of the memorial; that it will be approached by a number of excellent streets; that one side of the new square will be bounded by land belonging to the City Corporation, which may at a future time be used as a site for the erection of a new city hall, or other large public building, in front of which the ornamental memorial will be most appropriate; and that the formation of the square will afford another central breathing lung for fresh air to the city.

The Manchester Albert Memorial will be found fully illustrated and described at pages 804 and 805 in the last volume of the *Builder*, to which we refer our readers.

THE PROCESSION THROUGH LONDON.

The carpenters and gas men are hard at work in London preparing seats to view the procession of the Prince of Wales and the Princess Alexandra, from the Bricklayers' Arms Station towards the Great Western. The decorators' turn will come next. Under the direction of Mr. Bunning, a triumphal arch is being erected at the foot of London Bridge, and seats are being formed around St. Paul's and in front of the Mansion House. The decoration of Temple Bar is also in his hands. The construction in St. Paul's Church-yard is of great extent and corresponding strength. It is wholly roofed over, with a projecting roof in front, and will be fittingly adorned hereafter. Around the churches in the Strand also, and in every other available position, seats are being erected.

In Southwark, too, justly jealous of its ancient rights and duties as a borough, triumphal arches will be raised and suitable decorations provided.

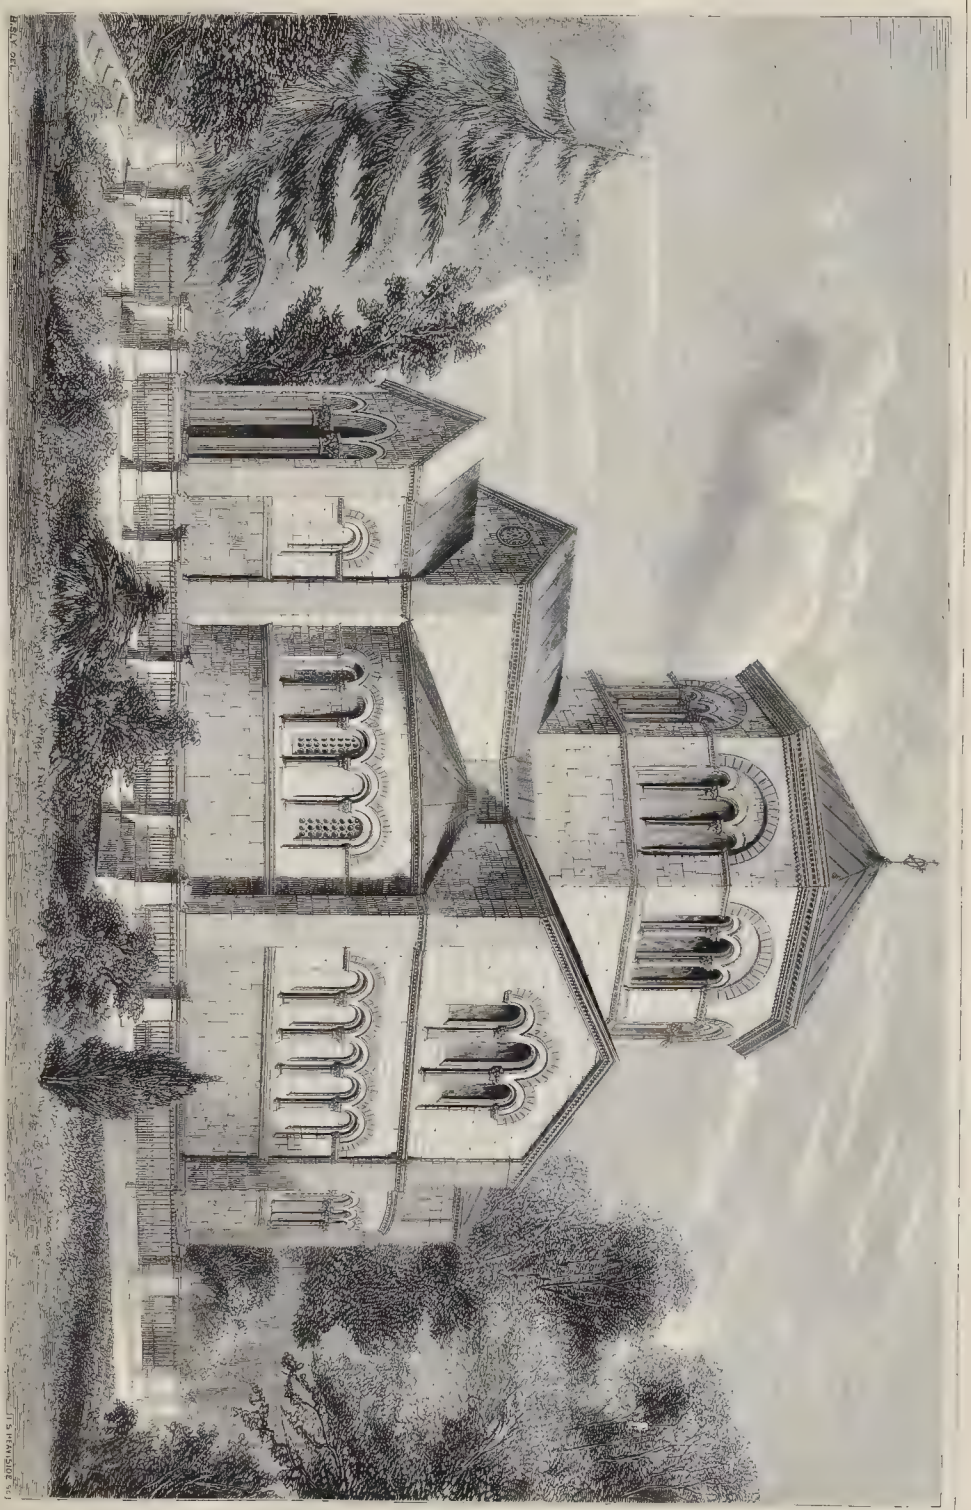
As to the illuminations, some experiments have been made in Edinburgh with the view of marking out the architectural lines of buildings, and should be inquired into by those concerned with our public buildings here.

One correspondent suggests that every householder should light up the *interior* of his rooms, keeping the blinds up; and another that the dome of St. Paul's should be illuminated.

THICK AND THIN BEDS AND JOINTS IN BRICKWORK AND IN MASONRY.

The use of thin or of thick beds of mortar, in brickwork and in masonry, must, in a great measure, be governed by the character of the work and the quality of the materials. Marble, if moulded, carved, and even if plain, but polished, must have fine beds and joints. Ashlar masonry, as in the New Houses of Parliament; in the Reform Club, Pall-mall; in St. George's Hall, Liverpool; and, in all masonry of this class, must have thin beds and joints. The best class of brickwork and terra cotta work, plain or enriched and moulded, must also have thin beds and joints. As a general rule, it may be stated that buildings, whether of marble, of limestone, of sandstone, or of brickwork alone; or of brick and terra cotta combined; which are ornamental in character; enriched by carving and mouldings, or plain on surface, but polished or tooled, must all have thin beds and joints. Thick beds and joints of mortar would destroy the harmony of design, by deteriorating the appearance of labour bestowed on the marble, stone, or brick and terra cotta, in such buildings.

The Romans used "tiles." That is, Roman bricks are (many of them) square, like tiles, say 6 inches by 6 inches, or 9 inches by 9 inches, or 12 inches by 12 inches, and 1 inch, 1½ inch, or 2 inches thick. In many Roman buildings now existing such bricks or tiles may be seen, set in beds of mortar almost of equal thicknesses to the tiles. In the East generally (Constantinople), as also in Spain and in Italy, this class of work exists; in ancient buildings as likewise in those most modern. Tanks, towers, minarets, domes, arches, and walls, may be examined, in which bricks and mortar have almost equal proportions. Where the mortar is good, such buildings are sound after centuries of wear, neither the action of the elements nor the violence of man having wholly destroyed them.



In modern practice, in all masonry and brickwork, where strength is required rather than ornament, thick beds and joints, of good mortar, will be useful. Thin bricks or tiles will also be better than thick bricks, as the material will be better burned, and consequently more enduring: more mortar can also be used, which in such work gives strength.

Mortar may be used safely, and even with advantage, in thick beds and joints in masonry, for docks, for railway-bridges, viaducts, and retaining-walls; as also for warehouses, goods stations, cotton-mills, tall chimneys, fence-walls, and all similar structures. Reservoir-walls, tank-walls, and covering arches for waterworks, ought most certainly to have thick beds of good mortar.

The proportion of mortar to rubble-stonework, should be about 1 to 3, that is, in 4 cubic yards of rubble-wall there should not be less than 1 cubic yard of mortar. In brickwork (ordinary bricks), the proportions will be 1 to 4. If thin bricks are used, or if very small stone is used for rubble-work, the proportions may be as 1 to 1, like some of the work to be found at this day in Italy and in the East, which ancient work is sound after centuries of time; and all the destructive agencies of the elements, of man, and even earthquakes, have failed to destroy such work in many instances.

Much may be said as to the disadvantage and danger of building hybrid work;—that is, injudicious mixtures of ashlar, rubble, brickwork, and concrete. But a treatise would be required, illustrated by many diagrams, fully to detail all that may be said on this most important part of masonry.

Robert Rawlinson, C.E.

THE ROYAL MAUSOLEUM, FROGMORE.—DESIGNED BY PROFESSOR L. GRUNER AND MR. A. J. HUMBERT, ARCHITECT.*

[* See p. 145, ante.

FRANCE AND BELGIUM.

THE Bank of France has just obtained from the town of Paris authority to dispose of all the site occupied at present by the Rue Baillif, containing more than 200 mètres, to construct necessary annexes for the service of that institution. An engagement is also entered into by which the bank authorities are to construct houses bordering the new street, which is to be 20 mètres wide, to replace the Rue Baillif, and place the Rue Croix des Petits-Champs in direct communication with the bank.

In examining the works of the Pont de Charenton, which we had not visited for several months, we remark that they have been vigorously carried on last season, the masonry being nearly up to the level of the roadway.

By means of a small tramway, worked by a locomotive and two iron cranes, heavy blocks are lifted out of the waggons and deposited with the greatest ease in their proper places.

This bridge, which crosses both the Marne and the Canal joining the Seine with the Rhine, consists of four arches, three for the river and one for the canal. The span of the latter is considerably greater than that of the others, and the design is one of surprising boldness. The species of promontory separating, below the old bridge, the principal branch of the Marne from the smaller arm (now canalized), has been lowered at its extremity, and serves as a base for the first right-hand pier of the new bridge. This tongue of land will be levelled evenly as far as the bridge which carries the Lyons line; and will form, throughout its length, a mole or jetty similar to that separating the Seine from the canal near the Monnaie Lock.

The reconstruction of the Pont de Charenton is one of the principal enterprises of this class undertaken in 1862. The other analogous works are the enlarging of the Pont du Saint-Esprit, over the Rhone; the construction of the Pont de Belle Croix and the Pont de Perinel, over the Loire at Nantes; and the Pont de l'Albi, over the Tarn.

In the department of Somme, the Minister of Public Works has authorized surveys to be made for a railway from Achiet to Ham, by Bapaume and Péronne. This branch line, intended to unite that from Arras to Hazebrouck, Calais, and Dunkirk, with the Chemin de Fer de l'Est, traversing a fertile and industrious country, will be of considerable interest, both as regards the international traffic and the development of the coal-fields of the Pas de Calais.

It is worthy of note that about the middle of December, 1862, gas made its appearance in the steeple of Saint Malo, at the greatest height to which that mode of illumination has been practically adapted in France to a building. It illuminates brilliantly the four dials of the Cathedral tower, which stands at a considerable elevation far above the town and roadstead, constituting a prominent object from the sea and roadstead.

The inhabitants of Brussels, justly proud of their fine promenade, *l'allée verte*, have lately been in great trouble about its being ruined by the passage of a branch railway through the middle of it. This celebrated promenade was even held sacred during the memorable siege, when deputations of ladies invoked the protection of the Maréchal de Villars to save their favourite pleasure-ground. It was on this occasion that Louis XV. decorated Mannekin with his order, and he was presented with a complete costume, still preserved as a relic. Owing to the numerous protestations against the encroachments of the railway, and the strenuous efforts made by persons of the highest influence to prevent this act of Vandalism, as the Brussels ladies called it, the several projects before which the promenade was to be sacrificed have been abandoned.

The works of the railway from Brussels to Louvain have been contracted for by M. Detiège, and are to be commenced forthwith. The project will be completed in two years hence.

The college of the burgomaster and councillors of the town of Brussels have issued printed instructions to prevent accidents that may arise from the use of mineral oils for the purposes of illumination.

The show of cattle, generally held at Brussels the Monday before Easter, will take place on the 20th March, at the Abattoir.

SOCIETY OF ENGINEERS, EXETER HALL.—The paper to be read on Monday, March 2nd, is "On the Relation between the Safe Load and the Ultimate Strength of Iron," by Mr. Zerah Colburn.

STATISTICS OF COMPETITIONS.

THE accompanying table of statistics has been prepared in order to test, as far as possible, the effect of the present system of competition upon the members of the architectural profession.

The years 1859 and 1860 are omitted, in consequence of imperfect information.

It cannot be denied that competitions now and then assist some few unusually fortunate men; but it is evident that every one of these acts prejudiciously to the interests of other members of the profession, since the outlay incurred by unsuccessful competitors is enormous; and their drawings, when returned, are worth little more than waste paper.

An individual chance in a competition is this:—

It is 20 to 1 against winning	first premium,	51*l.*	av. value.
10 to 1	,, second do	20*l.*	,,
20 to 1	,, commission	323*l.*	,,

To enter the lists, therefore, with a fair chance of success, we must be prepared to send in for twenty competitions: these will cost in cash 300*l.*, a sum nearly equal to the greatest amount we can calculate on obtaining in return. This is, indeed, a favourable view of the case, for in more than half the instances before us no hope was held out that the successful architect would superintend the work, so that perhaps 30 to 1 against obtaining the commission would be nearer the mark.

At present the members of the profession spend nearly the amount of the commission on every competition, so that the public gain the full amount of our services for nothing; and as a rule (although some few gain), the competitors sustain serious losses.

AUGUSTUS FREER, Architect.

An average receipt of £122, instead of average value of commission, £323 each.

BUILDERS' BENEVOLENT INSTITUTION.

WE saw with very great pleasure that the recent ball in aid of the Builders' Benevolent Institution was well attended, the rooms being more crowded than on previous occasions. Between five and six hundred assembled together, not only to enjoy a pleasant evening, but to increase the funds of one of our most deserving charities. The Right Hon. the Lord Mayor and the Lady Mayoress, with the Sheriffs, as also Mr. Henry Lee, the president of the Institution, and many of the leading builders of the metropolis, were present on this occasion, with the junior branches of their families.

The hon. secretary and the stewards deserve great credit for the arrangements made by them for the comfort of the assembled guests. The dancing was kept up to a late hour, and everything went off satisfactorily. We hope the funds will receive a large increase, so as to enable the directors to add to their number of pensioners in May next.

THE ARCHITECTURAL ASSOCIATION.

THE usual meeting of members was held on Friday evening (the 20th inst.), at the House, in Conduit-street; the president, Mr. Blashill, in the chair.

A letter was read from the secretary of the Nottinghamshire Architectural Association (Mr. Frederick Jackson), inclosing a copy of the following resolution, agreed to by that body:—

"That the Association, while fully appreciating the exertions of the Institute in the preparation of the valuable scheme of examination for the architectural profession, now submitted for their consideration, deems it due to the large body of architects of experience already in practice, and who cannot be expected to devote the time necessary to an examination, that they should receive from the Institute such a distinct recognition of proficiency, by diploma or otherwise, as will place them in a position not inferior to that of the younger practitioners, who may present themselves for the honours of the Institute."

The following gentlemen were on ballot elected members of the Association:—Mr. C. A. Long, 98, Bishopsgate-street; Mr. W. Roberts, 25, Parliament-street; Mr. H. M. Dunphy, 3, Dr. Johnson's-buildings, Temple; and Mr. Gassling, 4, Upper Gower-street.

Mr. E. L. Paraire moved a resolution to the effect—

"That the members of the Architectural Association suggest that copies of the report upon professional practice and architects' charges, bearing some distinct mark of the Royal Institute of British Architects, should be given to all applicants applying for the same."

He observed that the motion which he had ventured to propose was one in which he was sure they would all concur. He then called attention to the position held by the members of the Architectural Association, who, as students, were not supposed to know with any certainty what were the different matters an architect could legitimately undertake, nor were they competent to form any idea of the charges to be made. But here was the result arrived at by the senior members of the profession, offered them as their guide. Here they would find what they had to learn to enable them to practise, and they would also see what were the charges usual and recognized for such work. He was of opinion—now that the examination was no longer an idea, but an accomplished fact, and that candidates had passed through the ordeal, and had been found sufficiently well informed,—that these gentlemen, having gone so far, were, to an extent, entitled to ask for some guide, some tangible and acknowledged standard, towards which to direct their efforts; and that the document he then held was the very thing they needed. Mr. Paraire then called attention to the established architects, who, from pressure of business and

from other causes, had not time to prepare for or pass the examination. He alluded to legitimate architects; and he thought that they should have their practice clearly defined; and he asked who were the persons to accomplish this desideratum, unless it were the elder members of the profession, who not only could claim experience, but who, incorporated as a chartered body acknowledged and recognized by the public, had, after considerable trouble, framed the rules to which he was now calling their attention. He contended that the document issued by the Institute should be legalized by that corporation by affixing their common seal, or by the signature of the president, or by some other distinguishing mark, and be given to all legitimate architects applying for the same.

The motion was seconded by Mr. North.

Mr. T. R. Smith said he could not quite agree in all Mr. Paraire had said. He thought that it would be a matter of great difficulty to know who were the qualified persons to whom such a document should be given. Moreover, in case of dispute, the document issued by the Institute would not be received as evidence in a court of justice.

Mr. Harris said he thought the Association were exceeding their position in offering any opinion, and he should vote against the motion.

Mr. R. P. Spiers objected to the resolution as unnecessary. It seemed to him that, as it would do neither good nor harm, it would be a wise course not to pass it.

Mr. Fowler said that the question of who was entitled to be called an architect might be very easily solved. If a practitioner were a member of the Institute, or of the Architectural Association, he could no doubt support his charges, if necessary, in a court of law. He thought the Association was indebted to Mr. Paraire for having brought the subject under notice, and he quite agreed with that gentleman that it would be desirable that the seal of the Institute or the signature of its president should be attached to the rules and regulations issued and approved by the Institute.

The President said he doubted whether the rules and regulations could be received in evidence in a court of law.

Mr. T. R. Smith said it would be necessary to call a witness.

Mr. H. A. Reeves was of opinion that the Institute would not be indisposed to consider any suggestion that the Association might offer with reference to giving more direct official recognition to the rules and regulations; and reminded the meeting that in the case of architectural examinations, the Institute had ultimately adopted the views of the Association

Mr. Paraire, in reply, observed that the question for consideration was, not the difficulties that might arise, but the principle involved. If the principle was good, there could be no harm in saying so, and telling their seniors what were their opinions; but if every individual opinion was to be canvassed and discussed before agreeing on the principle, they would never arrive at a conclusion. The whole matter was simple, and resolved itself into the advisability of having some standard towards which they, as students, should steer their course.

A division was then taken, when the President declared the resolution to be negatived by a majority of one.

The President then brought under notice a subject which, he said, had been discussed by a sub-committee, which had been sitting on the affairs of the Association; namely, the advisability of forming a class with reference to architectural examination.

Mr. Spiers approved of the suggestion, and observed that the statement made in the *Builder*, that five of the gentlemen who had passed the recent examination, were members of the Association, was a very gratifying circumstance. He was not clear as to how the proposition could be carried out, as there might be some difficulty in obtaining persons to superintend the classes; but he was persuaded that the suggestion was a good one; and he hoped that the importance of out-of-door sketching in the summer would not be lost sight of.

On the motion of Mr. Harris, the further consideration of the subject was referred to the sub-committee now sitting.

Mr. G. B. New then read a paper "On Ventilation," illustrating his remarks by diagrams and models.

Mr. Battey subsequently explained his principle of natural ventilation in connexion with grates, which he urged provided an efficient and economical mode of ventilation applicable to private dwellings, hospitals, and all kinds of public buildings.

Mr. E. C. Robins also drew attention to Mr. Boyd's inventions and others, which he said were extremely useful, if architects could be prevailed upon to adopt them.

Some discussion ensued, after which a vote of thanks was awarded to Mr. New for his paper.

THE ARCHITECTURAL ASSOCIATION AND THE VOLUNTARY EXAMINATION.

OBSERVING the letter of "R. M." in your number of the 21st inst., which denies the assertion made by "T. R. S." that the Architectural Association has materially aided those of its members who have recently passed the voluntary examination; we, who are of that number, cannot refrain from bearing our testimony to the advantages we have derived both from the Class of Design and the ordinary meetings of the Association; and we feel it the more necessary to do so as the general tenor of the letter seems to suggest a desire on the part of the writer to depreciate the Association, which we cannot believe he entertains.

The argument used is of the weakest description; for while it is incidentally allowed that drawing and design are encouraged (to which, by the way, a quarter of the whole number of marks and one third of the time are devoted), an endeavour is made to show that the Association teaches nothing by pointing out those subjects which are more rarely brought before it, though no regular attendant would dare to say that they are never treated of. Questions in construction frequently occupy the Class of Design, and much general information is obtainable from the papers read, which, though necessarily discursive, are eminently calculated to lead to deeper study.

We cannot but feel that the remarks of your correspondent are extremely ill-timed, as he is aware that steps are being taken by the Association to form a class with the view of preparing students for the next and subsequent examinations.

(Signed) R. O HARRIS, LACY W. RIDGE, R. PHENÉ SPIERS, HENRY STONE.

CHURCH-BUILDING NEWS.

Wiggenhall, St. Germain's, Lynn.—Most of our ecclesiastical readers are acquainted with the four Wiggenhall Churches, each possessing interesting architectural remains, more especially the one to which our notice refers. This church, contains some very fine fifteenth-century bench-ends and seats. The whole fabric, which is a large one, having been allowed to fall into a very bad state of repair, is at last to be thoroughly repaired, and energetic means are now being used to collect the necessary funds for its restoration. The works had been placed in the hands of Mr. Withers, architect, who has prepared a report, accompanied by a set of drawings for a complete restoration. 2,500*l.* will be required to be expended, exclusive of all decorative art whatever.

Northill (Beds).—The restoration of the church of St. Mary, Northill, has just been completed. Exteriorly, the accumulated soil has been removed from the walls, drains made, the footpaths sunk to their proper level, the walls and battlements repaired and pointed, the stone-work of the windows cleaned and, where requisite, renewed, and the east gable crowned with a pierced stone cross. A dwarf spire of wood, covered with lead, has been taken off the tower, the decayed roof replaced by a new one, and the turret in the north-east angle inclosing the spiral staircase carried up some feet above the top of the tower, and finished with a parapet. The porch, with its groined roof, has been *decompoed* and restored, and also the south doorway of the church, which, as well as many other portions, says our authority, the *Bedford Times*, had been so "made up" with cement, that little of the original was left but disjointed fragments. Internally, the whitewash, which covered and disguised the walls, arches, and pillars alike, has been removed, and the arcade of sandstone stands out in its true colour and proportions, no longer obstructed by a ponderous gallery, which formerly cut in two one of the windows of the south aisle. The western arch, since the beginning of the century, had been blocked up by a thick wall, inserted with a view of lending support to the tower, which was in a defective state, and was at the same time braced up with iron stays. This wall has been now removed, and the arch, having been found much broken, reconstructed. The floor of the tower is thus opened to the nave, and the west window, with its tracery, displayed to view. The ringing-floor above has also been renewed. The whole of the nave is furnished with low oak benches, and paved with Staffordshire tiles in three colours. The inner parvise window, before blocked up, has been opened and glazed. The chancel arch it was also found necessary to take down and rebuild. The floor is laid with Minton's encaustic tiles in squares, those within the sanctuary being of richer design and colour, and arranged diamond-wise. The removal of a modern wainscot-screen from the east end disclosed the piscina and triple sedilia, which have been repaired. The east window, executed by John Oliver in 1664, has been cleaned and repaired, the upper compartments (previously glazed with common glass), filled with ecclesiastical emblems and devices by Willement, and the stone-work renewed. The other windows of the chancel have been filled with white cathedral glass in a green border. The chancel roof, entirely new, is divided internally into three bays by arched principals of oak cut from the solid tree, connected with the rafters by braces at the ridge and sides, and resting on corbels of sculptured angels bearing scrolls: the spandrils being filled with pierced tracery; the intervals between the purlins are also lined with oak. The rector has been assisted in this undertaking by a loan of 500*l.*, contracted by the parish, with subscriptions from the Harvey family and others; but a considerable proportion of the expense falls upon his own shoulders. The task of restoration was entrusted to Mr. Woodyer, of Guildford, whose designs and directions have been carried out by Mr. Conquest, of Kempston.

Halsted (Essex).—Bulmer Church, Halsted, has been restored and re-opened. Before the restoration the church was blocked up with high pews, a west gallery, and the chancel partly occupied by a large family pew, belonging to the Oakems estate. The pews (except the last-named one, which has been lowered), have all been removed, and open benches substituted: the gallery has also been removed, the tower opened, and the font placed there. The aisles and chancel have been paved with red and buff tiles, and the sacrarium or communion with rich encaustic tiles. The works are not yet completed, as sufficient money has not been subscribed, but decoration will be added when the funds are forthcoming.

South Collingham (Notts).—St. John the Baptist's Church, South Collingham, has been restored and re-opened. Both the chancel and the body of the church have been restored. In the chancel a new roof of polished pine has replaced the old one. All the stonework has been repaired and restored, and the windows re-glazed. A new floor of encaustic tiles has replaced one of stones and plaster—both in the chancel and nave. A recess, arched, has been built on the north side of the chancel for the organ. The organ has been enlarged and improved. All the old high pews have been removed both from the chancel and nave, and open benches substituted. The arches have been relieved of an accumulation of white-wash, and restored. The unsightly stove which used to obstruct the centre aisle has been removed, and the church is now heated by hot-air flues. The chief improvement is the removal of the gallery, which disfigured the west end of the building, and which, moreover, hid the arch at the entrance to the tower, and also the west window. Another improvement is the provision for exterior access to the ringing chamber. Mr. Hakewill was the architect employed. The tender of Mr. C. Fox, of Lincoln, was accepted; but in consequence of his being declared a bankrupt, the Building Committee took upon themselves the task of completing the work.

Southampton.—At a recent vestry meeting in St. Lawrence's Church, Mr. Beecheno, churchwarden, said he had received a letter from Mr. Frith, who offered to undertake the necessary work of repairing the top of the spire, regilding the vane, &c., for 30*l.*, including any extras that might be required. In a subsequent communication, he offered to execute the work described by Mr. Beecheno for 25*l.*, extras not included. It was agreed that the churchwardens be requested to collect the required amount in voluntary subscriptions, and to employ Mr. Frith to do the work on the last-mentioned terms.

Stone (Staffordshire).—The Roman Catholic church at Stone has been enlarged and re-opened. The church was commenced ten years ago, at which time the present nave and aisles were built. The additions were consecrated by Dr. Ullathorne, Roman Catholic Bishop of Birmingham. The external walls and buttresses are of Hollington stone, faced inside with stone of a much finer texture. The style of the church, which will accommodate about 700 people, is the second period of Pointed Gothic. It is divided into nave, side aisles, transepts, and chancel, with a nuns' choir to the north of the chancel, and a semi-circular apse containing the Lady altar to the south. In the north transept is a tribune for the *pensionnaires* of the school, and in the aisles are two small chapels enclosed in light open wood-work screens. That in the north aisle contains "the altar of the rosary," and that in the south, "the altar of St. Winifred and the martyr saints of Stone." A flight of seven steps leads from the nave to the

transepts, and the chancel is elevated three steps above the latter portion of the church. Of the whole number of windows ten are of stained glass. The principal of these are a rose window at the west end of the nave, and a five-light window with tracery at the back of the high altar, the latter the gift of Mr. John Fitzherbert, of Swynnerton. The roof is open, with stained panels, and gas is supplied to all parts of the building. The capitals of the columns from which the arches supporting the clerestory spring are finely carved, but it is in the chancel that the richest work is to be found. The high altar, in common with all the choicer parts of the building, is mainly composed of Caen stone, with columns and slab of polished marble. The frontal contains three pieces of carving—"The Sacrifice of Melchisedec," "The Sacrifice of Isaac," and "Elias fed in the Wilderness." The tabernacle is in polished alabaster marble, and the walls on either side of the altar are inlaid with diapered marble panels. At the back of the altar is a reredos, containing subjects from the life of St. Dominic, in high relief. On either side of the screen and in the centre are niches surmounted by canopies and pinnacles, of which the centre one is 25 feet high. The niche to the right of the altar is occupied by a life-size figure of Mary Magdalene, and that to the left by a corresponding figure of St. Catherine. The niches have pedestals, and the canopies columns of polished marble. In a recess in the nuns' choir, Messrs. Bevington & Son, of London, have erected an organ. The church was built by Messrs. J. & E. Bird, of Hammersmith, from the designs of Mr. Gilbert R. Blount, of London. The carving was executed by Mr. William Farmer, of London. The stained glass for the windows was supplied by Messrs. Hardiman, of Birmingham.

CONSECRATION OF ST. ALBAN'S, HOLBORN.

THE Bishop of London has consecrated this new church, which has been built and furnished at a cost of about 25,000*l.*, besides endowment, by Mr. John Gellibrand Hubbard, M.P. for Buckingham, and a director of the Bank of England. The building stands in a poor district, and is bounded on the east by Leather-lane, on the west by Gray's Inn-lane, on the north by Baldwin's-gardens, and on the south by Brook-street.

Lord Leigh gave a site at the end of Brook-street, and upon that the church stands, the parsonage being built on ground bought by Mr. Hubbard himself. Mr. Butterfield was the architect, and Messrs. Myers & Co. were the builders.

The whole buildings, outside and inside, are in the main of London ordinary bricks, relieved by stone, red and grey; the piers, arches, and windows of the church being of stone. There are a nave and aisles, chancel and aisles, and a porch at the west end, of unusually large dimensions, into which the principal doorways open. Over the chief door (in Baldwin's-gardens) is an inscription to the effect that the church is wholly free and unappropriated. The font, at the west end, is of Derbyshire marble, inlaid with white marble, and the shafts are of languedoc marble on a black base of Irish marble. The nave and aisles open from the font. The nave is 70 feet long and 32 feet wide, and measures 50 feet to the ridge. The aisles are 9 feet wide, and ornamented with an arcade on red clay shafts. The walls of chancel are of alabaster, inlaid with coloured marbles. Amongst the main features of the church are the frescoes executed by Mr. F. Preedy, from designs by the late Mr. Henry Styleman L'Estrange, of Hunstanton Hall, Norfolk. He designed ten frescoes for the east end. They illustrate the suffrages in the Litany—"By the mystery of Thy holy incarnation; by Thy holy nativity and circumcision; by Thy baptism, fasting, and temptation; by Thine agony and bloody sweat; by Thy precious death and burial; by Thy glorious resurrection and ascension; and by the coming of the Holy Ghost." They are painted in party colours by the water-glass process, like Mr. Maclise's picture in the Houses of Parliament. The reredos is of four arcades, surmounted with evangelistic emblems. The organ, by Mr. Holditch, is in the south choral aisle. The seats, to accommodate 800 persons, are of oak, as is also the pulpit, the base of which is stone, with red clay shafts.

A bell-frame for six bells has been erected by Messrs. Warner & Sons, and a bell, eventually to form the tenor, has been cast and hung by them, note E, about 18 cwt. 3 q. 20 lb.

There is a brass lectern and faldstool. A drinking fountain is attached to the railings of the church, in Baldwin's-gardens, and is supplied gratis by the Water Company.

A fine view of the interior of the church will be found in our last year's volume, p. 443.

SUBMARINE TELEGRAPHY.

THE ATLANTIC CABLE.

A PAPER on the subject of submarine telegraphy with especial reference to the Atlantic cable was read by Mr. Thomas Webster, F.R.S., at the Society of Arts, Adelphi, on the 11th instant. The paper gave rise to an interesting discussion. It went into the question of route for the Atlantic cable, as well as that of its construction. The merits of the Arctic route were rather more favourably regarded than we think they should be, particularly as regards coast damage by icebergs, and the difficulties generally of the Arctic winter. Mr. Webster rightly considered a light cable preferable to a heavy one, such as the last; but admittedly the best mode of constructing such cables is not yet a settled point. At the close of his paper Mr. Webster remarked that—

"On the best construction of the cable, whether a combination of insulated copper wire laid centrically and spirally, protected by the iron wires laid straight, or nearly so, with hemp, asphalte, and similar materials, or other of the various combinations suggested; also, on the best system of insulation or insulators, whether gutta percha or india rubber, or compounds thereof, or other substances now in existence, and already, or hereafter, to be applied, an inquiry conducted by competent persons may lead to the most important results.

In conclusion, I would suggest whether this society may not be able to promote and facilitate such an inquiry, and materially to contribute to the solution of the question of the best system of telegraphic communication with the great American continent."

The most general opinion as to the question of a light or heavy cable, elicited during the discussion which followed, seems to have been also in favour of a light cable. Mr. F. Jenkin very much defended the present unsatisfactory state of things, heavy cables inclusive, with spiral iron coverings and straight core. He ended, however, by remarking that he had no doubt that before long the problem of a permanent cable in deep water would be solved.

The meeting was also addressed by Mr. Thomas Allen and by Mr. Walter Hancock, who made some remarks on the limited supply of gutta percha and india-rubber, the importance of which were hardly appreciated as they ought to be; also by Dr. Collyer, Mr. C. F. Varley, Mr. C. W. Siemens, and others; but the most satisfactory remarks were made by the Right Hon. J. Stuart Wortley, the chairman of the Atlantic Telegraph Company, who stated that it was a mistake to suppose that the company had *settled* anything as to the construction of the cable, or were bound to any particular firm or form whatever: all they could be said to have settled as to the cable was that in the main the route would be the same as before, with certain exceptions as to its disposal on the coasts.

Rear-Admiral Sir Edward Belcher suggested the appointment, by the council of the Society of Arts, of a committee for the purpose of investigating the whole subject; a suggestion which the chairman, Mr. W. Hawes, the vice-president, said would be laid before the council.

In summing up at the close of the discussion, the chairman said the question now arose as to what was the proper quantity of insulating material to use, and what was the best material for that purpose; and when they had settled that question they had to decide which was the cheapest and best mode of laying down the cable. These were difficulties which no one could doubt the energy and enterprise of this country would overcome; because, in the words of their late Royal President, if a body of Englishmen said they would succeed, their energy and indomitable courage never failed in accomplishing success.

GAS.

THE Yarmouth gas consumers are urging a reduction of the price of gas from 5s. to 4s. 6d. and 4s., according to quality consumed; and threaten a strenuous opposition to a Bill which is being applied for by the company, unless these terms are agreed to.

The Ipswich Gaslight Company's directors recommend a dividend of 10 per cent., and a balance of 985*l.* to be carried to their reserved fund, at same time reducing the price of their gas.

The report of the Bury Gas Company's directors also recommends a dividend of 10 per cent. on old capital, and 7½ on the new, besides paying what is called arrears of dividends on years when the per centage was less, and also laying "a solid foundation for the reserve fund" of 3,000*l.* which the law allowed them to make. The report was adopted, and the price of gas reduced from 6s. 8d. to 6s. 3d.

The Tunbridge Company have declared a dividend of 7½ per cent., and the Tunbridge Wells Company have reduced their price from 5s. 10d. to 5s. 5d.

The Stafford Company have declared a dividend of 7 per cent., free of income-tax.

Endeavours are being made at Bristol to have the price of gas reduced to the Plymouth price of 3s., or even lower; and a gas consumers' company is being threatened by the Gas Consumers' Association.

The Malvern Link gasworks are reported to have cost 5,281*l.*, pipes, &c., inclusive; and the company have already declared a dividend of 5 per cent. per annum for the second half-year of their existence.

The Cardiff Gaslight and Coke Company have resolved to reduce the price of their gas from 4s. 3d. to 4s., in the hope of an increased consumption.

The Newport Gas Company's directors report a depression in consequence partly of the reduction made in the price of their gas, which, however, has not prevented them from dividing the usual 10 per cent. on class A shares, and 3¾ths per cent. on class B shares; nor from announcing even a further reduction in price, of 5 per cent.

The Liverpool Company have agreed to a dividend of 5 per cent. for the half-year, being the first since the last reduction of price; which, however, only shows the elasticity of gas dividends under the pressure of reduced prices.

RAILWAY MATTERS AND TOWN DISFIGUREMENT.

THE numerous railways and bridges projected for the metropolis are exciting anxiety in the minds of those interested in the architectural aspect of the metropolis.

Mr. Tite asked the First Commissioner of Works in the Commons last week, whether the Government intended to institute any inquiry into these various projects, or to subject to any control the architectural character and construction of bridges crossing the Thames or the streets and roads which were interfered with?

In reply, Mr. Cowper admitted that some of the great undertakings which had done so much for the convenience of the metropolis had done so at the expense of a very great disfigurement of some of their principal thoroughfares. With reference to the first part of the question, he could only refer to the report of the Board of Trade, which enumerated twenty-nine railway undertakings affecting the metropolis and its suburbs. With regard to the latter part of the question, the subject could not be in better hands than in those of the President of the Institute of British Architects. He thought it likely that members representing the metropolis would be prepared with some proposal on the subject.

Mr. Lewis recurred to the same subject next day in a question put to the President of the Board of Trade, as to what protection to the public was afforded by that Board.

Mr. Massey, for the President, replied that he did not propose any special mode of dealing with this particular class of railways. The metropolitan schemes would be submitted to the general committee of railways, and by them be classified; and after they had undergone the process of investigation to which such schemes were subjected, he thought it very likely that many of them would disappear. He certainly agreed with the hon. member for Bath (Mr. Tite) that it was desirable in a case of this peculiarity that the public interest should be protected by giving powers to some body representing the public interest to appear before those committees, and to watch their proceedings; and named the Metropolitan Board of Works as the proper body; and promised to prepare a revision of the standing orders to enable that Board to look after all such schemes. Sir George Grey said the Government need not have any special control over such undertakings.

Lord Derby has also since brought the subject before the House of Lords.

At the London Court of Common Council last week, it was stated that the 20,000 shares which were taken by the corporation for the promotion of the Underground Railway had yielded a profit of 32,000*l.* on the sale already effected of 18,000 of them; and as the purpose in view of promoting

the formation of the line had been effected, it was resolved forthwith to dispose of the remainder of the shares.

The Bill before Parliament for the extension of the Great Eastern Railway to Finsbury-circus is exciting considerable interest. The measure is meeting with strong opposition from the inhabitants of the neighbourhood of the proposed terminus; and it has been rightly remarked that although open spaces such as Finsbury-circus are no doubt tempting to the cupidity of railway companies for the saving of their funds, that is no reason why the public or the Legislature should submit to have the few open spaces in the metropolis filled up with brick and mortar simply to save such companies the cost of obtaining sites for their stations.

The abominable eyesores in the shape of girder bridges lately put up in Southwark and elsewhere (discreditable to all concerned), and the threat of what is to be erected across Ludgate-hill, ought to have immediate attention.

Speaking of a proposed Metropolitan Railway for Dublin, the *Evening Post* for that city says:—"This project is causing great dissatisfaction in this city. Petitions against the Bill are in course of signature; and a requisition is also in preparation, requesting the Lord Mayor to convene a meeting of the citizens to avert what it is considered would be a deformity and serious injury to this metropolis."

MONUMENTAL.

Wedgwood Statue, Stoke-upon-Trent.—We are empowered to contradict the statement of a correspondent quoted by us from the *Staffordshire Advertiser*, describing the pedestal of the statue as ordinary red sandstone, although it has the appearance of red sandstone at a distance. It is, in fact, of the compact gritstone, from Mansfield.

Jacob Memorial.—A design for a monument to the late Major Jacob, for Salisbury Cathedral, has been furnished by Mr. Street, architect. It will consist of a series of arches, supporting a slab and inclosing a tomb. These arches will be supported by short columns of Purbeck marble, resting on a base of yellow Mansfield stone, supported by a pedestal of gray Forest of Dean stone. Beneath the slab and inclosed by these arches will be a coped tomb of Caen stone, resting on a base of red Mansfield. The arches will be of alabaster, and between them mosaics will be worked. The slab at the top will be of Purbeck marble, and will contain a brass foliated Gothic cross, with Mediæval sword and spurs, to indicate the rank of the major in the volunteer service. The caps of the columns will be carved with Gothic foliage. The whole monument will stand on a platform composed of white marble, with a pavement of inlaid mosaic, red marble, and various coloured stones. The dean and chapter have approved of the design.

MILITARY AND MONASTIC ARCHITECTURE.

A lecture, profusely illustrated, was delivered at the Church of England Institute, Newcastle, by Mr. F. R. Wilson, architect, Alnwick, on the Military and Monastic Life of the Middle Ages in Northumberland, on Monday, the 23rd inst. He suggested that the remains of our Mediæval architecture are more indicative of the manners and customs of our forefathers than any other relic we possess of them; and that they should be preserved with the most dutiful reverence. It is not the life of kings and nobles, of abbots and monks, that should be seen reflected in the ruins of our castles and abbeys, more than those of the masons, joiners, plumbers, smiths, and artist-workmen who wrought the stones, carved the timbers, rolled the lead, welded the iron, and moulded the decorations of these structures; and these grades and trades are equally interested in the conservation of our national antiquities. One of the illustrations consisted of a large map of the country, dotted with red crosses and circles. These marks showed the sites of the numerous Northumbrian castles and peel towers, and of the most celebrated border battlefields. Black crosses and circles on the same map showed the sites of churches and monastic buildings. A large drawing of "Alnwick Castle besieged" represented the mode of Mediæval warfare; and numerous photographs conveyed to the audience a sense of the beauty of many neglected ruins. Mr. Wilson also exhibited a portion of his Lindisfarne survey,—a measured and drawn-to-scale delineation of the churches between the Tyne and the Tweed.

THE ARCHITECTURAL MUSEUM.

Our readers may be glad to hear of some movement here. We learn from the honorary secretary that cards for a course of lectures will shortly be issued. The session will be opened with an address from the President, Mr. Beresford Hope, and will include the following lectures:—"On Mediæval Studies in Palestine," by Mr. J. G. Wigley; "On the Ely Lantern," by the Dean of Ely; "On Construction and Ornament, old and new," by Sir Henry Dryden, Bart.; "On Architectural Mosaics," by Dr. Salviati; "On the Art Collections at South Kensington, considered in reference to Architecture," by Mr. J. C. Robinson; "On Architecture, its Purpose and its Place among the Arts," by Mr. T. Gambier Parry.

The prizes of 1863 will consist of two (20*l.* and 5*l.*) for a carved miserere, and two for coloured decoration (5*l.* 5s. and 3*l.* 3s.), the latter being offered, as usual, by the Ecclesiological Society and Mr. Beresford Hope. Full particulars of the competition will, of course, be made known without delay.

PREMIUMS FOR WOOD CARVING.

In consequence of a communication from the Society of Wood Carvers, the Society of Arts have arranged to hold an exhibition of wood carving, both modern and ancient, in the month of June next. The council have further agreed to offer the Society's silver medal and to make a grant of 30*l.*, the Society of Wood Carvers giving 15*l.*, as a fund for prizes to be awarded to the most meritorious exhibitors.*

Mr. S. C. Hall has liberally added three guineas, as an extra prize.

The first prize in the first division, human figure in alto or bas relief (animal or natural foliage may be used as accessories) will be 8*l.* and the Society's silver medal.

Employers or private owners may be exhibitors, but *bonâ fide* workmen only can receive prizes.

The judges will be selected, four by the council of the Society of Arts, and three by the Society of Wood Carvers.

COMPETITIONS.

Leicester.—Sir: I have enclosed you a circular received by us, soliciting a "sketch for a monument" for the late Mr. J. F. Hollings. I have also enclosed you our reply to the same, which we have sent to the various local newspapers. If you will kindly insert this we shall feel obliged. H. G.

THE HOLLINGS MEMORIAL.

Sir,—As the memorial to the late Mr. Hollings is a subject of considerable interest to the town, will you oblige us by inserting a word or two as to the proposed competition for its design?

The sub committee of the Memorial Fund have issued a circular "to the Architects and *Designers* of Leicester and the neighbourhood," invoking them to send in sketches for a "monument;" but as the word "designer" is so unlimited in its application, and in the sub-committee's reading of it includes persons who have actually applied to architects of the town *to make designs for them*, the architects beg to decline the honour of the competition, at the same time wishing the committee every success in their labours, from the respect we each entertain for the memory of the late J. F. Hollings, Esq.—We are, Sir, yours obediently,

Dain & Smith,
Goddard & Son,
Shenton & Baker,
William Millican,
W. Jackson,
R. J. Goodacre,
James Bird,
Jas. Frank Smith.

STAINED GLASS IN ST. PAUL'S CATHEDRAL.

Your correspondent "G. R." has written to ask me certain questions, and has requested an answer in your columns.

1. "Would the authorities of St. Paul's permit a painted memorial window to be put up over the altar, the lower central window of the six?"

2. "What would be the probable expense, to be done by the best artists? The design to be submitted to and approved by the authorities of the Cathedral."

The Dean and Chapter desire to see the six windows of the apse filled with stained glass, and have conceded the window spoken of by your correspondent to the Drapers' Company. They have further put the design in the hands of Professor Schnorr, in concert with the Cathedral surveyor; and the glass is to be executed at Munich, at the Royal Stained Glassworks. The cost will not, it is believed, exceed 600*l.* Professor Schnorr has also been desired to prepare, at the same time, on a smaller scale, designs for the other five windows of the apse, to be executed as opportunity shall offer, also at the Munich works.

Should your correspondent think proper to avail himself of these conditions, the Dean and Chapter would be very glad to concede one of the upper or lower windows; except, of course, that which has been given to the Drapers' Company. The subjects are, 1, "The Agony in the Garden;" 2, "The Crucifixion:" this is the window to be given by the Drapers; 3, "The Burial;" 4, "The Resurrection;" 5, "The Ascension;" 6, "The Day of Pentecost."

I may also mention, that all other windows which occur in the end walls of the nave or transepts are designated for stained glass, and the great west window is already given by Mr. Thomas Brown. The subject, "The Conversion of St. Paul." The design, likewise, is being prepared by Professor Schnorr, and the glass is to be executed at Munich.

A short inscription, of a memorial character, might form part of the window.

F. C. Penrose.

PREPARATION FOR THE ARCHITECTURAL EXAMINATIONS.

The result of the recent examinations at the Institute having been made known, together with the report of the examiners, will you permit me to make a few suggestions which, I think, will tend to give greater success to this new experiment? And, first, let me remark that, considering the very elementary character of the examination in the class of Proficiency, a larger number than eight out of nineteen candidates might have been expected to have passed. In "pass" examinations at the Universities, *one-third* or *one-fourth* of the candidates is considered a large number to be "plucked," but here we have more than *one-half* placed in that unenviable position. Having myself had much experience in the preparation for examinations, I know the difficulty experienced by persons in studying for them from books alone without aid from a competent instructor. It is the same as if a man were to attempt to drill himself for the army without a drill-sergeant to direct him. I would, therefore, suggest that either the Institute or the Association should form evening classes for the study of the particular subjects required in these examinations; each class to be presided over by some one who has given his attention more especially to that particular branch. This would give students of architecture the means of acquiring branches of knowledge which they have now but little opportunity of learning. For although there are classes for these subjects at the colleges in London, yet it is necessary, in order to avail oneself of them, to enter as a regular student, and thus trench upon the office work of the day, which but few are in a position to do.

I believe such classes, if under able direction would answer well, and would be self-supporting, the fees (after deducting expenses), to go to the teacher of each class. E. W. Tarn, M.A.

EXPLOSIVE BUSINESSES: NOXIOUS BUSINESSES.

Perhaps it may not be known to many persons carrying on the above-mentioned businesses within the metropolitan district that (in pursuance of the unrepealed sections of the Metropolitan Building Act, 1844), after August, 1864, no manufactu... of gunpowder, detonating powder, matches ignitable by friction or *otherwise*, or other substance liable to sudden explosion, inflammation, or ignition; or of vitriol, turpentine, naphtha, varnish, fireworks, or *painted table-covers;* nor any oth... manufacture dangerous on account of the liabili... of the materials or substances employed therein to cause sudden fire or explosion, will be allowed to be carried on, either in buildings or vaults, or ... the open air, within 50 feet from any other buil... ing, or any other vacant ground belonging to a... other person than the landlord of the manufa... turer, or within 40 feet from a public way, *whether it is an old-established business or not.*

Persons carrying on noxious and offensive bu... nesses nearer than 50 feet to a dwelling-house, 40 feet to a public way, if old-established bu... nesses, are left till August, 1874.

* The Society of Wood Carvers (Newman-street, Oxford-street) have also offered, as we are reminded by Mr. Lock, the honorary secretary, the sum of 15*l.*, in three sums, for the best work sent in to the Exhibition of the Society of British Sculptors, which opens in April next.

Gas-works seem to be included in the restriction to August, 1864, except in respect of works authorized by Acts passed before 1844, within the districts then lighted by them.

It would be well for persons carrying on any of the above businesses to read the sections 54 to 63 of 7 & 8 Vict., c. 84, carefully.

R. HESKETH.

ARCHITECTURAL SOCIETIES AND THE PRESS.

SIR,—I am sorry to see that the same illiberal, narrow-minded spirit which has been displayed at the Institute with regard to publishing the papers read there is spreading to the Association, having been introduced by a member of the Institute. Now, sir, I maintain that this is a movement tending greatly to the injury of the younger members, and ought, if possible, to be nipped in the bud, being wrong on the face of it. My own case will illustrate this. On the evening when the lecture referred to was read, I was engaged on business, and so looked forward to your report of the same, which, of course, was not forthcoming. There is another reason why the papers should be published, and that is the importance of educating the public in art matters; which these same gentlemen uphold, saying that it will further the interests of art and architects if the public taste be improved (and there is a large field for it), and yet they countenance a movement diametrically opposite: for I cannot conceive a better plan for attaining this object than by giving publicity to lectures on art in the *Builder*; whereas, if brought out as Transactions, they would be seen by a very limited number, who are perhaps already acquainted with their contents. I trust you will, with your known sense of justice, insert this. ARCHITECT.

A WORD FROM CLERKS OF WORKS.

SIR,—Will Mr. Rickman be good enough to explain his meaning a little more clearly when, in his paper on the position of measuring surveyors, he says,—"I would much rather be brought into contact with an intelligent builder's clerk than with a clerk of the works."

The words in their present form seem to cast a slur upon the abilities and intelligence of clerks of works in general; but, as a clerk of works, I would willingly hope this is not intentional: if so, surely Mr. Rickman's opinion is not generally shared by the profession to which he belongs? S. W.

Books Received.

Bruges et ses Environs. Description of the Monuments, Works of Art, and Antiquities; preceded with an Historical Notice. By W. H. JAS. WEALE. London: Barthé & Lowell, Great Marlborough-street. 1862.

MR. JAS. WEALE, who is known as an accomplished writer on art and archæology, has produced an admirable little guide (in French) to a knowledge of the history and antiquities of Bruges, a town interesting alike by its associations and contents. Until quite recently Bruges had preserved more than any other town in Belgium its Mediæval aspect; but this is now rapidly disappearing under the hands of modern Vandals. Mr. Weale denounces strongly the present course of restoration to which the old buildings of Belgium have been or are being subjected. At the Hôtel de Ville of Bruges he describes sad work. He says they have changed the character of all the sculpture; they have placed in niches statues the costumes of which are anachronisms, and which statues are too large for the niches they occupy; and have inserted tracery in the windows without connexion with the construction. There remain now in the façade only some rare morsels of the old work, easily to be recognised. The Guide is adorned with two maps, one of Bruges, the other of its environs.

Miscellanea.

BELL-CASTING, COLCHESTER.—On Monday, the 23rd instant, was cast at the foundry of Mr. Dearn, in Colchester, a small bell for the church of Furtwengen, in the state of Baden; this being the first church bell made in Colchester. The metal was the gift of Messrs. Peter & George Dold, of this town. The bell is decorated with crosses, inscribed in circles, and with suitable inscriptions in Latin, recording the names of the "founders" and benefactors; and will be "consecrated," according to our correspondent, at St. James's Church, next Sunday, the 1st March.

ARCHÆOLOGICAL DISCOVERY AT ROTTINGDEAN.—To improve the cricket-ground on "The Beacon," it became necessary to remove a low hillock or tumulus of a circular form, and about 30 yards in diameter. Near the centre of the tumulus the workmen met with a grave, of oval form, containing the skeletons of four adult persons, lying with their heads towards the north. Near the south side of this grave or vault was a small urn of sun-baked clay, and of sufficient capacity to have contained the remains of an infant. Four other oval graves were found.

SOUTH KENSINGTON MUSEUM.—During the week ending 21st February, 1863, the visitors have numbered 10,337.

THE FATAL ACCIDENT AT COAL DEPÔT, PADDINGTON.—The inquest in this case has terminated in a verdict of "Manslaughter" against John Edwards, the manager to Messrs. Smith & Knight, the contractors, and William Lester, the contractor for the removal of the soil and the sinking of a well; on the ground that they had not taken proper precautions for the prevention of such an accident as that which had occurred.

VENTILATION OF THE CELLS AT WESTMINSTER HOUSE OF CORRECTION.—At a recent general meeting of Middlesex magistrates, the Deputy Clerk of the Peace laid before the court a letter received by him from the Home-office, returning the plans of alterations for ventilating certain cells in the House of Correction at Westminster, as approved by Sir George Grey, Home Secretary. Mr. G. F. Franco then moved—"That the visiting justices at the House of Correction at Westminster be empowered to cause the old cells in the double wings of section A of the prison, containing 148 cells, and comprising about one-third of the total number included in the drawings laid before the court on the county day of the November session, 1862, when the same shall have been approved or modified by the Secretary of State for the Home Department, to be warmed and ventilated at an expense not exceeding 1,500*l*." Mr. Kemshead said he believed that they were going rather too far in their endeavours to make the prisoners comfortable; and the consequence was that the prisoners did not care about the punishment. It was his opinion that they ought, in the first instance, to let them have a taste of imprisonment without the luxury of a fire. After a short discussion, however, the motion was put and agreed to.

THE DANISH KING'S KEEPSAKE TO THE PRINCESS ALEXANDRA. — Dagmar, the "Darling Queen" of Denmark, died in 1212, and was buried in Ringsted church. She was carried to the grave adorned with a costly jewel, which lay on her breast. In the time of Christian V., when her tomb was opened, this cross was taken care of, and is now one of the most precious objects preserved in the Museum of Northern Antiquities. This golden cross, which is about 1¾ inch long and 1 inch broad, is covered with figures in enamel on both sides, and is supposed to be of Byzantine workmanship. It is the only enamelled cross which is known to be older than the year 1212. It is always beheld with veneration by the crowds who visit the museum, for it speaks of a lady beautiful beyond compare, who died in the bloom of youth, and who demanded neither goods nor gold, broad acres nor stones of price, as her morning gift, but only asked Valdemar the Victorious, her lord and master, to free the peasantry from their plough-tax, and the poor prisoners from their fetters. We learn from the *Danmark*, that the king has caused an exact copy of this cross to be made by the Court Jeweller, Mr. Diderichsen, as part of a rich diamond necklace given to the Princess Alexandra on her leaving the shores of her country.

TENDERS.

For works proposed to be done at Carpenden, near Watford, Herts, for alterations and addition to the mansion for Mr. R. R. Carrow. Mr. Bartlett, architect. Quantities supplied:—

Wood, Brothers	£7,777	0	0
Downes	7,720	0	0
Mansfield	7,550	0	0
Ryder	7,178	0	0
Conder	6,924	0	0
Piper & Wheeler	6,742	0	0
Chalk	6,400	0	0

For new church, roads, and fences, at North hill, High gate. Mr. A. W. Blomfield, architect. Quantities supplied by Mr. J. A. Bunker:—

Child & Son	£2,650	0	0
Broadbent	2,507	0	0
Browne & Robinson	2,496	0	0
Wheeler	2,445	0	0
Turner & Sons	2,399	0	0
Carter	2,390	0	0

For the erection of a public house at Wavertree, Liverpool, for Mr. Joseph Lace. Mr. William Paice, of London, architect:—

Stanley	£3,114	0	0
Bottom & Co.	2,890	0	0
West	2,760	0	0
Foster	2,500	0	0
Laws	2,320	0	0
Hill (accepted)	2,210	0	0

For residence, Buckhurst-hill, Essex. Messrs. John Young & Son, architects:—

	House.		Gardener's Cottage.		Total.
Hart	£1,855	..	£155	..	£2,010
Rivett	1,742	..	133	..	1,875
Patman	1,695	..	135	..	1,830
Salter	1,590	..	130	..	1,720
Chessum	1,390	..	125	..	1,515
Browton	1,265	..	89	..	1,354

For building three cottages in Albert-road, Bancroft-road, Mile-End, for Mr. W. Owen. Mr. W. P. Griffith, architect:—

Ebbage (accepted)	£395	0	0

For a pair of cottages at Pialstow, Essex. Mr. James Tolley, architect:—

Perry & Judson	£620	0	0
Watts	535	0	0
Fisher	514	0	0
Payne (accepted)	505	0	0

For building a public hall at Camden Town, for Mr. Ludbrook. Messrs. Sandall & Selway, architects. Quantities supplied by Mr. Gritten:

Mundy	£1,780	0	0
Gammon	1,695	0	0
Haward	1,650	0	0
Colls & Co.	1,644	0	0
Patrick	1,618	0	0
Sharpington & Cole	1,597	0	0
Arnold	1,378	0	0

For workhouse, Shoreditch. Mr. Wm. Lee, architect. Quantities by Messrs. Linsdell & Gliffard:—

Neill	£65,020	0	0
Scott	57,200	0	0
Pritchard & Son	57,000	0	0
Wood & Sons	53,975	0	0
Scrivener & White	53,917	0	0
Hack & Son	53,944	0	0
Dethick	53,917	0	0
Myers & Sons	53,749	0	0
Sawyer	52,853	0	0
Macers	51,165	0	0
Stap	50,750	0	0
Palmer	50,000	0	0
Hill, Keddell, & Robinson	48,855	0	0
Loft	47,346	0	0
Hart	46,768	0	0
Perry	46,750	0	0

The last four tenders being selected from the rest were voted for by the guardians, and resulted in favour of Mr. Perry, whose tender was accepted.

The tender of Mr. Macers has been accepted for building the Fine Arts Gallery, for Mr. E. Lloyd, at Vauxhall Bridge. Mr. Wm. Lee, architect.

The tender of Mr. Jarvis has been accepted for the five houses to be built for Mr. F. Powling, at Haggerstone. Mr. Wm. Lee, architect.

For the erection of one pair of villas, at Baker-street, Enfield. Mr. Thomas Joseph Hill, architect:—

Barker	£1,379	0	0
Cushing	1,375	0	0
Plowman	1,312	10	0
Field & Son	1,130	0	0
James & Ashton	988	0	0
McPherson	950	0	0

For the erection of three pair of semi-detached villas at Enfield. Mr. Thomas Joseph Hill, architect

Cushing	£4,115	0	0
Plowman	3,937	10	0
Field & Son	3,353	0	0
James & Ashton	2,888	0	0
McPherson	2,859	0	0

For new parsonage-house and stables, at Fogmore, Herts —

	House.			Stables.		
Simms	£1,500	0	0	£	0	0
Thompson	1,396	0	0	282	0	0
Jackson & Shaw	1,270	0	0	227	0	0
Rhodes & Roberts	1,242	0	0	215	0	0
Young	1,218	0	0	217	0	0
Bottom & Co.	1,218	0	0	210	10	0
Wells	1,212	0	0	212	0	0
Lathey	1,202	0	0	188	0	0

THE *Daily News*, July 1st, speaking of Benson's watches in the Exhibition, says:—"Here are arranged a fine selection of watches manufactured by him on the latest and most approved principles of horological science. When we compare them with the specimens of ancient watch-work which are placed beside them, or even with those worn by our grandfathers, the immense advance in this branch of the mechanical arts is at once apparent." Chronometer, duplex, lever, horizontal, repeaters, centre seconds, keyless, split seconds, and every description of watch, from the plainest to the highest quality of which the art is at present capable, and adapted to all climates. Benson's Illustrated Pamphlet on Watches (free for two stamps) contains a short history of watch-making, with descriptions and prices. It acts as a guide in the purchase of a watch, and enables those who live in Scotland, Ireland, Wales, the Colonies, India, or any part of the world, to select a watch, and have it sent free and safe by post. J. W. BENSON, Prize Medallist, 33 and 34, Ludgate-hill, London. Established 1749.—[Advt.]

THE "PIONEERS OF BRITISH INDUSTRY."

Now ready, with 7 Portraits, and nearly 300 Illustrations, 3 vols. 8vo. 63s.

LIVES OF BRITISH ENGINEERS.

FROM THE EARLIEST PERIOD DOWN TO THE DEATH OF ROBERT STEPHENSON.

With an Account of their Principal Works, and a History of Inland Communication in Britain.

BY

SAMUEL SMILES,

Author of "Self Help," &c.

CRITICAL NOTICES.

"I have just been reading a work of great interest, which I recommend to your notice—I mean Smiles's 'Lives of the Engineers.' No more interesting books have been published of late years than those by Mr. Smiles. What we want in this country is earnestness and nothing can be better adapted for this purpose than the examples held out to us of successful and persevering energy, such as are to be seen in the great lives which Mr. Smiles has given us."—*Sir Stafford Northcote.*

"A chapter of English history which no one could have written so well as Mr. Smiles. It is a history of the growth of the inland communication of Great Britain by means of its roads, bridges, canals, and railways; and a survey of the lighthouses, breakwaters, docks, and harbours constructed for the protection and accommodation of our commerce with the world."—*The Times.*

"A very delightful account of some of the great captains of industry. The book is full of interest and instruction."—*Spectator.*

"A book which has at once the conciseness necessary to render it valuable to the professional man, and the interesting character which makes it acceptable to the general reader."—*Mining Journal.*

"Mr. Smiles may fairly claim the merit of having produced one of the most interesting and instructive works that have been published during the present year."—*London Review.*

Also, by the same Author, and to be had separately,

LIVES OF GEORGE AND ROBERT STEPHENSON.

Forming the Third Volume of the above Work.

With 2 Portraits and 70 Illustrations.

8vo. 21s.

"In the life of Robert Stephenson, Mr. Smiles enters upon new ground, and has produced a biography little inferior in interest to his former narrative of the career of George Stephenson."—*London Review.*

"Mr. Smiles's third volume of 'The Engineers' contains the biographies of George Stephenson and his son Robert. It is impossible fully to comprehend either without the other. Father and son understood one another better than any other person. It is delightful to contemplate these two great men in their intercourse with each other."—*Daily News.*

"Mr. Smiles has enjoyed the active co-operation of those who were able to throw a light upon the subject, including Robert Stephenson himself."—*Mining Journal*

GEORGE JENNINGS,
Sanitary and Engineering Depôt, Holland street, Blackfriars-road.

DURABILITY of GUTTA PERCHA TUBING.—Many inquiries having been made as to the Durability of the Gutta Percha Tubing, the Gutta Percha Company have pleasure in giving publicity to the following letter FROM SIR RAYMOND JARVIS, Bart., VENTNOR, ISLE of WIGHT.—Second Test received "March 10th, 1852.—In reply to your letter received this morning, respecting the Gutta Percha Tubing for Pump Rods, I am glad with much satisfaction to answer perfectly. Many builders and other persons have lately examined it, and there is not the least apparent decrease of the first year's use, now several years, and I am informed that it is to be adopted generally in the houses that are being erected here."
N.B. From this testimonial it will be seen that the CORROSIVE WATER of the ISLE of WIGHT has no effect on Gutta Percha Tubing.
THE GUTTA PERCHA COMPANY, PATENTEES,
18 WHARF ROAD, CITY ROAD, LONDON.

VENETIAN BLINDS should have LEWTAS'S NEW PATENT ACTION which ENTIRELY SUPERSEDES the HOOKS and annoyance of winding the cords. Can be easily fixed to old blinds. Price, 2 cord actions 2s.; 3 cord do. 3s. A liberal commission to the Trade. To be had of—
EDGAR PARKS, Ironmonger and Sole Agent,
140, Fleet street London

THE CITY of MANCHESTER PATENT BRICK & TILE COMPANY, LIMITED (FEERTZ'S PATENT)
Capital, 50,000 in 1,000 shares of 50 each. Deposit, 1 per share on application, and 10s. per share on allotment. Registered under the Companies Act of 1862, with limited liability.
DIRECTORS.
W. NICHOLSON, Esq., Chairman,
(late Managing Director of the London and Manchester Glass Company)
W. Routledge, esq. (Messrs. Routledge & Ommanney).
F. Heroner, esq. (Messrs W. F. Higson & Co)
E. Tomlinson, esq. (Messrs. Tomlinson & Jones)
E. J. Hughes, esq. (Messrs. Hughes & Bloe Smith).
W. Weild, esq. C.E. Queen's Chambers, Market street.

CONSULTING ENGINEER. W. Weild, esq. C.E.
SUPERINTENDING ENGINEER. Peter Effertz, esq. C.E. (the Patentee).
SOLICITORS.—Messrs. Atkinson, Sounes, & Co.
BANKERS.—Messrs Cunliffe, Brooks, & Co.
The Directors having now completed the preliminary arrangements, and the Company being duly registered, are prepared to receive and execute orders forthwith, both for the machines (under royalty), bricks, tiles, and drain-pipes.
The Directors very confidently invite application for the remaining shares. A considerable number are already subscribed for, and an allotment will be shortly made.
The Directors reserve to themselves the right to limit the first issue of shares.
With machines made under this patent, bricks can be produced superior to hand-made, at one-half the present prices.
The machines may be seen at work on application. Samples of bricks, tiles, and drain pipes, can also be seen at the Company's Offices, where forms of application for shares and full information may be had.
T. F. S. HUGHES, Secretary.
India Buildings, Cross street, Manchester.

Temporary Offices, 30, Parliament street, Westminster
The object of this Company is to extend the manufacture of the Patent Concrete Stone, one of the most remarkable discoveries of modern times. By a chymical combination of great simplicity, materials almost valueless are converted into stone, so that sand, gravel, chalk, clay, and the like are formed into blocks of any size or shape, or moulded to any pattern, which, in a few minutes, without burning, becomes stone of hard and imperishable character. No 1 one of the units of which it is composed, and it does not shrink in the least. It is compared with natural stone, is most materially reduced in price in the first instance, and is almost universal adaptability, and is applicable for all way works, docks, fortifications, &c. as well as to the every day requirements of builders, for purposes, columns, window dressings, steps, and floors, pavements, guttierings, mouldings, tombs, &c. It will resist the effects of the smoky atmosphere of large towns, and also the saline influence of the sea coast, so injurious to all stone buildings.
It has been extensively employed upon the several stations of the Metropolitan Railway, on the London, Chatham, and Dover Railway, and elsewhere. A solid block, measuring 7ft. 10in. long by 3ft. 6in. wide, by 9ft. high, weighing upwards of two tons, was exhibited in the Western Annexe of the International Exhibition, and used as the foundation of a steam engine), for which the Prize Medal was awarded.
The promoters of this Company have been able to enter into a very advantageous arrangement for the purchase of the patent for making the "concrete stone," through all the winds of the United Kingdom, the last and most important of which being awarded April, 1861, together with a stock of materials, machinery, and plant, comprising an extensive factory at Ipswich, and brick works at Norwich. The Ipswich works are in full convenient operation, supplying the West Indies, and upwards of 1,000 workmen, warehouses, yards, saw mills, engine and boiler houses, steam cranes, and two eight horse power steam engines and boilers, dissolving, grinding, mixing, and adding apparatus, together with every complete convenience, and also the effects of models and moulds, all open for the inspection of this Company. The Norwich works comprise an extensive range of well-erected buildings, containing a steam engine with suitable machinery and plant. They have also a wharf upon the navigable river, within a short distance of the railway station. The above works are in full working order, and the only expense for the present arrangements, all delays in commencing the remunerative operations of this Company are avoided.
From the facility of manufacture and the small outlay required for the establishment of works, it is proposed to carry on the business of this Company, mainly, by granting licenses throughout the United Kingdom, retaining the immediate management of the works at Ipswich and Norwich, in the metropolis, for the direct operations of the Company. It is also further proposed to extend the application of the stone to external coating, and the repair of stone in existing buildings. Many important applications for licenses are now under consideration
The prospects of success may be very shortly summed up as follows
1. In the very cheap production of a building material of the best quality for all ornamental and ordinary purposes.
2. In the enabling licenses to make this useful material in any given locality without incurring heavy expenses for plant or buildings.
3. In the application of a process (the best hitherto known) as a weather-proof coating, and for the preservation of buildings already erected.
From these sources may be anticipated an immediate and ample return of profit, in the capital invested.
The patent concrete stone has been subjected to the most severe tests, and has not only withstood the ordeal, but obtained an unqualified testimonial from one of the most distinguished professors of chymistry in London, whose name has been thoroughly endorsed by eminent engineers, architects, and builders.
A copy of the Articles of Association can be seen, and prospectuses obtained, at the temporary offices of the Company, or from the Brokers, to whom applications for shares are to be sent.

MONEY.—IMMEDIATE CASH ADVANCES MADE ON
FREEHOLD, LEASEHOLD, and COPYHOLD PROPERTY
TIMBER, WINE, and other WAREHOUSES
BANKRUPTS' and INSOLVENTS' CASES CONDUCTED
Balance-sheets Prepared, and Meetings of Creditors Convened
Mr. RICHARD CROSSLEY, ACCOUNTANT and BUSINESS AGENT,

N.B.—The "Spectre Drama" every morning and evening this week, except Tuesday and Wednesday, at 3 past 1 and 4 past 7. Ye Faery Romaunte of Cinderella.—Know ye well that a certain jongleur (or menestrel) hight Lionel Brough, by much pryngo into ye legends, hath come ryghte clerkly to knowe ye historie of Ye Fayre Maydo, Cinderella, and that he will relate ye same unto all comers, at ye Polytechnic, each day, at 4 by ye dial after noontide, and ye hour of 9 after curfew.

FREEHOLD GROUND between the Forest Hill and Sydenham Stations TO BE LET on long Building Leases.—For plan and particulars, apply to C. F. REEKS, Esq. Architect, 12, Middle Scotland-yard, S.W.

TO BUILDERS and OTHERS.—TO BE LET, several PLOTS of BUILDING LAND, situate in the best part of Stoke Newington, where houses are in great demand. Bricks supplied on the estate at a low price. Sand may be raised on the ground for building purposes. Apply to Mr. RODDA, at the Estate Office, Bouverie-road, Church street, Stoke Newington.

CATERHAM, on the Surrey Hills, 17 miles from London.—LAND TO BE SOLD or LET, in plots of from 4 to 20 acres, for first-class residences, either on the hill or in the valley. Healthy soil. Ample supply of the best spring water to the tops of the houses.—Apply to Mr. R. MARTIN, Estate Office, Caterham.

PHILBROKE ESTATE, at Leytonstone, on the Woodford and Loughton Railway, twenty minutes from Fenchurch and Bank Jegular Stations.—This valuable FREEHOLD ESTATE (land tax redeemed), surrounding the Scats in, healthy locality, gravelly soil, excellent drainage, water and gas laid down, roads made, and can be let on the estate, it is proposed TO LET in Plots suitable for building detached and semi-detached villas. Repeated applications have been made for leases in this neighbourhood. For terms, apply to Mr. ATHEY, at the Surveyor's Office, Philbroke Estate, Leytonstone, Essex.

WOODFORD RAILWAY.—The GROVE, WANSTEAD.—Portions of this beautiful Estate are now TO BE LET for Building purposes, and Villa Residences are much required in the locality. Soil gravel, situation healthy, and water excellent. The Snaresbrook Station is only 5 yards only from the Estate, and the City is reached in twenty-five minutes. The Leases will contain a clause entitling the Lessee to purchase the Freehold within a specified time. LAND also TO LET at Blackheath, Tottenham, Kingston; some very eligible SITES in the Grove-road, Mile-end, a few of which are adapted for shops, and large and very CHEAP PLOTS TO LET, at Ealing.—Apply to Mr. KNIGHTLEY, Architect, 26, Cannon-street.

ST. HELEN'S, Lancashire.—TO BE LET on LEASE, the extensive MANUFACTURING PREMISES known as the Ravenhead Copper Smelting Works, situate at St. Helen's, with a wharf on the canal, and a branch of the St. Helen's Railway running through the property. The entire site is about twenty acres, of which about five acres are occupied by the works, the remainder being ornamental pleasure ground. The buildings comprise a series of very substantially erected, light, and lofty ground floor factories, arranged for the purposes of copper and silver refining works, but they will be available for many other large manufacturing establishments, as they possess the advantages of direct communication by rail or water carriage with all parts of the kingdom. Coals can be obtained from pits in the neighbourhood at an almost nominal price, and labour is cheap and abundant.—For particulars apply to Messrs. FULLER & HORSEY, 13, Billiter-street, London, E.C.; and Messrs. HARRISON & FINCH, 2, Gray's Inn, London.

BUILDING LAND TO BE LET, HACKNEY, close to the Railway Station, for small Dwelling Houses.

NORWOOD, close to the Crystal Palace, for Shops and Villas.

PERRY-HILL, SYDENHAM, for Shops. Advances in each case if required.—Apply to Mr. T. K. GREEN, 25, College-hill, Cannon-street, E.C.

LITTLE HEATH BRICKFIELD, Cobham, Surrey.—TO BE LET, for the season or for a term, this FIELD, situate about three miles from the Esher Station, where there is a store shed, and about 2½ miles from the Leatherhead Station. Excellent red bricks, for which there is a large demand, can be made with a small amount of firing. Also yellow, malm, and stock bricks, pipes, tiles, &c. If let only for the season, the proprietor would purchase any bricks left unsold at Christmas next, at a price to be fixed beforehand.—Further particulars can be had at Examples seen at Mr. ASHFIELDS, Builder, 3, Baynes-row, Coldbath-fields, London; or at the Esher Station.

WATERSIDE PREMISES.—WANTED, UP THE RIVER, COVERED SPACE, 10,000 square feet; UNCOVERED, 20,000 square feet. Well protected, and good shute. Lowest terms to be addressed to Messrs. WALLER & SCOTT, Solicitors, 75, Coleman-street, E.C.

FREEHOLD BUILDING GROUND.—To LAND SOCIETIES and OTHERS.—For SALE, TWELVE ACRES of FREEHOLD LAND (in whole or part), situate near a railway station, about five miles from Bishopsgate well adapted for the erection of an institution, villas, or dwelling houses. Price low.—Apply to Mr. JOHN M. DEAN, Architect, The Grove, Stratford, E.

TO ARCHITECTS.—OFFICES TO BE LET, fan ished or unfurnished. Two good ground-floor rooms with extensive lights, in the immediate neighbourhood of the British Museum.—Apply to Mr. C. J. BAKER, 65, Great Russell-street, Bloomsbury, W.C.

TO ARCHITECTS and OTHERS.—TO BE LET, THREE LIGHT ROOMS, on the First Floor. Suitable for offices.—Address, 19, Southampton-street, Strand. Rent, 30l. per annum.

ELIGIBLE BUILDING ESTATE, HORNSEY ROAD, UPPER HOLLOWAY, TO BE LET, at moderate ground-rents.—For plans and particulars apply to Mr. A. D. GOUGH, Architect, 10, Lancaster-place, Waterloo Bridge, W.C.

SHORTLY WANTED, on Lease, within a mile of Charing cross, SPACE for the erection of an Iron Building of about the size of a temporary church, with a good entrance. Frontage no object. Reply by letter, stating situation and extent of space in superficial feet, rent, length of lease, &c. to M. A. 1, Cornwall Villas, Kentish Town, N.W.

HOLME HEAD BAY.—TO BE LET, by TENDER, the BUILDING of a STONE BAY across the River Caldew, at Holme Head, near the City of Carlisle. Plans and specifications may be seen at the Office of Messrs. FERGUSON, Holme Head Works. Mr. SMETHURST, Assistant to T. I. Bateman, Esq. C.E. will be in attendance daily at Holme Head, and give all necessary information as to the Works.—Sealed Tenders to be delivered at the Office of Mr. GEORGE MOUNSEY, Solicitor, Friars Court, Carlisle, on or before the 5th MARCH next. The Proprietors do not bind themselves to accept the lowest Tender.

Carlisle, 19th February, 1863.

TO ARCHITECTS and SURVEYORS.—OFFICES in the House of a Solicitor, near the British Museum, are OFFERED. Mutual business arrangements might be effected, particularly with a Gentleman acquainted with Benefit, Building, or similar Societies.—Apply C. D. or personally, 6, Caroline-street, Bedford-square, W.C.

RICHMOND, Surrey.—Valuable FREEHOLD LAND TO BE LET for BUILDING.—1st. The substantial mansion known as Suffield House, capable of being divided into two residences; frontage 62 feet, depth 145 feet. 2nd. The frontage next Paradise road, 44 feet, depth 55 feet. 3rd. The frontage next Eton-street, 120 feet, and depth average 53 feet. 4th. The frontage next Marsh gate-road, 40 feet, depth 173 feet. The whole of the above lots are situated within five minutes' walk of the railway station.—To view, apply at the Mansion; and for particulars, to Mr. W. HUDSON, Architect, 19, Bennet's hill, Doctors' Commons.

TO BUILDERS, SPECULATORS, and OTHERS.—TO BE LET, on a long Lease, TWO HOUSES, possessing a frontage of 72 feet to the busy thoroughfare of Blackman-street, Borough, by a depth of 217 feet. One house has for many years been licensed as a tavern, and the other possesses extensive premises in the rear. There are likewise Warehouses, Carpenters' Shedding, and other useful Buildings adjoining, which readily command tenants and produce a good rental. Further particulars can be obtained of HENRY HYDE, Esq. Solicitor, 32, Elp-place, Holborn; and of Messrs. PRICKETT & SON, Land Agents and Surveyors, 62, Chancery-lane, W.C. and Highgate, where a plan of the property can be seen.

CLERKENWELL.—TO BE LET, by TENDER, on repairing lease, those eligible CORNER PREMISES known as 49, Turnmill-street, and 78, Clerkenwell-green, close to the Sessions House, and near to the Farringdon-street Station of the Metropolitan Railway. Tenders to be sent in on or before the 18th MARCH next, addressed to the Trustees of St. James's, Clerkenwell, and endorsed "Tender for Premises, Clerkenwell-green."—Further particulars may be had by applying at the Vestry Hall, 22, Upper Rosoman street, any day from TEN till FOUR.—By order,

February 25, 1863 ROBERT PAGET, Vestry Clerk.

CHELSEA.—BUSINESS PREMISES TO BE LET, situated No. 126, King's road, Chelsea, being the most commanding premises in the parish. Suitable for workshops, warehouses, and show-rooms.

TO CONTRACTORS. TO BE LET, in one or four Contracts, the EARTHWORK, CLAYING, and STONE-PITCHING required for the RE-CONSTRUCTION of 4,000 lineal yards of the SEA EMBANKMENT near Herne Bay, Kent. The whole Drawings and Specifications may be seen at the Office of Messrs. GARLICK & PARK, Civil Engineers, 23, Whitehall-place, Westminster, from the 25th instant to MARCH 9th.

FREEHOLD LAND TO LET on Building Leases, facing Reulah-road, Norwood, suitable for erecting three or four first-class Detached Villas. Ten minutes' walk of station on Crystal Palace line. Also Leasehold Land at St. John's Wood, for small Villas.—Apply on the Premises to Mr. HAMILTON FLETCHER, Architect and Surveyor, Bond Court House, Walbrook, E.C.

EALING, MIDDLESEX.—FREEHOLD BUILDING LAND TO BE LET (detached or semi-detached houses in the best part of Ealing, overlooking the Common, and within five minutes' walk of the Railway Station), communicating with the Metropolitan Railway. Roads made, Gas and Water laid on.—Apply to W. W. POCOCK, 45, Craven-street, Strand.

CONTINENTAL BANK CORPORATION.—PREMISES WANTED, in close proximity to the Bank of England, for this Corporation. Any one who can offer the Lease or Freehold of suitable premises, on reasonable terms, is requested to apply by letter, stating terms and full particulars, to the Secretary, at the temporary offices of the Corporation, 98, Cannon-street, E.C.

FREEHOLD SITES for BUILDING, and FREEHOLD HOUSES, can be obtained in the best part of Prince Albert's-road, near Kensington Gore, in front of the Royal Horticultural Gardens.—Apply to C. J. RICHARDSON, Architect, 47, Prince Albert's-road, N.W.

GUILDHALL, 26th February, 1863. The Committee for Letting the City's Lands will meet at GUILDHALL, on WEDNESDAY, the 11th MARCH next, at ONE o'clock precisely, to receive PROPOSALS for LEASES of a House, No. 6, Bricken-wharf, Upper Thames-street; a House, No. 29, Tabernacle-row; Two Houses, No. 46, Banner-street, and No. 25, Coleman-street; Twelve Houses, Nos. 1 to 12, in King's Arms-court, Windmill-street, Finsbury-pavement; Two Houses, No. 8, Old street, and No. 11, Bagged-row, St. Luke's. Plans of the property may be seen, and forms of Tender obtained, upon application at the Architect's Office Guildhall.

FERDINAND BRAND, Comptroller.

TO PLUMBERS, PAINTERS, and GLAZIERS.—WANTED, a small BUSINESS, in the suburbs of near London. Apply to Mr. SIMMONS, 13, Holywell street, Strand, London, W.C.

TO DECORATIVE HOUSE-PAINTERS. The Advertiser, who has most successfully carried on business in Edinburgh for forty years as a DECORATIVE HOUSE-PAINTER, now finds it necessary, from the state of his health, to RETIRE from Business. He is now most reluctantly compelled to DISPOSE of the GOODWILL of the BUSINESS and his STOCK IN TRADE, on reasonable terms. To a person of enterprise, so favourable an opportunity of entering upon a business of the highest class rarely offers. The premises in which the business is carried on are well known. They are most eligibly situate, square exterior, and complete. The purchaser of the Business can obtain them either on a Sale or Lease. Further particulars may be learned by addressing to X. Y. Z. care of Messrs. Robertson & Scott, News Agents, No. 13, Hanover-street, Edinburgh. Principals only will be treated with.

TO PLUMBERS, GLASS-CUTTERS, and SMALL CAPITALISTS.—TO BE DISPOSED OF, a first-rate CONCERN, in the above trade, situated in the most central and thoroughfare in South London, three miles from London Bridge, with an unexpired lease of ten years. As it is a genuine affair, and the most satisfactory reasons can be given for the present proprietor retiring, none but bona fide parties will be treated with.—Apply to E. CLARKE, Esq. Grove-road, Walthamstow, Essex, N.E.

TO PLUMBERS, PAINTERS, GLAZIERS, and GASFITTERS.—TO BE DISPOSED OF, through failing health of proprietor, a BUSINESS, established forty years, situate in one of the best thoroughfares out of London, S. The lease, fixtures, stock, &c. 700l. First-rate premises. A partner not objected to.—Apply, by letter, H. C. B., T. Kernot, esq. 13, Welbeck-street, W.

TO BUILDERS and CONTRACTORS.—TO BE DISPOSED OF, in a good town near London, an old-established BUSINESS, in full work, with considerable connexions, good yard, stable, and workshops, and a comfortable dwelling house, the present proprietors being about to retire from it. Apply to J. W. D. at Mr. Moore's, 223, Shoreditch.

FOR SALE.—An ENGINEERING and BOILER-MAKING BUSINESS TO BE DISPOSED of, by PRIVATE TENDER. The Works are situated at Corkickle, near Whitehaven; the Machinery, Tools, and Patterns are all modern, and in first-rate condition. The business is now in full operation, and has been increasing satisfactorily for the last few years.—All particulars may be ascertained on application to Mr. Peter Cameron, Banker; or Mr. John Whittle, Iron Merchant, Whitehaven; also from Mr. Nathaniel Caine, Iron Merchant, Liverpool.

Whitehaven, February 5th, 1863.

TO ENGINEERS, IRONFOUNDERS, &c. The Proprietor of an Old-established Engineering Concern in the Midland Counties, being about to retire from business, would DISPOSE of his PLANT and INTEREST on very moderate terms. This is a good opportunity for a young man with a small capital at command, as the stock will be reduced to suit his views, and liberal arrangements may be made.—Address, A. B. 367, Pershore road, Birmingham.

TO BUILDERS.—TO BE DISPOSED OF, the BUSINESS of a CARPENTER, BRICKLAYER, and BUILDER, now and for many years past extensively carried on in one of the best market towns in Hertfordshire, situate about twenty-four miles from London, and contiguous to a Railway station. The buildings, workshops, and sheds are compact and well arranged; and a comfortable Residence, with garden and meadow, are attached to the premises. The Stock, tools, &c. to be taken at a valuation, the amount of which would probably not be more than 700l. or 800l.—For further particulars apply, personally or by letter, to Messrs. GROVER & STOCKEN, Bencl Hempsted, Herts.

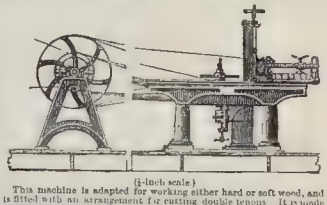
TO PLUMBERS, PAINTERS, and GLAZIERS.—TO BE DISPOSED OF, in consequence of the decease of the proprietor, an OLD ESTABLISHED BUSINESS in the above line, situate in the vicinity of Cavendish-square.—For particulars apply to Mr. BARNARD, 11, Wimsley street, Oxford-street, W. No agent can be treated with.

TO BRICKLAYERS, BUILDERS, &c.—TO BE DISPOSED OF, a genuine BUSINESS in the above line. The House and premises are in good repair, and every convenience for carrying on a large trade. Twenty-seven miles from London, three from a station on South Western Railway. For further particulars apply to R. B. Printing Office, Chobham, Surrey.

TO BUILDERS and OTHERS.—TO BE SOLD, with immediate possession, close to Kennington green, a desirable and increasing BUSINESS in the above line; returns between 5,000l. and 6,000l. a-year. Premium, 200l.; stock at a valuation.—For further particulars apply to Mr. BRAY, Estate Agent, 164, King's-road, Bedford row, W.C.

TO BUILDERS, &c.—TO BE SOLD, the GOODWILL (with the Lease) of an Old Established BUSINESS in the above trade. The premises are convenient for carrying on the same to a large extent. Distance within three miles of the four metropolitan bridges.—For terms and particulars, apply to Mr. PERKINS, Auctioneer, &c. 26, Tooley-street, corner of Hay's-lane, Southwark, S.E.

FOR SALE, an IRON CHURCH, with FITTINGS, Cambridge heath, Hackney. This first class structure, capable of seating about 600 persons, is now FOR SALE, part of the Building having been newly and partly erected only a few years than twelve months.—To view, and for conditions of sale, apply to Dr. LEONARD, 14, Critchill-place, New North-road, Hoxton, N.

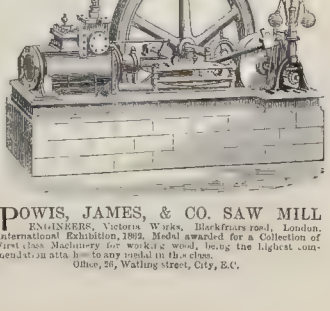


TO IRONMONGERS AND THE TRADE GENERALLY.

D. HULETT & CO. Manufacturers of GAS CHANDELIERS, HALL LANTERNS, GLASS LUSTRES, &c. &c. A large assortment of the newest designs always on show, every article marked in plain figures. Patentees, and Manufacturers of the Mercurial Gas Regulator. Complete Pattern-book and Price-lists, 12s.—Nos. 55 and 56, High Holborn.

FOR SALE, a CAST-IRON TANK, 33 feet long, 18 feet wide, and 4 feet deep, capable of containing upwards of 1,000 gallons, with corrugated iron lid, delivery and outlet pipes; 7 iron girders, 30 feet long, 3 inches wide, and 12 inches deep; and 4 iron pillars, 14 feet long and 4 inches in diameter.—For price and further particulars apply to C. ROCHFORT, Secretary to the Newport Caerleon & Wales Railway Company, 151, High street, Newport, Isle of Wight.

February 25th, 1863.



S. WORSSAM & CO.'S PATENT IMPROVED TENONING MACHINE.

(¼-inch scale)

This machine is adapted for working either hard or soft wood, and is fitted with an arrangement for cutting double tenons. It is made in two sizes the smaller being adapted for ladders and joints per pens, and the larger for railway carriage builders, &c.—For priced illustrated circulars, with full particulars, apply at the Works, 304, King's road, Chelsea, S.W.

IMPROVED HORIZONTAL HIGH-PRESSURE STEAM-ENGINE

POWIS, JAMES, & CO. SAW MILL ENGINEERS, Victoria Works, Blackfriars road, London. International Exhibition, 1862. Medal awarded for a Collection of First-class Machinery for working wood, being the highest commendation attached to any medal in the class.

Office, 26, Watling street, City, E.C.

OCTAVIUS N. SIMPSON, STAMFORD;
and see Specimens at the Office of
Messrs. PINDER SIMPSON & SONS, 29, Savile-row, London, and at the Museum of Practical Geology, Jermyn-street, W.
This stone (which is a perfect oolite), is raised in blocks of any portable size, and is about four feet thick in the bed. It will stand ANY WEATHER, is much used for water-works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the kingdom.

TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION.
MAGNUS'S ENAMELLED SLATE obtained the Medal of the Society of Arts, the Prize Medal at the Great Exhibition, 1851, Two First-class Medals at the Paris Exhibition, and Two Prize Medals at the International Exhibition of 1862.
Trashy imitations of this beautiful material are being palmed upon the public. Architects are therefore requested to see that the name of "MAGNUS" is upon each article.
Chimney-pieces, Billiard-tables, Table-tops, Baths, Wall-linings &c. a New Illustrated Catalogue of which can be had at the Pimlico Slate Works, 39 and 40, Upper Belgrave-place, Pimlico, S.W.

POLONCEAU and LIMMER ASPHALTE.
ESTABLISHED 1838
For covering Flat Roofs, Paving and Flooring of every description, especially in places subject to damp and vermin. This Asphalte is now extensively used for paving Stables (as shown above), the absence of joints preventing the generation of ammonia. For Estimates and Prices, &c. &c. apply to JOHN PILKINGTON, 15, Fish street-hill, London, E.C.
Country Builders supplied with Asphalte in Bulk for covering Footings, Barn Floors, &c. with instructions to lay it down.

HAY'S PATENT WATERPROOF GLUE and INDIA-RUBBER VARNISH.—To ARCHITECTS, BUILDERS, PAPER HANGERS, &c. &c. The WATER-PROOF GLUE is a special anti-damp, and is suitable for contractors, joiners, coffin-makers, &c. &c. The VARNISH for damp walls, previous to papering, coating zinc verandahs, &c. &c. Copy of a letter from Messrs. Rogers & Booth, contractors, Gosport:—
"We have repeatedly used your Waterproof Glue as a preventive against damp, and have found it most valuable in preparing walls to receive paper. In one instance, where the walls were thoroughly saturated with moisture from earth filled against the outside, we used your varnish internally, and papered the surface, within a few hours of its being applied, with complete success. We have also used your preparation for coating a large number of cast-iron piles, at the Dockyard, Portsea, for her Majesty's War Department."
To be had from all Ironmongers, Oil and Colourmen, &c.
Manufactory, Chandos street, Portsmouth: Mr. GEORGE WEEKS, Manager. GEORGE C. WARDEN & CO. General Agents, 12, London-street, London, E.C. where specimens of its application can be seen.

London House, Mr. THOMAS BEGGS.

ESKHOLME'S PATENT PNEUMATIC REGULATOR and VALVE CLOSET.

Suitable for first and second class houses, being most efficient and simple, free from all smell and requires no cisterns, service boxes, cranks, wires, or levers, but is complete in itself, ready for attachment to any ordinary house service pipes. It is supplied in three qualities, each equally efficient, differing only as to the style of fitting up. A second class quality is also manufactured. The Regulators are usefully applied to the ordinary Pan Closet, alike dispensing with all cisterns, service boxes, levers, cranks, wires, &c. The Regulator is supplied separately, as well as connected to ordinary direct Service Main Cottage Water Closets.

Nine-tenths of the purchase money may remain on mortgage or contract, at 5 per cent. payable in nine years by equal half-yearly instalments; but the whole or any part of the balance may be paid off at any time without notice. Particulars, plans, and conditions of sale may be obtained at the Inns in the neighborhood; of Messrs. RUSSELL & DAVIES, 59, Coleman-street, E.C.; of the Auctioneer, 14, Moorgate-street, London, E.C.; and at the Place of Sale.

WIMBLEDON, Surrey.—Eligible FREEHOLD BUILDING LAND.

MR. WHITTINGHAM is instructed to SELL by AUCTION, at the MART, opposite the Bank of England, on TUESDAY, MARCH 17, 1863, at TWELVE for ONE o'clock, in fifty one lots, the valuable FREEHOLD BUILDING LAND, free from tithe and land-tax, with frontages to the high road to Merrow from Tithe and the new road called Hartfield-road, contiguous to the Wimbledon Station on the main line of the London and South Western Railway. The corner directly opposite the station is most eligible for a tavern. Nine-tenths of the purchase money may remain on mortgage or contract at 5 per cent to be paid in nine years by half yearly instalments; but the whole or any part of the balance may be paid off at any time without notice.—Particulars, plans, and conditions of sale may be obtained at the Inns in the neighborhood; of Messrs. RUSSELL & DAVIES, 59, Coleman street, E.C.; of the Auctioneer, 14, Moorgate-street, London, E.C.; and at the Place of Sale.

GEORGE MITCHELL'S MARBLE and STONE WORKS, WALTON STREET, BROMPTON, S.W.

Notice of PRIVATE SALE of about 200 MARBLE CHIMNEY-PIECES, to be sold at very reduced prices to make room for a Stock removed to the Premises, in the following Marbles:—Statuary, Rouge Royal, Black and Gold, Black, Sienna, Bardilla, Dove, California, St. Anne's, Rouge Sapet, Jaune Piccare, Brocatello, Genoa Green, Irish Green, Blue Belge, Emperor's Red, Irish Fossil, Campaine Mottange, Vein, Sicilian, and various excellent specimens of British Marbles, varying in price from 1l. 10s. to 50l.; and for elegancy of design, workmanship, and quantity, not to be surpassed in England. Purchases to the extent of 30l. and 5 per cent. allowed if delivered from the Stock in the 14 days, less 2½ per cent. each. Purchasers from the country will be supplied with packing-cases, and the same packed and delivered to any of the metropolitan stations for 1 per cent. on the amount purchased.

NEW LAMBETH BRIDGE.—To Contractors, Builders, and Others.

PULLEN, HORNE, & EVERSFIELD are instructed by Messrs. Foster & Co. in consequence of the completion of their Contract, to SELL by AUCTION, near the new Suspension Bridge, Lambeth, on MONDAY, MARCH 2, at TWELVE for ONE, a quantity of surplus MATERIALS; comprising 150 loads of timber in piles, booms, braces, walings, &c.; 3,000 feet of 3-inch planks, 200 scaffold boards, and 150 scaffold poles, a very excellent iron traveller by sundry ladders, barrows, mortar boards, trestles, &c.; also two boats and other effects. The timber may be viewed on the shore, near Lambeth Palace, and the remainder of the lots at a shed in Cumberlow, Westminster, and catalogues had of PULLEN, HORNE & EVERSFIELD, 10, Parliament street, Westminster, S.W.; and 80, Fore-street, City, E.C.

MESSRS. F. HALL & SON will SELL by AUCTION, on TUESDAY, MARCH 3rd, at TWELVE o'clock, on the PREMISES, as above, the Six Sided Small and Kite-3 Arms, Chester-street, Kensington-road, about 600 long yellow deals, white deals, 2 very dry clear pine plank, and various, 1,000 feet new quartering, 50 squares of yellow and white flooring boards, 2,000 feet of 2-inch and 1-inch elm boards, 2,000 feet of chestnut planks and boards, 500 feet of dry clean 1½-inch elm for chair-making, 5,000 feet of lunettes, sycamore, birch, ash, beech planks and boards, 5 large flat and round butchers' blocks, useful horse, spring cart and harness, marble slabs, old building materials, and other effects. For particulars see Catalogues on the premises and of the Auctioneers, Kensington, S.

DENHAM-COMMON, on the Wells-road, in the parish of Lewisham, midway between Sydenham Station and the Crystal Palace.—Valuable Freehold Land, divided into small plots for building purposes.

MESSRS. FAREBROTHER, CLARK, & LYE are instructed to SELL, at GARRAWAY'S, on WEDNESDAY, MARCH 11th, at TWELVE, in one or thirty three lots, several valuable FREEHOLD BUILDING LANDS, situate on Sydenham-common, in the parish of Lewisham, six miles from London, and about midway between the Sydenham Station of the London, Brighton, and Croydon Railways and the Crystal Palace; comprising three acres of land, with extensive frontages to the Wells road, opposite Wells-terrace; and also to Taylor's-lane, leading to the Longton Hotel. The whole is divided into small plots, with frontages varying from 20 to 50 feet. All the land contains valuable brick earth. Immediate possession may be had.—Part cash, with notes, may be had on the Property, at the ten-pound, Sydenham; of RICHARD TAYLOR, Esq. Solicitor, 3, Field-court, Gray's-inn-square; at Garraway's, E.C.; and at the Offices of Messrs. FAREBROTHER, CLARK, & LYE, 6, Lancaster-place, Strand, W.C.

THE CLIFF, SCARBOROUGH.—To BUILDERS and OTHERS.

EXTENSIVE SALE of BUILDING MATERIALS, &c.

MR. WM. TASKER HART has received instructions from the Scarbrough Cliff Hotel Company, Limited, to SELL by AUCTION, on the PREMISES, on THURSDAY, MARCH 5th, 1863, the whole of the BUILDING MATERIALS, except the bricks of the Building Houses, Nos. 1, 2, 3, 4, 5, 6, and 7, with the Five Cottages, situate on St. Nicholas Cliff, and which said buildings are to be pulled down, and the materials carried away on or before the 31st of March. Several of the houses have been built within the last eighteen years, and contain timber and other materials of the best description. Each house will be put up for separately. Sale to commence at ONE o'clock. The whole of the houses will be open for inspection four days prior to the sale. For further particulars apply to CUTHBERT BRODRICK, Esq., Architect, Leeds; or to Mr. WM. TASKER HART, Scarborough.

SOUTHGATE, MIDDLESEX.—EXCELLENT MATERIALS OF A CHURCH.

MR. A. RICHARDS will SELL by AUCTION, on THURSDAY, MARCH 5th, at ONE, by order of the Churchwardens, the whole of the MATERIALS of Weld Chapel: including a handsome stained glass window, the lead on the nave and church, ninety pews, sound timber of roofs and floors, oak story posts, 1,000 stock bricks, thirty squares of slating, York paving, doors, windows, and many other of materials.—On view the day previous. Catalogues obtained of the Auctioneer, Tottenham.

WELD CHAPEL, SOUTHGATE.

MR. A. RICHARDS will SELL by AUCTION, on THURSDAY, MARCH 5, at ONE, by order of the Churchwardens, a handsome STAINED GLASS WINDOW, 8 feet 6 inches by 8 feet, with finely executed figure of Christ in the centre.—View the day previous. Catalogues obtained at the Church, and of the Auctioneer, Tottenham.

CAMDEN TOWN, NEAR COLLEGE STREET NORTH.

MESSRS. LEREW & LEREW will SELL by AUCTION on the PREMISES, CAMDEN TERRACE, on MONDAY, MARCH 9, at TWELVE, the STOCK of Mr. TIMBER DEALER and BUILDER: comprising 8,000 feet dry yellow deal, 3,000 feet lath, 2,000 and pine, 1,500 feet dry pine mould, 1,800 planks, deals, and battens, 120 pieces of flooring, 2,000 feet quartering, large quantity of oak stuff, 18 doors, ladders, strong spring van, two carts, &c.—Auction offices, Cardington-street, Hampstead road, near the Euston Station.

MINTON, HOLLINS, & CO. Stoke-upon-Trent, beg to inform architects, the gentry, and others, that, in consequence of the increasing demand for their Encaustic and Mosaic Pavements, and with the view of facilitating the execution of orders, they have opened a NEW DEPÔT for the sale of their Establishment, No. 50, Conduit street, London, where experienced draughtsmen will be constantly in attendance, to afford all information required.

DRAWINGS and ESTIMATES, on the receipt of plans, will also be promptly furnished, on application at the Manufactory, Stoke-upon-Trent.

MINTON & CO. take the present opportunity of stating that they have always in stock a large and varied assortment of tiles, suitable for Hearths, Dados, Panels, and Borders of Halls, Churches, &c.

MINTON & CO. further give notice, that they have no special depôt in London for their general pavements, but keep in stock and execute orders, but the same may be obtained of all the principal dealers.

TERRA COTTA and FINE STONEWARE POTTERY, warranted to stand Frost.

JOHN M. BLASHFIELD, STAMFORD POTTERY, STAMFORD, LINCOLNSHIRE, has greatly improved and economised the manufacture of Fine Stoneware, and solicits ORDERS FOR ARCHITECTURAL PURPOSES. He is able to make it of various new colours, so as to harmonize with Marble, Portland, and other Stones, and to equal in hardness to Granite.

A Medal at the International Exhibition was awarded, in Class 10, Section 1, Architectural Objects, for "Terra Cotta in manufacture and in the work so formed." A Medal was awarded for Terra Cotta.

Moulded Bricks, String Courses, Copings, Cills, Tracery, Balusters, Capitals, Crosses, Terminals, Vases, Urns, Finials, Brackets, Consoles, Gargoyles, Gutterings, and Quarries, for Paving Purposes, &c. &c.

Also, Plain and Mosaic Pavements for Halls, Churches, Conservatories, &c. in all colours.

London Office, 377, Oxford-street, W.

STAFFORDSHIRE RIDGING and ROOFING TILES, Plain and Ornamental, in Blue or Brosely colour. PAVING TILES in various sizes and weights.

Blue Vitrified Grooved and Chequered Pavings for stables, pathways, wareh use, &c.

Drain Pipes, Tiling BUILDING and SEWER BRICKS.

Architects, &c. may be supplied direct on the shortest notice.

Illustrated Price List forwarded on application.

JOHN & WILLIAM EASTWOOD,

Belvedere-road, Lambeth, and Kent-road Bridge.

BILLING'S PATENTS. CHIMNEY TERMINALS, THROAT VALVES.

NOTICE to ARCHITECTS. The Proprietors of the late Mr. Billing's Patents have secured the services of Mr. H. H. COLLINS, M.I.B.A. of No. 10, Poultry, E.C. as the Consulting Architect, from whom full particulars and the reduced prices may be obtained; or from the Manager, Mr. TYLER, 13, Abingdon-street, Westminster, S.W.

COMPETITIONS.

TO ARCHITECTS.—The Town Council of Gateshead invite DESIGNS for the PROPOSED NEW TOWN HALL and CORPORATE BUILDINGS. A premium of 100l will be paid to the author of the designs to which the Town Council shall award the first place, and a premium of 50l. to the author of the designs to which they shall award the second place. The designs are to be delivered, free of cost, at the Office of the Town Clerk, on or before the 1st of MAY next; and the two designs to which premiums shall be awarded will become the absolute property of the Town Council, without any condition whatever. A copy of the conditions of competition, settled by a building in designs, and a lithographic copy of the plans and sections of the ground will be supplied to competitors on application to the undersigned, and on payment of a charge of 5s.—By order,

J. W. SWINBURNE, Town Clerk.

Town Hall, February 13, 1863.

THE LANCASHIRE INSURANCE COMPANY.—To ARCHITECTS.—The Directors of the Lancashire Insurance Company are desirous of RECEIVING DESIGNS for OFFICES, for the Company, and other BUILDINGS, to be erected on the plot of land at the corner of Exchange street, St Ann's-place, and Red Lion-street, Manchester. The following premiums will be given for the best designs:—First, the sum of 50l. for the work, or 200l. at the option of the Board of Directors; second, 100l.; third, 50l.—A plan of the site, and full printed particulars, may be obtained, on application to the General Manager, with whom the designs must be left, on or before the 1st day of MAY.

GEORGE STEWART, General Manager.

Exchange street, Manchester,
20th February, 1863.

MEMORIAL to the late J. F. HOLLINGS, Esq. of Leicester.—The Sub-Committee invite DESIGNS for a MONUMENT to the above Gentleman, to be erected in the Grounds of the Town Museum. The cost must not exceed 200 guineas. A premium of 5l. will be awarded to the best design, whether selected for execution or not. Mr. Hollings had been Mayor of the Borough, and President of the Literary and Philosophical Society; and was admired by his fellow-townsmen for his exertions on behalf of all educational institutions, for his literary and scientific attainments, and for his kind-heartedness and liberal spirit. Designs, marked with a motto in the usual way, and accompanied by a sealed letter containing the address, may be forwarded to W. CHARLESWORTH, Esq. 27, New Walk, Leicester, not later than the 23rd of MARCH.

CONTRACTS.

COAST GUARD CONTRACT.—NOTICE to BUILDERS and CONTRACTORS.

Persons desirous of TENDERING for the ERECTION of a COAST GUARD STATION at Shingle End, near Southend, in the County of Kent, may inspect the Drawings and Specifications at the Custom House, Basingstoke, or at this Office, between the hours of TEN and FOUR, from MONDAY, the 2nd, to SATURDAY, the 14th day of MARCH now next ensuing, and both inclusive (Sunday excepted).

Tenders to be sent to this office not later than TWELVE o'clock at NOON on MONDAY, the 16th MARCH, under seal, and addressed to the Commodore Controller General of Coast Guard, and endorsed "Tender for Shingle End."

The Lords Commissioners of the Admiralty do not pledge themselves to accept the lowest or either of the Tenders.

Dated this 20th day of February, 1863, at the Admiralty

Coast Guard Office, 12, Spring Gardens, London, S.W.

LONDON and NORTH-WESTERN RAILWAY.—To CONTRACTORS. The Directors are desirous of receiving TENDERS for the CONSTRUCTION of the RAILWAY from Acton, through Runcorn, to Ditton, with Branch from Runcorn to the Duke's Dock, in the counties of Cheshire and Lancashire, a distance of eight miles, or thereabouts. Parties desirous of Tendering may see the drawings, and obtain a statement of the quantities, upon application to Mr. WILLIAM BAKER, Engineer, Euston Station, on TUESDAY, MARCH 3rd, between the hours of TEN and FOUR o'clock. Tenders addressed to the Secretary, at this Office, to be sent in on or before WEDNESDAY, MARCH 18th, at FOUR o'clock p.m. The Directors do not bind themselves to accept the lowest Tender.—By order,

Euston Station, February 23, 1863.

CONTRACTS.

EXTENSION of TIME for receiving TENDERS, CITY of LONDON, BARBERS' HALL.—Important SITE for WAREHOUSES or MANUFACTURING PREMISES in the immediate vicinity of Wood street, Cheapside.—The Committee of the Worshipful Company of Barbers will meet at their Hall on THURSDAY, the 26th day of MARCH, 1863, to receive TENDERS for LETTING, on a Building Lease for 99 years, the Extensive PREMISES known as Barbers' Hall, situate in Monkwell street, Wood-street, comprising three houses fronting Monkwell street, Nos. 32, 33, and 35, part of the courtyard in the rear thereof, the passage leading thereto, and the greater portion of the Company's Hall, together with the kitchen, scullery, and outbuildings, having a frontage towards Monkwell-street of about 84 feet by an average depth of about 118 feet, and an extreme depth of about 134 feet. Full particulars, with a plan of the property, elevation and section of street-front, also conditions of letting, may be obtained on application to the Clerk of the Company; to Mr. CHARLES JOHN SHOPPEE, the Company's Surveyor, No. 61, Doughty street, W.C.; or to the Beadle at the Hall. By order, HENLEY GROSE SMITH, Clerk.

4, Wantford-court, Throgmorton street, E.C.

TO BUILDERS.—Builders disposed to CONTRACT for BUILDING a DWELLING-HOUSE, containing ten rooms and offices, at Box, near Bath (about a quarter of a mile from the Station, on the Great Western Railway), may see the drawings and specification at the Offices, from 10 to 12 on the 10th of MARCH, except on TUESDAY, the 10th. Tenders either for the whole of the work, or for one or more of the several trades, to be sent in to me on or before TUESDAY, the 24th inst. endorsed "Tender for House at Box." The lowest Tender will not necessarily be accepted.

MANNERS & GILL, Architects.

1 Fountain-buildings, Bath, March 4, 1863.

TO GAS ENGINEERS, CONTRACTORS, and OTHERS.—The Directors of the Cardigan Gas and Coke Consumers' Company, Limited, are prepared to receive PLANS, SPECIFICATIONS, and TENDERS for the ERECTION of GAS-WORKS for the town of Cardigan, about 2,000 inhabitants, twenty-seven public lights. The lowest offer will not necessarily be accepted. The plans rejected will be returned to the respective owners. Plans, &c. to be sent to the Chairman of the Board of Directors, THOMAS DAVIES, Esq. Bank House, Cardigan, on or before SATURDAY, the 21st of MARCH next.

L. LOWTHER, Secretary.

Cardigan, Feb. 19th, 1863.

CIRENCESTER CORN HALL.—To BUILDERS.—Persons desirous of CONTRACTING for the ERECTION of NEW PUBLIC BUILDINGS, and PRINCIPAL ENTRANCE to CORN HALL, in Dyer-street, may see the working drawings and specifications at Messrs. MIDLAND, MABERLY, & MIDLAND'S Offices, Gloucester, on and after 2nd MARCH.—Sealed Tenders to be addressed to Mr. R. K. HAGOOD, Hon. Secretary, Cirencester, on or before 12th MARCH.—The lowest Tender will not necessarily be accepted.

R. K. HAGOOD, Hon. Sec.

Cirencester, February, 1863.

PERSONS desirous of TENDERING for the ERECTION of a DOUBLE VILLA at Darlington, may inspect plans and specifications at the Offices of THOMAS SIMPSON, Architect, Northgate, on and after WEDNESDAY, the 4th day of MARCH, until WEDNESDAY, the 18th; or at the Offices of JOSEPH PEASE, Esq. Darlington, on THURSDAY, the 19th day of MARCH, until THURSDAY, the 2nd of APRIL. Sealed Tenders to be addressed to JOSEPH PEASE, Esq. and delivered at the Offices last named, not later than MONDAY, the 6th day of APRIL. The lowest or any Tender not necessarily accepted.

MIDLAND RAILWAY.—The Directors are prepared to receive TENDERS for the REPAIRS and MAINTENANCE of the whole of the WEIGH-BRIDGES and WEIGHING MACHINES on the Midland Railway, for a term of three years, from the 1st day of MARCH next. The form of Contract may be seen, and further particulars obtained on application at the Engineer's Offices, Derby Station, on and after the 2nd of MARCH; and the Tender can be received after TEN a.m. on TUESDAY the 17th day of MARCH next. The Directors do not bind themselves to accept the lowest or any Tender. By order,

Derby, February 24th, 1863. G. N. BROWNE, Secretary

TO MASONS and PAVIORS.—The Commissioners of Sewers of the City of London will meet in the Guildhall of the said City on TUESDAY, the 10th of MARCH next, at TWELVE o'clock precisely, to receive TENDERS for the execution of such MASONS and PAVIORS WORKS as may be required by them to be done within the City, for a period of THREE YEARS, from the 25th day next, upon the terms contained in their specifications, printed copies of which may be obtained at the Office upon payment of the sum of 1l. 1s. each, which will be returned to such persons who shall send in a bond fide Tender. Persons Tendering are required to state the names and addresses of at least two substantial householders as their sureties to enter into bond with the Contractor for the due performance of the Contract. The Commissioners do not pledge themselves to accept the lowest Tender, and no bond required satisfactory; and no Tender will be received after TWELVE o'clock on the day of treaty. The party sending in proposals must attend personally or by duly authorised agents, on the day and hour mentioned.

JOSEPH DAW, Principal Clerk.

Sewers' Office, Guildhall, 23rd February, 1863.

ROYAL SEA BATHING INFIRMARY MARGATE.—Persons wishing to CONTRACT with the Court of Directors of the above Hospital for certain REPAIRS and PAINTING required to be done in the Spring season of the Works on and after the 9th instant, either at the Building, on application to Mr. SAVORY, the Superintendent, or at the Office of the Architect, Mr. POPE, 8, King's road, Gray's-inn, London.—Tenders to be delivered at the Hospital, Margate, not later than the 21st instant, addressed to the Executive Committee, and endorsed "Tenders for Repairs, Paintings, &c. Royal Sea Bathing Infirmary." The Directors will not bind themselves to accept the lowest or any Tender.

L. BACON, 5th March, 1863.

[For remainder of Contracts see next Page.

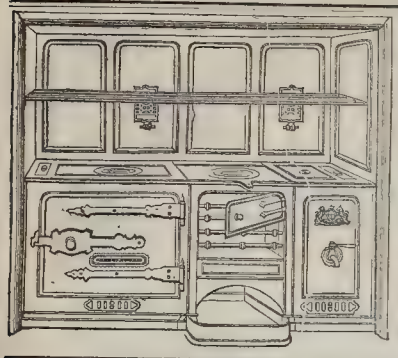
CONTRACTS.

VESTRY of ST. MARY, NEWINGTON, SURREY.—CONTRACTS for PAVING, CURBING, BROKEN GRANITE Guernsey, Dunbar, and Port Phillip), FLINTS (Kentish Rag, Gravel (with Screen Work), PUMP MAKERS' WORK, and WHEELWRIGHTS' WORK.—The Board of Guardians of the Parish will meet at the Vestry Room of the Parish, on MONDAY, the 9th MARCH next, at SEVEN o'clock in the evening, to receive TENDERS from Persons willing to CONTRACT for the SUPPLY and delivery of PAVING and CURBING to the several Parish Paving. Tenders must be sent in sealed, and endorsed "Tender for Paving," and must be delivered before the hour of SEVEN o'clock on the day of meeting. The Contractor will be required to enter into a Bond with two sufficient Sureties in the sum of £500 for the due performance of the Contract.

H. & W. CHESTER, Joint Clerks to the Vestry.

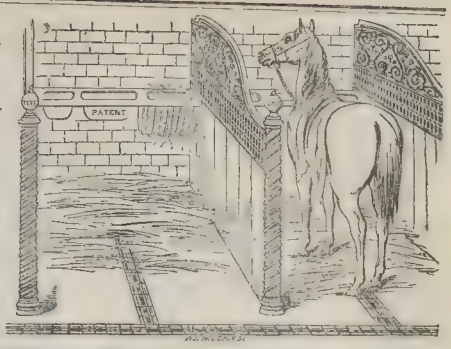
1, Church-row, Newington-butts.

TO BUILDERS and CONTRACTORS.—SHEPPEY GAS CONSUMERS' COMPANY (Limited).—TENDERS are invited for BUILDING a BRICK GAS HOLDER TANK, a METAL HOLDER, SMITH'S PLANT, and for certain ALTERATIONS and EXTENSIONS of the WORKS of the Company at West Minster, Sheppey, in all the plans, specifications, and forms of Tender may be inspected daily at the Office of Mr. JOSIAH HALL, Surveyor, Queenborough, Sheppey, Kent, between the hours of TEN and FIVE (but not on SATURDAY), the 14th day of MARCH next. Tenders are to be delivered at the Office of the Company, at Queenborough, on or before SIX o'clock p.m. on MONDAY, the 16th day of MARCH next, addressed to "The Secretary of the Sheppey Gas Consumers' Company (Limited)," at the Office of the Company, 14, Edward's-road, Banks Town, Sheerness, endorsed "Tender for Gasholder Tank," &c.—By order of the Board of Directors. A. W. MARKS, Secretary



Company's Office, March 3rd, 1863.

TO PAVIORS, MASONS, and OTHERS.—Notice is hereby given, that the Board of Works of St. Saviour's District will hold a meeting at their Offices, Emerson-street, Southwark, on WEDNESDAY, the 11th of MARCH, 1863, at SIX o'clock in the evening, to receive PROPOSALS for PAVING the STREETS, and the PASSAGES and PLACES, within the Parish of Christchurch, and the Liberty of the Clink, within the district, under Contract for Three Years from Lady-Day next, with power for the Board to determine the same at the end of the first or second year, at their own option; also to receive PROPOSALS for REPAIRING the PAVEMENTS of the streets and Places within the said Parish on Lump Contract. Separate Tenders for either of such Works will be received, the specifications of the Works required to be done, and the drafts of the Contracts, may be seen, and all particulars obtained, at the office. All persons Tendering must fill up one of the printed forms to be obtained at the Office, and deliver the same, sealed up and endorsed "Tender for Paviors" or "Masons' Work," to the Board, at their meeting, before SIX o'clock in the evening, as no Tender will be entertained after that time, unless the responsible persons as sureties. No other Proposals but those contained in such printed forms will be received, and the parties must be in attendance. The Contractors will have to execute Contracts, and they will have to enter into Bonds for the due performance of the same, and they will have to commence the respective works of each Contract immediately after the completion of the Deed. The Contractors will have to find Stamps for the Contract, and for the Bond. The Board do not bind themselves to accept the lowest or any Tender.—By order of the Board.



HERBERT STURMY, Clerk.

Offices, 3, Emerson street, Bankside, Southwark, March, 1863.

TENDERS for GUERNSEY GRANITE.—The St. Saviour's District Board of Works hereby give Notice, that they are ready to receive TENDERS from persons willing to supply them yearly with from about 1,000 to 1,500 cube yards of the best quality of Guernsey Granite, for three years from Lady-Day, 1863, to Lady-Day, 1866. The granite to be sent to a 3-inch ring, and no stone to weigh more than four ounces, and to be clean sifted from small stones. The granite to be delivered at such of the Parish Drawing-dock Basins, Southwark, respecting Brewery within the Parish, as the Surveyor may direct, and at the Contractor's expense for boards, wharfage, &c. The Parish Drawing-dock Basins, Southwark, respecting Brewery within the Parish, as the Surveyor may direct, and at the Contractor's expense for boards, wharfage, &c. and the Contractor is to be responsible for the cost of the Board; payment for same to be made within twenty-one days after delivery to the satisfaction of the Board. Tenders will be received for the whole or any part of the above-mentioned quantity, but in the event of more than one Tender being accepted, the Tenders for the largest quantity will be preferred. Tenders must be sent in sealed, and endorsed "Tender for Guernsey Granite," and must be delivered before the hour of SEVEN o'clock in the evening, on MONDAY, the 9th MARCH next, at the Board-room, Emerson-street, Bankside, Southwark, at which time and place the Tenders will be opened by the Board. Tenders must be delivered at the Office of the Board, at

ST. PANCRAS IRON WORK COMPANY,
OLD SAINT PANCRAS ROAD, LONDON, N.W.

PATENT WROUGHT-IRON STABLE FITTINGS
SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—
That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick, or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, WITH RACK AND WATER-TROUGH,
The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.
These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible; advantages peculiarly their own.

THE PATENT HARNESS FITTINGS
Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.

EVERY DESCRIPTION OF STABLE FURNITURE.

The PRIZE MEDAL for SUPERIOR PATENT SASH and BLIND LINES, was awarded to JAMES AUSTIN, at the INTERNATIONAL EXHIBITION, 1862.

AUSTIN'S IMPERIAL PATENT SASH and BLIND LINES
To BUILDERS, CARPENTERS, and BLIND MAKERS.
J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Public to his
IMPERIAL PATENT FLAX SASH-LINES
of which he always makes four qualities, and are strongly recommended that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.
They are now in use of all the Builders, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.
ESTABLISHED 1774.

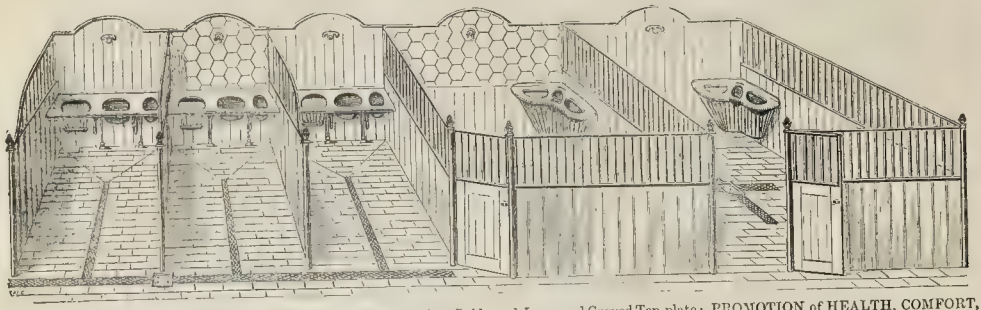
THE PRIZE MEDALS,

LONDON, 1851. PARIS, 1855. LONDON, 1862.

AWARDED TO

COTTAM & COMPANY,

No. 2, WINSLEY-STREET, LONDON, W.



FOR PROGRESSIVE AND GENERAL IMPROVEMENTS IN

STABLE FITTINGS AND HARNESS BRACKETS.

PATENTEES AND ORIGINAL INVENTORS OF

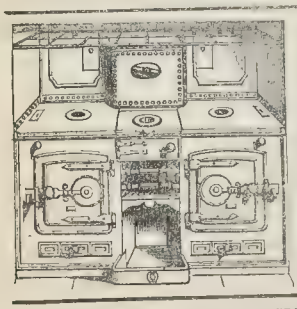
THE IMPROVED SYSTEM OF STABLE AND HARNESS FITTINGS,

PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS, AS WELL AS BY THE PRINCIPAL NOBILITY, GENTRY, AND HUNTING ESTABLISHMENTS IN THE KINGDOM.

SECURITY FROM ACCIDENT by the use of the Patent Halter Guide and Improved Curved Top-plate; PROMOTION of HEALTH, COMFORT, and CONDITION, by the cleanliness and power of resisting infection of the Mangers and Troughs; and also of the Patent Drop Cover, to curtail the quantity of water to be imbibed. ECONOMY in the USE of FOOD, from the improved formation of the Fittings, and by means of the Patent Portable Seed-box, are some of the peculiar recommendations of Cottam's Patent Componised, Enamelled, and Galvanized Iron Fittings for Stalls and Loose Boxes.

COTTAM'S PATENT COMBINED SADDLE and HARNESS BRACKETS; IMPROVED SURFACE GUTTER, WITH MOVEABLE SAFETY COVERS; Sanitary Traps, Cheap and Durable Corn-bins, and every Article requisite for the Stable and Harness-room.

IRON GATES, FENCING, and HURDLES MADE by MACHINERY.



COTTAM'S newly-invented REGISTERED NOISELESS MANGER SHACKLE and GUIDE FOR HALTER-STRAP, and IMPROVED VENTILATING HARNESS BRACKETS, are only to be obtained from the Inventors, and can be seen in use at their Manufactory.

COTTAM & CO. exhibit for inspection, at their Iron Works, 2, Winsley-street, W., an extensive range of full-sized Stalls, Loose Boxes, and Harness Rooms, the most complete that can be imagined.

ILLUSTRATED CATALOGUES and LITHOGRAPHS free, on application to COTTAM and CO. 2, WINSLEY STREET, Oxford-street, London, W.

CANNON IRON FOUNDRY 156, Goswell-street, St. Luke's.—JONES & BLAXTON, having made great additions to their STOCK of PATTERNS, beg to inform the Trade that they can now supply them with Plain and Ornamental Iron Columns, Girders, Railings, Gates, Iron Coping, Balconies, Window Guards, Verandahs, Ornamental Staircase Panels, Iron Staircases, Tomb Enclosures, Trellis Panelling, Lamp and other Brackets, Cantilevers, Newel Bars, Water-closet Work, Area Gratings, Fly and other Wheels, Wheel Plates, &c.

BAKERS' OVEN WORK, Forge Backs and Troughs, Rain water Pipes and Gutters, Sash Weights, Furnace Bars, Stoves, Ranges, &c. always in stock.

CAST-IRON PIPES, IRON-WORK FOR OVENS, &c.

CUNDY'S

PATENT BRICK OVEN WINDING CHECK SEMI-CLOSE KITCHEN RANGE.

This Range will be found very superior to the close Range now in use, inasmuch as it combines the cleanliness of a close kitchener with the perfect ventilation of an open range.

The fall-down bar will be found useful for broiling purposes when the fire is low.

The Ventilator in the Oven Chimney, and also the Register, can be kept open without diminishing the efficiency of the range, thereby entirely removing the great objection and discomfort of all other close ranges, namely, the sulphurous and excessive heat in the kitchen, and the smell of cooking all over the house.

The great advantage of a brick oven is, that it absorbs the steam given out by bread or meat in the process of baking; consequently the latter is totally free from the disagreeable flavour too evident in meat baked in an iron oven.

As the fire of this range can be diminished or enlarged at pleasure, it can (when not in use for roasting) be wound up within 6 inches of the oven, and still be used for baking, also for boiling upon the hob over the oven, thereby effecting a considerable saving of coals.

THIS RANGE,—ALSO CUNDY'S PATENT BRICK OVEN DOUBLE FALL-DOWN BAR KITCHEN RANGE, and CUNDY'S PATENT COTTAGER'S KITCHENER,—can be seen in operation at the Show Rooms of THE MANUFACTURER,

WILLIAM ADDIS,

WHOLESALE AND RETAIL IRONMONGER, AND STOVE, GRATE, AND RANGE MANUFACTURER,

6, 7, and 15, LEICESTER STREET, LEICESTER SQUARE,

Where Mr. CUNDY can be gratuitously consulted, personally, or by letter, relative to the cure of Smoky Chimneys.

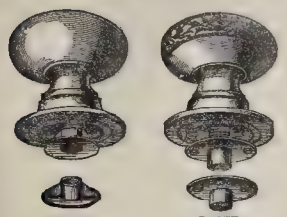
RANDAL STAP, Contractor,
No. 32, KING WILLIAM STREET, E.C.
Where numerous Drawings and Photographs may be seen.
N.B. The Iron Buildings manufactured by R. STAP are not fixtures on Leasehold Property.



SIMPLICITY, UTILITY, ECONOMY, AND DURABILITY.

THOMAS PUGH & CO.'S NEW PATENT ECONOMIC SELF-ADJUSTING MORTISE AND RIM LOCK FURNITURE.

BOND & SCAMMELL (late Thomas Pugh & Co.)

WHOLESALE IRONMONGERS,

13, KING STREET, SNOW HILL, LONDON.

NUT PLATE.

We invite particular attention to the PATENT LOCK FURNITURE, which we do not hesitate to say is the most perfect article now manufactured, great improvements having been recently made in it. It has been extensively used in public and private buildings, in Her Majesty's Pavilion and Camp at Aldershott—alone, many hundred sets without one single failure. It is applicable to all Locks and Latches, both rim and mortise, and effects a most secure fastening, without any screw in the neck of the knob. Perfect action guaranteed in both Locks and Furniture, if the Locks are of our own manufacture.

New rich designs in glass, china, brass, bronzed, gilt, carved woods, inlaid, &c. &c. or to any design

THIS FURNITURE MAY BE HAD WITH PLATES OR NUTS.

A most complete and extensive stock of every description of locks, latches, brass foundry, and ironmongery, required for buildings, of the best quality manufactured, at the lowest wholesale prices.

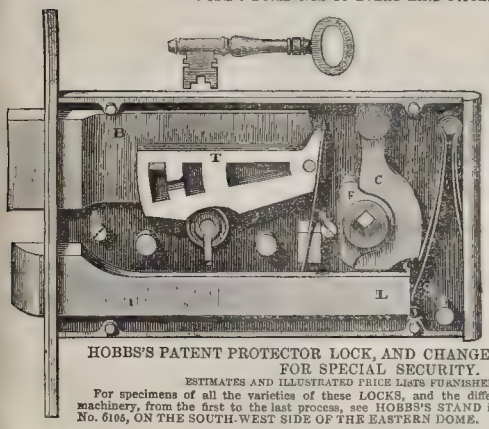
*** Illustrations and particulars sent upon application.

LAMBERT, BROTHERS,

THE ALPHA TUBE & FITTING WORKS,

WALSALL.

LONDON: THOMAS LAMBERT & SON, LAMBETH.



INTERNATIONAL EXHIBITION, 1862.—CLASS 31, LOCKS, &c. No. 6105.

HOBBS'S CELEBRATED MACHINE-MADE LEVER LOCKS,

Suited for all purposes, at Prices that silence competition.

SUITES OF LOCKS FOR MANSIONS, WAREHOUSES, AND OTHER LARGE STRUCTURES, WITH OR WITHOUT MASTER KEYS.

PUBLIC BUILDINGS OF EVERY KIND FITTED.

The parts in the Plate marked F and C show the form of Hobbs's Patent Frictionless Follower and Crank, by which a rolling instead of a rubbing motion is produced, thereby preventing friction.

S, s, shows the double spring, by which means the Latch is allowed to work independent of the Crank in shutting the door, thereby avoiding the necessity of slamming; at the same time sufficient strength is given by the Follower Spring to throw the heaviest knobs or handles.

HOBBS' PATENT FRICTIONLESS FOLLOWER, & DOUBLE SPRING FOUR-LEVER MORTISE LOCK, Price 8s.

FIREPROOF SAFES, IRON DOORS, CASH BOXES, &c.

HOBBS'S PATENT PROTECTOR LOCK, AND CHANGEABLE KEY BANK LOCK FOR SPECIAL SECURITY.

ESTIMATES AND ILLUSTRATED PRICE LISTS FURNISHED ON APPLICATION.

For specimens of all the varieties of these LOCKS, and the different stages of manufacture by machinery, from the first to the last process, see HOBBS'S STAND in the EXHIBITION, CLASS 13, No. 6105, ON THE SOUTH-WEST SIDE OF THE EASTERN DOME.

HOBBS, ASHLEY, & CO. 76, CHEAPSIDE, E.C.

B. BENSON'S WATCHES AND CLOCKS.

"Perfection of Mechanism."—*Morning Post.*

Watches and Clocks of every description, from the plainest to the highest quality of which the Art is at present capable.

BENSON'S ILLUSTRATED PAMPHLET (free by post for two stamps) ON WATCHES contains a short History of Watchmaking, with descriptions and prices. It advises upon the purchase of a Watch and enables those who live in the remotest Island, Indian, Colonial, Watch, Clock, India, or any part of the World, to select a Watch, and have it sent free and safe by post.

Watches.	Clocks.
Chronometer, Duplex, Lever, Horizontal, Vertical, Minute, Half-quarter, and Quarter Repeaters, Independent and Plain Centre Seconds, Keyless, Chronographs, Enamelled, Astronomical, and Reversible Watches.	Drawing-room, Dining room, Bed-room, Library, Hall, Staircase, Bracket, Carriage, Chime, Musical, Astronomical, Church, Turret, Stable, Railway, Post-office, Shop, Warehouse, Office, or Counting-house
FROM 200 Guineas TO £3. 3s. each.	FROM 1,000 Guineas TO £1. 1s. each.

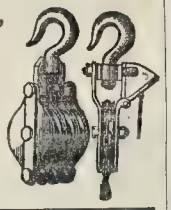
Clocks and Bronzes manufactured from High Art Designs by English, French, and Italian Artists of great celebrity.

ESTIMATES GIVEN FOR CHURCH AND TURRET CLOCKS.

OPINIONS OF THE LONDON PRESS UPON BENSON'S GREAT CLOCK AND WATCHES.

"As a sample of English clockwork on a large scale, the works of this are probably the finest finished that have ever been seen in this country. No chronometer could be fitted with more perfect or carefully-adjusted movements."—*Times*, June 1, 1852.
"A triumph of ingenuity."—*Telegraph*, March 31.
"The entire finish is alike beautiful."—*Daily News*, May 29.
"A more profound and exquisitely-finished piece of mechanism we have never seen."—*Standard.*

"The largest, and unmistakably the best finished clock in the Exhibition."—*Engineer*, Aug. 15, 1862.
"Some of them are of great beauty; and if the English watch-trade only follow up with the same spirit and success this first attempt to compete with foreigners in decorative watches, there seems to be no reason why we should not get the trade entirely into our own hands."—*Times*, June 23.



33 & 34, Ludgate-hill, London.—Established 1749.

EDINBURGH: ADAM & CHARLES BLACK. LONDON: SIMPKIN, MARSHALL, & CO.

IMPORTANT TO ARCHITECTS, ENGINEERS, BUILDERS, RAILWAY, AND OTHER COMPANIES.

VIEILLE MONTAGNE ROOFING ZINC.

Company's General Agency, 12, Manchester Buildings, Westminster.

Zinc properly laid has been proved by most extensive and long experience in France, Belgium, and Germany to be a most secure, durable, and economical covering, and is now preferred to all other materials for roofs. Its extreme lightness makes it most valuable for covering buildings requiring large spans with comparatively light framing. On a rough calculation it may be estimated that not less than 41,000,000 square feet is the average quantity of Roofing surface now annually covered in the above countries alone. Within the last few years persevering efforts have been made to introduce into England proper workmanship, in accordance with the principles which are observed on the Continent, and which alone can secure the sound and perfect construction of a Zinc roof. To aid in extending as much as possible the knowledge of these simple rules, models showing all the details are to be seen in the Architectural Exhibition in Conduit-street, and the following, selected out of a very great number of recently constructed roofs, are referred to as examples:—The Patent Granary, West-India Docks; Copenhagen Works, Limehouse; a private house in Holland Park; Homes for Poor Merchants' Clerks, Muswell-hill; a large Warehouse, 77, Thames-street; Ship roof, Sheerness Dockyard; the Victoria Station, Pimlico; the Stations in the Metropolitan Railway; the Stations of the Madras Railway Company (400,000 feet); the Warehouse of Messrs. Oakes, Brothers, & Co. Madras (20,000 feet); the Refreshment Rooms at the Exhibition; the Verandah of the Horticultural Society's Conservatory; Gloucester Railway Station; Messrs. Horniman & Co.'s Tea Warehouse, Wormwood-street; Messrs. Hoare & Co.'s Brewery, Smithfield; Cape Town and Wellington Railway (60,000 feet); Fifty new Dwelling Houses at Palace Gardens-terrace, Kensington; Twenty ditto, Inverness-terrace, Bayswater.

Plans, Estimates, and all useful information will be furnished, without charge, by applying to either of the Directing Architects.

JAMES EDMESTON, 5, Crown-court, Old Broad-street.
R. G. FISHER, 12, Manchester-buildings, Westminster.

N.B. No covering can be more economical, durable, and secure than Zinc when well laid, but good Zinc badly laid will spoil the roof, and, with a view still further to encourage good work, a special Discount will be allowed to all persons upon the Zinc used in roofs, when certified by either of the above Architects to be properly laid.

VOL. XXI.—No. 1048.

History of the Modern Styles of Architecture.

IN the early days of railroad engineering, durable decorative character in the buildings was aimed at rather more, perhaps, than it has been since discovery of the fact that traffic is subject to expansion entailing changes, not only in stations, but in bridges, and other substantial features of a line. The quality of design, however, was not always good; moreover, certain principles which had not obtained recognition from architects, had still less dawned on the perception of the other branch of the profession. In a well-known work, published in the early days,—one, to the general value of which, slight exception after all need be made, —there are designs for several kinds of structures, including entrances to tunnels; and, as alternatives, or for the same purpose and object, designs may be found whereof one is described as Gothic, or "castellated," another as Grecian, and a third Egyptian, and so on. Not far from the Edge-hill tunnel of the Liverpool and Manchester Railway, we have recollection of a "Moorish arch," as built, spanning a cutting; and the somewhat more satisfactory principle of treatment, as in one or two of the London and Birmingham railway tunnel-entrances, was exceptional to the practice of engineers. Books of designs by architects, indeed, were at that time characterized by the error against which we have long contended, that seen in the contemporaneous practice of a plurality of styles; whilst there were railway stations erected, as the Euston-square *propylon*, the aim in which seemed to have been only to produce an imitation. Neither in the buildings of this class, nor in the designs, was there existent, the *art* that is now yearned for, nor much that was symptomatic of perception and appreciation of its essentials and conditions. Many of the present race of architects have either abandoned this fickle and purposeless course, or are conscious that the healthful condition and future progress of architecture, are dependent upon the previous attainment of a certain unity, which, as regarded by those in after ages, can be comprehended in like manner as what we call *style*, and which, "true" and not "imitative," is favourable to art and art-appreciation, and in no degree repressive of the desired working of the requisite element in art, invention. Some of the race, however, still remain ready to adopt any disguise; whilst many recent productions of engineers, would-be architects, are evidence of the like instability, or a want of apprehension of the conditions and requirements of real architecture.

The engineering branch of the profession, by giving chief attention to an expression of the structural, and by emphasizing features in a work, whilst avoiding imitation of whatever style, might, even though not rising to the rank of artists, be regenerators of our art. In his "History of Modern Styles of Architecture,"* to which we have already devoted two articles,† Mr. Fergusson, under the head "Civil and Military Engineering," perceives the opportunity open to engineers, and gives them the credit of having expressed in many of their productions, what are some of the chief attributes of good architecture; whilst he regrets the tendency to fall deeper than they have fallen, into the practice of imitation, of which architects and the public taste are accused, deepening the channel of error in which so-called *architecture* is moving.

Leaving out of the question such kinds of work as embankments and roads, and the permanent way of railroads, there is no real line of demarcation between the two branches of the profession; and art should be the produce of one and the other. Alluding to tunnel-entrances and the like, Mr. Fergusson says, "a collection of these objects, classified as they belonged to the true or imitative styles of Art, would be as correct an illustration as could well be found, of the two principles of design prevalent in ancient and in modern times, and a fair test of their relative excellence." Unfortunately, he says, engineers generally do not appreciate the value of the principles on which, in many of their works, they have been unconsciously acting. Therefore, more especially on the Continent, there are Grecian Doric stations, and others which are Byzantine, or Gothic, or Pompeian, so designed merely to save thought and trouble.

Three classes of design in existing works, such as railway stations, are recognized by our author. The first he would call Engineering Architecture, the second Artists' Architecture, and the third Architects' Architecture. The King's-cross station, the roof of which is contrasted with the artistic architecture of that of Westminster Hall, is given as example of the first,—though it is the truthful and not the unornamented character of the former structure that the author approves of: the façade of the Strasbourg Railway Station in Paris is given as of the second; and that of the Newcastle Station, with "intended portico" (now in progress), of the third. As regards stations generally, he thinks it may safely be asserted that they are "good and satisfactory in the exact proportion in which it is difficult to name the style in which they are erected."

Before reverting to his views on the subject of style, we should mention that a subdivision of this concluding portion of his book, relates to what he characterizes as "Ferro-Vitreous Art." On the merits of the Exhibition building of 1851, his views are known, having been first published through the medium of the *Builder*. The building at Sydenham, in his opinion, possesses "three of the great elements of architectural design," greatness of dimension, truthfulness of design, and ornamental arrangements; whilst he allows that it is deficient in two others.

> "It has not a sufficient amount of decoration about its parts to take it entirely out of the category of first-class engineering, and to make it entirely an object of Fine Art. But its greatest defect is, that it wants solidity, and that appearance of permanence and durability indispensable to make it really architectural in the strict meaning of the word."

No doubt he is here considering chiefly the *apparent* solidity. Those who would pursue the question of the actual permanence and durability, may do well to read what has been said on that subject by Mr. Mallet in the "*Practical Mechanics' Journal* Record of the Exhibition of 1862," where with other points in the question, the destruction of one of the wings of the Sydenham Crystal Palace, by a gale of wind, is referred to. Mr. Fergusson however admits it is questionable whether the requisite strength could be imparted to any building wholly composed of glass and iron. He advises the introduction of a third material, as coloured brick and terra-cotta. He thinks that stone would be "too solid and too uniform," and that the designers of the Paris Palais de l'Industrie seem to have thought so when they avoided all attempt "to amalgamate the two elements at their command," and hid their Crystal Palace in an envelope of masonry; whereas in the new building at Auteuil (which we illustrated lately), stone is used for accentuation, but not concealment. Brick, he says, "would probably have been better" in this latter case; whilst at Sydenham, if the whole of the lower story in the garden front up to the floor-line, the angles of all the transepts, and to a certain extent the screen-walls, had been of brickwork, the design would have been improved. The "real difficulty in adopting such a mode of treatment," he says, is, besides "skill and judgment," the "immense amount of thought" required to work out details, thought which he perceives throughout his book, architects will not, or at least are not allowed to, give. But if the work were well done, he conceives it would be equivalent to invention of a new style, which would be applicable for many purposes, though not all; and that if the development were to take place in this "one of the few branches of the art on which a future of progress seems to be dawning," men would soon perceive that Classic columns and Gothic arches are hurtful as well as useless, and it would come to be believed that men of the nineteenth century could be constructors and artists as much as their forefathers in the thirteenth. Then the battle would be gained; and architecture becoming a truthful art, would recover the place "from which she has been banished for centuries."

We must say that very much will indeed have to be done before the "Ferro-Vitreous" manner of building can take high rank as art. The view in the nave of the Sydenham structure is one of the finest effects of perspective that can be found; but the external design of the building, with its tiresome columns and openings, repeated of the same dimensions, and everywhere telling of labour-saving and money-saving; the square-box like appearance of the aisles without apparent roofs; the similar character of the stunted towers at the intersections of transepts with the nave, and which would have been improved by domes as suggested by Sir Charles Barry; the general appearance of flatness of the iron and glass casing, which the bolder masses do not succeed in correcting; and the lack of harmony between the building and the foreground,—besides the complete want of design in the detached chimney-towers, and of grouping with the main buildings,—show that "Ferro-Vitreous" construction is far from ranking as the *art* that is hoped for. The Palais de l'Industrie, charming in its details of the masonry, was not a step; and we apprehend the building at Auteuil will rather exemplify the disadvantages, as regards art, of the method of building, than register any important advance.

Belonging to "Military Engineering" our author shows that there are structures of many kinds,—exclusive of bastions, not more than one in a hundred of which is ever fired at,—which would be capable of artistic treatment. He gives one example, a granary at New Georgiesk or Modlin, where the Bug and Vistula meet. Standing in the centre of an important fortress, it was necessary to fortify it. Casemates on the lower floor, a projecting gallery above, and a bomb-proof roof, not one feature that can be called inappropriate, and an elegant style, go to form out of the granary of a fortress a building of considerable architectural merit, and in the case of any building in the world, a similar result might be obtained with the same amount of care and pains. This building is 550 feet long, by 100 feet high in the centre. We give (see next page) an elevation of the central compartment, and a diagram showing the façade, from Mr. Fergusson's book.

Coming back to the subject of style, we read in a concluding chapter of the book:—

> "It does not require a man or set of men, as some have supposed, to invent a new style; the great want now is self-control and self-negation. What we require is that architects shall have the moral courage to refrain from borrowing, and be content to think, to work, and to improve bit by bit what they have got. If some artistic Chancellor of the Exchequer would only lay a heavy tax on every Classic column erected after this date, and assess equally every mullioned window or every Gothic pinnacle employed in future buildings, we should soon arrive at a better state of things.
>
> "The demand however must arise with the public and cannot come from the profession."

* John Murray, Albemarle-street. 1862.

Central Compartment of the Granary at Modlin.

We so far agree with this, that we could readily point to numerous articles in these pages, especially those reviewing Exhibitions, in which we have counselled the "bit by bit" progress, and the practice of one general style. Novelty, we have written, is an essential in every work that would aim to present itself as an art-work; without this attribute, art is not: but mere novelty is not art: any one can with ease invent something that has not been seen before, or produce something with which the public eye has not become familiar in an original. We have shown that, far from the public being right in demanding particular styles as to be observed,—and attended with whatever inconvenience to the writers of newspaper paragraphs, who can now so easily describe a new church as in the style of the thirteenth century,—advanced or real art, at any time, must necessarily be such as the contemporary resources of nomenclature and language would not suffice to present an account of. It is here that is exemplified the value that such modes of representation as drawing and photography, have inherently, as compared with writing or speech, and here that we think Mr. Fergusson's demonstration of an identity as Phonetic Arts, between Writing and Painting, is defective. Resuming, it may be safely asserted that when a tolerably complete and accurate idea of the features and character of a new building can be given without aid of drawings, such building must be below the standard of art which was that of the "True Styles," and the standard which alone, we should set up.

Although the passage we have quoted from the work, is evidence to us that there are few points on which we are not really in common with Mr. Fergusson, we think his wording should have been somewhat different for the public understanding; moreover, seeing the necessity of both thought and an accumulation of it, we are not sure that it would be judicious or obligatory for architects to place themselves in the position of the builders of cromlechs and circles of stones. The brilliant picture of the last few centuries of art-thought, which our author has presented, —the "History" of the *imitative styles* themselves, which he could not write without finding *art* to appreciate, whilst bringing as he has, a capacity of appreciation such as in the case of many of the chief buildings described, had not before been shown,—the details of this picture, and the tonings-down of general assertion,—would show that it is not meant by him that anything which might be a resource should be sacrificed.

Where he says of a *true style*, if we are to have it, that it will not be Gothic, he gives us the opportunity of saying, the principle to be inculcated upon architects, after production of the beautiful, is only that of *avoidance* of any character of art or building which is one not of the country and time. There are many things, however, which are both at home in one period and place, and equally so over a wider range. If mullions interfere with the uses of a window: if they give the idea of a building erected in the Middle Ages rather than in our day,—an idea to Middle Ages rather than in our day,—an idea to which even when accepted by the proprietor or resident, every article of furniture as commonly procurable enters itself in protest and makes the taste a puerility,—banish the mullions, as architects who affect the Gothic character of design are now doing with advantage in some respects, but with something of the effect of the old "carpenter's Gothic" in others. Would a portico obstruct light to windows, have no portico; but don't lay a tax upon a feature which may be sometimes useful whilst beautiful and expressive. Either mullions, or orders, *can* be dispensed with; but we would have something corresponding to all such features *available* in any style of architecture that may be that of the future. In the style of Francis I., a valuable one for lessons, regular mullions are used with good effect, as in the House of Agnes Sorrel at Orleans, illustrated by our author, and transferred to our pages (see page 171), and in Elizabethan architecture, and such Jacobean as the house at Longleat, where they are evidently necessary to counteract what would otherwise have had the effect of a much too wide aperture. Something corresponding with them was common in every style; indeed they are the features of the so-called Venetian window, as of the real Venetian, and the Florentine; and are traceable in the French casement. The point is not to *forbid* the use of anything; but to inculcate the necessity of a whole design being not inconsistent with use and strength of the building, —and the use, modern use; the combination of as much decorative form and ornament as may be consistent with the expression of use, and procurable from the study of nature and works of all styles; and lastly, the addition of as much novelty as may be possible without going decidedly below a standard which is constituted in the average of the best works previously produced.

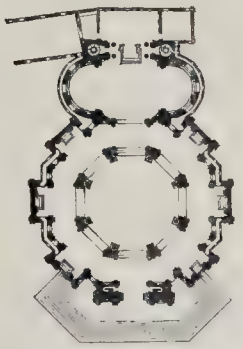
To justify the exclusion of even the "orders,"—just now suffering the misfortune common to things with a bad name,—Mr. Fergusson consistently should exclude much else that his thorough appreciation of art does not withhold approval of even in the "imitative styles." His generous perception of what there is of admirable in Palladio's work; even in the architecture of the Russian capital; in Munich, Berlin, and Paris; and in the granary at Modlin, the architect of which was evidently indebted to Florentine architecture, is not the less accurate that it leaves the question of the future and some use of these and all other examples and models, exactly where it was. We indeed do not believe in any "going back" as consistent with art. We should not believe in it, even in the case of to the Renaissance Italian which our author has indicated as "by no means worked out or perfected," and as having hardly yet had a fair trial of its merits. The question is,—Where is it that we are? We can advance from no other point than that; though starting thence, we can take lessons and suggestions of forms, and perhaps even derive features, from all styles. If we mistake not, few have better shown that such should be the course, than Mr. Fergusson himself.

But, as to the present value of some part of what our author calls the Imitative Styles. Speaking of the villa of Pope Julius, outside the Flaminian Gate, he observes that it "displays those peculiarities of design which produced such an effect throughout Europe that every detail of this building may be found repeated over and over again on this side the Alps." And he adds that though perhaps there is not much grandeur or any very remarkable feature about the design, "there is an entire absence of bad taste or of any false principles, which in that age is great praise." Surely, such exceptions to denunciation of the sixteenth-century Italian as imitative, go for something in the argument of our ability to do as much with Vignola, and with the materials he used, as he effected, especially now that repetition "over and over again" is condemned on every side.

One of the arrangements to which Mr. Fergusson objects in the later Italian, is that of pilasters which run through a height of several stories, or even two. Wherever such arrangement is at variance with demonstration of the fact of several stories, the objection has reason; and we might quote the façade of the Royal Institution in Albemarle-street as an example, added, no doubt, to others in London, of the sort of arrangement that should be avoided. But, provided horizontal lines make the actual division prominent, as they may where say two stories only are included in the order, condemnation of all designs of the class is too rigorous, and would tend to deprive us of one resource for grouping which may be of value where number of stories is great, or amounting to six or more. Such a number is scarcely ever very effective unless the composition divide itself into three, or at most four parts in the height, including something in the place of balustrade or attic. This may be seen by the greater portion of the recent and many-storied architecture of Paris, in which detail is everything, and grouping, except what results from the central and prominent feature of the entrance, is nowhere. Speaking of the Museum in the Capitol at Rome, by Michelangelo, Mr. Fergusson says that the Corinthian pilasters running through two stories "are used here with a vigour which goes far to redeem the impropriety of their introduction." Few architects, looking at the building itself, will consider the example as favourable to the author's general principle for such features as pilasters; and if the orders are elected to be used in a many-storied front, it may be well (although Mr. Fergusson would seem to think otherwise) to avoid a multitude of them superimposed; because, even with a *cornicione* proportioned to the whole height of the building, it is difficult to avoid an equality in the heights which is hardly reconcileable with good proportion, and the appearance imputed to such arrangement, that the decorative features are "stuck on." The object is that the perpendicular lines shall not be so prominent and so suggestive of temple-architecture, as to prevail over the testimony in favour of the existence of more than one story, which is given by the appearance of more than one tier of windows. The façade, with three-quarter columns, of the Royal Institution, and even the flank elevations of St. Martin's Church, with pilasters, tried by such a canon as is here suggested, may be condemned. But parts of Somerset House would show that either columns or pilasters including the height of two stories, can be used so that there shall be no want of harmony with the structural arrangement, whilst the decorative effect shall gain something. One of the best examples we know, of the use that may be made of perpendicular lines where there are several stories, is the front of the Imperial Fire and Life Office in Pall-mall, by Sir Charles Barry.

Objection to such use as he condemns, of an order, arises mainly in the uncouth detail of particular examples that he mentions, as the Corinthian of Vanbrugh's works. The Corinthian capital, as he has well shown, should not be used at all for pilasters on the large scale of those of St. Peter's at Rome; the Greeks at least, would have used, as indeed was their practice, capitals wholly different to those of columns. But the fault as in the case of St. Martin's-in-the-Fields, is in the treatment of the windows, and the omission of proper hori-

zontal mouldings; and that is sufficiently shown by the Roman work above mentioned.



Mr. Fergusson, in the first chapter of the Italian division of his volume, traces the chief features of the progress of Ecclesiastical Architecture in Italy from the time of Brunelleschi, who returned from Rome to Florence in 1420, to the commencement of St. Peter's at Rome. He notes in Brunelleschi's churches, the block of entablature over a column, for the springing of arches, as "perhaps the most fatal gift of Classic Art to modern times," since, he says (we should hardly think correctly), "nine-tenths of the difficulties and clumsinesses of the revived art are owing to the introduction of this feature." The architects of the fifth and sixth centuries had allowed the arch to spring direct from the pier or pillar. He says,—"No single feature can more clearly mark the dawn of copying, to the exclusion of thought," than the "reproduction," as by Brunelleschi, of this feature. In a later part of his work, where he had been speaking of St. Martin's in the Fields, he says,—

"Had the architects only had the sense to turn the fragment topsy-turvy, it would then have been constructively correct. It would in fact have become the Moorish horse-shoe arch, and with a very slight modification of detail might have lost much of its offensive character, while it would have ranged as well with anything on the wall."

But it is allowed, any "feature invented for the place" would have been best.

Of the Church of St. Andrea at Mantua, by Alberti, Mr. Fergusson says that although the ornaments are secular rather than ecclesiastical, "there is probably no church in Italy, so entirely satisfactory as this." After Alberti's churches, he comes to those of Bramante. Of the church at Lodi, the plan of which (see page 171, where will be also found a section) may be described as a square with four apses, the apses being covered by semi-domes, whilst the four arches of the centre area carry a dome with tambour, on pendentives, he remarks that although 150 feet as the dimensions of width on plan, and 125 feet in height would have been better than the 125 feet and 150 which exist, the building has a merit in truthfulness, wherein it surpasses any Gothic building we are acquainted with, since there is no false roof or false construction of any sort. Bramante's Church of Santa Maria delle Grazie, Milan, is suggestive, like the last. The "dome," or polygonal crowning feature corresponding thereto, is carried by a square mass which rises from the ground. The opposite defective arrangement, where the dome rises from the roof of the church, is much too common, as our author shows. It is the capital blunder in St. Peter's at Rome; and it must be considered a defect of the design for St. Paul's which is shown in the model, though the different plan of the existing building allows more of the appearance of a dome rising from the ground. The last of the churches before St. Peter's which the author illustrates, is the Certosa, Pavia; but he ought equally to have mentioned San Zaccaria, Venice, placed under the head "Basilican Churches" in a later chapter. Its façade was completed about 1515, or when little more than Bramante's commencement of St. Peter's had been made. The chapter on St. Peter's, which includes illustrations of the principal designs, is an excellent historic sketch and critical review of the "largest" and "most magnificent temple ever raised by Christians in honour of their religion," which Mr. Fergusson says "was only prevented from being the most beautiful by the inherent vices of the school in which it was designed," and the study of which affords now "one of the saddest but most instructive examples in the whole history of architecture." The "world's greatest opportunity" was thrown away, because the building "happened to be undertaken at a time when architecture was in a state of transition, and when painters and amateurs were allowed to try experiments in an art of which they had not acquired the simplest rudiments, and did not comprehend the most elementary principles." Other chapters are given to "Churches subsequent to St. Peter's," "Domical Churches," "Basilican Churches—Exteriors," and "Basilican Churches—Interiors." He concludes, that on the whole, the Italians may not unjustly be regarded as having failed, after four centuries of labour, to produce a satisfactory style of ecclesiastical architecture.

Taking however, the whole style as we find it in examples scattered over Europe, it would be premature to say that we are thrown back to the lessons that may be got exclusively from Mediæval church-building. It is clear to us, that in church architecture for the Protestant ritual, we shall ultimately come to different arrangements of plan than those of which the chief features are columns obstructing the view. Enter a Continental church of the average class, and the use of aisles is obvious: they are passages, of scarcely more than necessary width, between the line of chapels on one side, and the space on the other, in the nave, which has the seats and is enclosed. But, for the Mediæval plan, in the majority of Protestant churches, which must be of such small size that the aisles are wanted for seats, we doubt whether there is much argument beyond that arising in association and tradition. In St. Stephen's, Walbrook, where even there are columns, it is remarkable how small is the quantity of obstruction to the view from any part of the building. However this question be regarded, we may say that Mr. Fergusson's book contains plans which will show many different arrangements. There are those of the Italian domical churches which include the church at Lodi, as well as the church Santa Maria delle Salute, at Venice, relative to which a happy

Plan of the Church delle Salute, at Venice. Scale 100 feet to 1 inch.

suggestion is offered for an improvement in the plan, making what is now the choir the entrance. Showing that there is no prejudice in the Roman Catholic priesthood for one form of plan, we have besides the circular and other churches mentioned, those of Spain, wherein the choir is placed in the nave, and sometimes as in the church of the Escurial, in the position with us at one time deemed best, that of an end gallery. Mr. Fergusson has scarcely touched upon the real cause of an unsatisfactory state of our *church*-architecture, want of agreement amongst the clergy in matters of ritual, and consequent absence of understanding of what are the requirements of plan. In his chapter on the German Renaissance, however, we find two or three forms of churches which are not without importance. The first of these is the church of St. Michael, Munich. It is ceiled by a great vault, and has no columns to interfere with the view. Mr. Fergusson says:—

"The real interest of this design consists in its illustrating, as clearly as any that can be quoted, what the early Renaissance architects were really aiming at in the changes they were introducing. They felt—whether rightly or wrongly may be questioned—that the pillars with which the Gothic architects crowded their naves not only occupied a great deal of useful space, but interrupted the view of the ceremonial at the altar, and interfered with the grandeur of the processions."

The Roman Thermæ showed them how vast spaces might be vaulted; they sought to emulate the greatness rather than the forms of the Roman structures; and had they adhered to this, we might perhaps, our author says, have hardly regretted the change. It was the second inspiration, the rage for classical details, consummated in the time of Palladio and his school, in the reproduction of plans and forms as the principal object of a design, that really ruined the art.

Another very noteworthy structure, though, perhaps not for details, is the Liebfrauen Kirche, Dresden (shown by a plan and view, page 171). A square church, 140 feet each way, exclusive of the apse, it has a dome 75 feet in diameter resting on eight piers. Its "great peculiarity" is "the perfect truthfulness" of the construction.

"Internally and externally it is wholly of stone; not only the dome, but the whole of the roof is shown, and all is constructively true—a merit possessed by no other Mediæval or modern church. The shape, too, of the dome is sufficiently graceful externally; and, with its four subordinate turrets, forms the most pleasing object in every view of the city."

The internal proportions, it is true, are not the best, from the height relatively to the other dimensions; and the fittings are like those of a theatre. But externally, notwithstanding the details and the time in which the church was built (1726—1745) "it is the most pleasing and suggestive of German churches, and with slight modifications it might be made very beautiful," and Mr. Fergusson adds:—

"Like the Jesuits' Church at Munich, it was an effort to do something that neither the Roman nor Gothic architects had achieved, and was only unsuccessful from its being a first attempt. Those who are aware how many hundreds—it may be said thousands—of repetitions were necessary before a really satisfactory Gothic church was built, should not feel surprised that this first essay to realize a novel form should not be quite successful; but if a second, or third, or fourth had been demanded, the last, or at least the twentieth, might have been all that could be desired. But it never was repeated. The next church was by a different architect, in a different style. The principle died with its author, as is the case with most modern designs; and all, consequently, fail in producing the effect that might easily have been attained by a more persistent system."

After a review of the secular architecture of Florence, Venice, Rome, Vicenza, Genoa, Mantua, Milan, Turin, and Naples, and in which the features and merits of each are described and appreciated, he finds that the Italians have not reached the second stage of the Renaissance distinguished by him as the Revival. They have not made such use as we have, of unmeaning porticos: the Greek Revival has not affected them; and they have not attempted such a thing as a Madeleine or a Walhalla. If they do not, by one of those caprices that are too common in art, take to copying something French or English, no nation has so fine a chance, Mr. Fergusson thinks, of attaining perfection in architectural art.

The whole of that division of Mr. Fergusson's book which treats of Spain, is full of interesting matter. It includes an accurate appreciation of that remarkable monument the Escurial, to which in the following division is added a notice of the Palace at Mafra, in Portugal, a building of the same class, palace and monastery on a vast scale of plan, with the dome and steeples of the church towering above all and binding the composition together. Mafra, the largest, is the finest composition of the two. It seems to be strangely unknown to architects.

Interesting features in the ecclesiastical architecture of Spain are the steeples, which are peculiar to the country as compared with Italy and France. One of them, that of the Seo, Zaragoza, is given, page 171. In speaking of the secular architecture of Spanish Renaissance, Mr. Fergusson notices the cloistered courts, and amongst details, the bracket-capital,—still a desideratum in architecture, but which the Spanish architects "were in a fair way of supplying when the Classical School of Herrera put a stop to progress in this or any other direction."

The account of the church of the Pantheon, Paris, in the division of the volume which treats of France, is another of the author's succinct and accurate reviews of the points and merits of one of the reputed grand monumental works of Europe. Similar appreciation, which cannot fail to be of value to readers of every class, characterizes what he has to say of Versailles (his plan of it however is incomplete, and therefore inaccurate); of St. Paul's Cathedral; St. George's Hall, Liverpool; the Houses of Parliament; the works in Munich and Berlin, and St. Isaac's Church, St. Petersburg. As to the last-mentioned building, he says,—"he must be a greater genius than the world has yet seen, whose passing thoughts are worth one thousandth part of the money that has been spent on them here," the result being that the Chevalier de Montferrand could "lay claim to the unenviable distinction of having been the author of the greatest architectural failure in modern times."

We are unable to follow Mr. Fergusson into Asia and America; but our readers will find much new and valuable matter in the divisions relating to those quarters of the globe. In the division on theatres, though it is valuable for what is not historical or descriptive, he chiefly states the difficulties of the case. He however makes a suggestion as to throwing back the ends next the stage, of each tier of boxes going upwards, till the top tier would be a semicircle,—so as to allow the occupants of the upper tiers, all to sit more directly facing the stage; but we do not see how construction would become much easier. For the improvement of music-halls of great size, he looks to lessons which may be got from experience at the Crystal Palace.

Though it would be scarcely just to regard all the existing schools of Anglo-Italian architects as under the belief that the "orders" are the only available "means of enriching a design,"—sup-

posing our author so to appreciate his fellows,—we should agree with him that the devices, appliances, and qualities, which he refers to as alternatives in composition, are to be found "more frequently" in Paris "than in any other city of modern Europe." He accurately says:—

"The great charm, however, is, that in Paris there are not three or four such designs as those quoted above, but three or four hundred—many, it must be confessed, of very questionable taste, and where the ornaments are neither elegant in themselves nor properly applied; but these are certainly the exceptions, and even they tend to produce a variety and richness of effect in the new boulevards and streets, which renders Paris the richest and most picturesque-looking city of modern Europe. It is the only town, in fact, that affords an answer to the reproach of the Mediævalists, who, when they single out the dull monotony of Regent's Park terraces or Edinburgh rows need only turn to the new Rue Rivoli, or the Boulevard Sebastopol, to see that the dulness of which they complain is not in the style, but in the architects, and that it must be as easy for us, if we had the wit to do so, to make our towns as picturesque, and far more beautiful than they were when filled with the rude and inconvenient dwellings of our forefathers."

He goes on however to say:—

"The best period of this peculiar style of Domestic architecture was the latter part of the reign of Louis Philippe, or the first two or three years of the second empire. Since that time, taste in these matters has declined with wonderful rapidity in Paris."

Here we think him in error. The three elevations which he gives, are taken from Calliat's "Parallèle," and we suspect from the first edition, which was published some years before the best works of the Champs Elysées, and what are now the chief quarters of the north and west, were built, and prior to the completion even of the Boulevard de Sebastopol. We should quite agree with him in thinking that designs have suffered by the pressure of the demand upon the architects, and said as much in 1861; but although some poor designs were carried into effect in the Boulevard de Strasbourg and the Rue de Rivoli, and others have been produced since, including now the Grand Hôtel de Paris, Boulevard des Capucines; and although flatness and deficiency of grouping are yet characteristics; the most recent works manifest no falling off in those qualities which our author has discovered in so many of their predecessors. This, if not shown in later books by Calliat, than that named, is shown by M. César Daly, whose work, giving the most recent buildings, illustrates each subject with a completeness to which the faint outlines of Calliat's elevations have no pretension. We cannot, however, more than our author, say much in favour of the present French ecclesiastical art.

We will not conclude this present reference to Mr. Fergusson's volume without expressing our thanks to him for what cannot but be an aid to architectural progression.

THE ENCLOSURE OF THE CROWN LANDS IN THE NEIGHBOURHOOD OF THE METROPOLIS.

DURING the ten years, from 1851 to 1861, the population of the metropolis has increased 18 per cent., and in all directions the houses and the population are stretching into the country. Before another half-century has passed, if the same increase be continued, the suburbs of the metropolis will have grown to an extent which it is difficult now to imagine.

Year after year an immense space is being covered with streets and houses. Hyde Park, the Regent's Park, and Primrose-hill, have become surrounded by dwellings which contain a large population; and soon Hampstead Heath, if it should fortunately remain uncovered, will be in a position similar to the spots to which we have referred. In Islington the green fields are rapidly vanishing, and in the east of London the builders are equally busy; so that in that direction, by means of new streets on the Isle of Dogs and Cubitt Town, Whitechapel will be joined to Blackwall. In many other parts similar operations are going forward; and each year the value of clear open spaces for the recreation of the multitude will become greater, not only in the heart but also in the outskirts of the metropolis.

When we glance at all the changes which have taken place in this vast capital, even since the beginning of the present century, the great benefit which is derived from the open breathing spaces which have been wisely kept is apparent; for, independent of the advantages which the parks offer as places of exercise and recreation, the public health is improved to a considerable extent by the air which comes ventilating from them into the narrow streets and courts of confined neighbourhoods. These benefits have been conferred by generations which have passed away. Our appreciation of the great advantage of these provisions ought to make us in our own day careful for the health and recreation of those who are to succeed us; and in order to perform this duty properly, we must look ahead, and not only preserve those rights in connexion with the common and Crown lands which we at present possess, but also secure other necessary open spaces which can be reserved at a comparatively moderate cost for the future use of the public.

The plan of metropolitan railways, which is being rapidly carried forward, will effect important changes; and amongst other benefits will afford facilities for the pent-up Londoners to visit pleasant places near the bustling and smoky town; and in connexion with this important subject, the fact should not be lost sight of that it is probable that before the close of the present century we shall have upwards of four millions of inhabitants in the metropolitan districts.

London, to a greater extent than most other capitals, is immediately surrounded by places of much beauty. The Thames, eastward, has its charms and interest; and westward there are Richmond, Hampton Court, and further away Windsor, &c., &c. There are many other places which are pleasant to behold; but few of those spots which can be easily reached by numbers of Londoners are more picturesque and suitable for recreation than Epping Forest,—a district to which we have before directed attention in the *Builder*. At that time we mentioned the encroachments which were constantly going forward there and in the neighbouring forest; and expressed a fear that, in consequence of the carelessness of that branch of the Government which had the care of the extensive Crown lands, the right of the public to rove there was in danger of being lost altogether.

To the dwellers of the eastern and northern districts of the metropolis, Epping Forest will become yearly of more importance, and soon there will be a cheap and ready means of conveyance from Clerkenwell and other parts, which will communicate with the North London and Loughton line: many thousands even now go to the forest by excursion trains, independently of the large numbers who travel by the ordinary trains and the road.

Taking all the circumstances into consideration, it seems most unwise and very wrong to dispose of any public rights, or to aid in the enclosure of these lands, and part with privileges which have been enjoyed for a period of about 800 years; and yet we find it reported by Mr. Peacock in the House of Commons, that large tracts have been parted with for a very trifling sum. This gentleman, who is deserving of thanks for having brought this matter under the notice of Parliament, tells us that he had moved for a return with respect to Hainault and Epping Forests, but that the Commissioners had been very chary of their information; but he gathered from their return that the Crown had disposed of its rights in these forests for a most inadequate price. He found that in August, 1856, the Crown rights had been sold over 434 acres for 1,891*l.* [this is at the rate of a little more than 4*d.* per acre]: on the 25th November, 1858, the Crown rights over 695 acres had been sold for 3,349*l.*; and in June, 1860, the Crown interest in 1,377 acres was disposed of for 5,468*l.*

Mr. Peacock estimates the extent of forest land here at about 10,000 acres; and it is sufficient to cause alarm for the remainder when we find that in such a short space of time the large extent of 2,508 acres has been disposed of. These transactions, in which the public are so much interested, have been privately negotiated; and we do not know what other sales may be in contemplation. We are glad, therefore, that Mr. Peacock has carried a motion, by a large majority, "that an humble address be presented to her Majesty, praying that her Majesty will be graciously pleased to give directions that no sales, to facilitate inclosures, be made of Crown lands or Crown forestal rights, within fifteen miles of the metropolis.

Mr. F. Peel, on the part of the Government, explained that the Crown did not possess any part of the soil of the Forest: that belonged entirely to the lords of the manor and their grantees. The only right the Crown ever possessed was a forest-right—a right to range and feed deer over the lands. The right was of no value to the Crown for revenue, for it would not be possible to make a deer-forest of Epping without the greatest inconvenience to the owners of the soil and to the general public. Sir C. Grey also made some remarks which were very little to the point, for it is clear that the maintenance of the rights which the Crown possesses would serve to keep this space open for the free use of the public. If, however, either now or at a future time, the rights in the soil should require compensation, the matter ought to be carefully taken into account and fairly settled.

There is no doubt that besides the wholesale disposal there has been a considerable encroachment in other directions; and, as we before stated, little huts have given place to substantial buildings; and, by a persevering process, the enclosed parts of the surrounding ground have grown to a wonderful extent.

Mr. Locke expressed a doubt of the rightful tenure of property acquired in this way, and suggested that these squatters might be liable to removal. The Chancellor of the Exchequer thought that it was no doubt important that the recreations of the people should be considered; but it was quite another question to propose, by resolution of the House and by action of the Crown, to part with no forestal rights whatever. To this Mr. Henley replied, that if Mr. Peacock's proposal was likely to operate as the Chancellor of the Exchequer had supposed, he would not readily support it; but all that he understood by the motion was, that no forestal rights were to be surrendered without the consent of the Crown. The consequence of this would be that, if the case proposed were a proper case for enclosure, and one that could be defended in that House by the advisers of the Crown, the enclosure would seem proper, and the Crown would get its full value, which would be turned into money. There would then be security that no dealing with those lands would take place without consent of the Crown and the responsibility of the Crown's advisers. He should therefore support the motion.

We have no doubt that, in connexion with these forest lands, the motion which Mr. Peacock has carried will have a beneficial effect; and that we shall have no more of this forest disposed of at any price. As years roll on the value of this open space will be so great that it will not be estimated by pounds, shillings, and pence. In connexion with the subject, the rights of the lords of the manor must be fairly and justly respected; but, at the same time, it must not be forgotten that to the Government are entrusted the interests of the multitude; and that they should strenuously cling to those possessions on which to a certain extent even at present,—and it will be far more so hereafter,—the health and pleasure of large multitudes will depend.

In making these observations, it must not be supposed that we advocate the preservation of desert wastes, or wish to stop the progress of the cultivation of tracts of land in certain quarters when they may add to the extent of the production of human food; but in great cities,—not only in London, but in Manchester and other large places,—the provision of breathing spaces, where men, women, and children may exercise their limbs, and inhale pure air, is as necessary for the preservation of health and life as daily food.

NEW THEATRE ROYAL, BATH.

OUR readers will recollect that the old Theatre Royal, Bath, was burnt to the ground on April 18th, 1862; and that designs for a new theatre being advertised for, this call was responded to by several architects. The choice eventually fell on one by Mr. C. J. Phipps, whose design, with motto, "A Midsummer Night's Dream," has been carried into execution.

The workmen first began operations, such as clearing the ground of rubbish, &c., the first week in October, 1862, and the theatre is now finished.

The frontage in Beaufort-square remains intact, that part being devoted formerly to wardrobe and dressing-rooms outside the main walls of the theatre proper; and being of good stone, well and solidly built, was little injured. The theatre itself, including auditorium and stage, stands on an area of ground 117 feet long by 55 feet wide, surrounded by box corridors, staircases, scene-rooms, workshops, and dressing-rooms, forming a block of building averaging 190 feet by 128 feet. The theatre is approached by six distinct entrances, thereby affording ample means of ingress and egress.

The box entrance and *porte cochère* are in the Sawclose, with an elliptical vestibule (on one side of which is the box-office); and a straight corridor leads past the money-taker, by a short flight of steps, 7 feet wide, at once to the dress-circle corridor. The staircase to the upper-boxes, of stone, 6 feet 6 inches wide, branches off to the right, immediately after passing the money-taker; and at the foot of this staircase is a corridor, 8 feet

wide, leading to another entrance in Beaufort-square, for wheelchairs, serving also as a second exit way from the upper boxes. The pit entrance is in Beaufort-square, about 3 feet below the level of the street, with an inclined way.

The pit will thus have two exit corridors, almost immediately opposite the doors into the pit itself, which are placed on either side of the house, adjacent to the orchestra. There is a stage-entrance in St. John's-place; the manager having a separate one in the Beaufort-square or pit side.

The plan of the house is totally different from that of the old theatre. The diameter of the circle is 36 feet, with a depth of 46 feet from the proscenium wall to the back of the pit, or front line of the box tiers. The diameter diminishes to 33 feet, in a straight line to the proscenium pillars (28 feet wide), opening by a convex curve to 35 feet, in a line parallel to the diameter; the space between the pillars at this part and the proscenium opening being devoted to private boxes, which are terminated by carved capitals at the level of the gallery front, third tier. An arch spans the opening of the same curve and depth as the private boxes. The ceiling takes the exact line of the box fronts, meeting the outer edge of the proscenium arch, and is 36 feet diameter, measured inside the cove. The stage advances about 6 feet into the house from the curtain line. The orchestra occupies the usual position, dividing the stage from the pit, the floor being 4 feet 4 inches in depth from the front part of stage. The floor of the first pit seat is 9 inches above this, rising at an incline of seven-eighths of an inch to a foot to the front of the dress-circle tier, the floor there being 6 feet 6 inches to the top of the box front. The dress-circle has a depth of 18 feet in centre, with seven rows of seats, gradually diminishing to two rows only at the sides. The angles from the stage are very sharp.

This tier is approached by three wide doorways from the back corridor, and two on either side, the passages being 3 feet 6 inches wide.

The circular corridor is paved with stone, and is 7 feet 6 inches wide: from it opens a spacious saloon, with cloak and retiring rooms for both ladies and gentlemen; also treasury, royal room, and manager's room. The side passages in all the tiers are inclined as you proceed towards the stage, instead of having steps. At the extremity of these side passages are circular staircases, 3 feet 9 inches wide, from the level of the pit corridor, to the top of the building, with communications on every tier. These staircases are intended to be used principally by the occupants of the dress-circle tier, communicating with the private boxes and stalls (which can be made) on the pit level, and to the private boxes on the upper box tier, with doorways communicating with the corridors of pit to upper box tiers, the stage, and also entering on the gallery.

The upper box tier is supported by eight iron columns, thrown back to the second row of seats, the height being 9 feet from floor of front row of dress circle to the ceiling, and 9 feet again from floor of upper boxes to soffit under gallery; there being a height of 12 feet from floor in front of gallery tier to soffit round the cove of the ceiling. The upper box tier is similar to the tier below, except that two private boxes are taken from it on either side: these, with the six in the proscenium, make in all ten private boxes, accommodating respectively four, five, and six persons. The corridors to the upper box tier have similar saloon and retiring-rooms to those below.

The gallery recedes a considerable distance, being continued over the box corridors and saloons to a depth on the incline of 51 feet from the front. It takes in the whole width of the building, the staircase being external, and though more than usual height to the soffit of the ceiling at the gallery part, enables those at the top to see clearly to the back of the stage, and also the foot-lights. The sides of gallery are formed by arches at the same springing as the proscenium—what is usually known as slips, but which in this case is called amphitheatre, and takes in the first three rows of the gallery, and can be filled at either pit or upper box price, at the option of the manager; the circular staircases at the sides of the proscenium being made available in the latter case, while the staircase to the gallery would be used in the former.

The ceiling itself is a flat dome, 36 feet in diameter, rising about 3 feet in centre. The ventilator—a circular shaft, 6 feet diameter, runs directly through the roof, with a second tube inside it from the sun-burner. There are also large and effective ventilators, with separate shafts in the gallery ceiling. The height from centre of the ceiling to floor of the pit is 42 feet.

The numbers accommodated upon each tier are as follows:—Dress-circle, 230; upper boxes, 220; private boxes, 50; pit, 350; amphitheatre, 200; gallery, 600; total, 1,650. In both tiers of boxes each person has a separate seat, with stuffed arms and back, the backs inclining 4 inches, and the seats being hinged so as to allow greater facility in passing. The whole are covered in a crimson cloth. There are no divisions in the boxes, but wide gangways are left from each door, which are left free from seats. The seats in the pit have raking backs, and seats sloping towards the back, stuffed, and covered with American cloth.

The stage has been constructed by Mr. W. Jones and Mr. S. Sloman, of London, aided as to consultations and occasional supervision by Mr. D. Sloman, machinist of Her Majesty's Theatre. The stage measures 55 feet wide, by an uninterrupted depth of 52 feet from the foot-lights, and 46 feet from the back of the proscenium wall.

The wall dividing this part from the auditorium is of stone, 18 inches thick (the proscenium pillars and capitals being of freestone, moulded and carved, and left its natural colour, free from paint or any decoration, except occasional gilding). The opening is 28 feet, and the height to apex of arch 30 feet. The stage entrance, as before mentioned, is on the left side, facing the stage, adjacent to a spacious magazine for scenery.

The stage staircases, two in number, of Pennant stone, 3 feet 6 inches wide, lead respectively to actors' dressing-rooms and wardrobe on the O. P. side, and actresses' rooms on the P. side, also below to the mezzanine floor. On a level with the stage is the green-room proper. Close by the prompter are property, furniture, and stage manager's rooms, and three dressing-rooms for principal performers. On the mezzanine floor, which is 8 feet high, are machinist's room, two store-rooms, armoury, kitchen, musicians' room, large room for supernumeraries, and numerous conveniences, with doors at back, just below the level of a large yard, belonging to the theatre. The whole of the mezzanine floor is boarded over, on level with stage, and a pair of folding-doors, 15 feet wide, opening into a yard, and street at back, so that scenery can be brought in and out with great facility. The beams supporting the fly floors are 22 feet from the stage on underside, the fly floors being 2 feet higher, and are 10 feet wide. The floors are cradled down to 18 feet, which is the height of the wings and flats.

The painting-room occupies the whole of the end wall of the stage the whole width, as at Covent Garden; the beams being supported on trussed girders. The fly floors are partly supported by iron rods from the main tie-beams of roof. The construction of the roof is simple. There are nine main tie-beams with framed principals and collars, and four iron queen-posts, dividing the strain upon the tie-beams into five equal parts. The purlins and rafters support a moderately flat roof, boarded and slated.

On the tops of the main beams over the stage are longitudinal pieces, which principally support the bridges and the machinery of the gas battens. The stage floor rises half-an-inch to the foot, and is composed entirely of sliders;—alternately two and three narrow cuts at the wings with wide ones at the entrances. They are all worked off by windlasses on the mezzanine floor. There are also the Corsican trap, four large traps in centre, and four smaller ones at sides in first and third entrances. A large bridge, 12 feet long by 4 feet wide, rises in the fifth entrance. The whole depth under the working part of the stage sinks to a depth of 16 feet, with a cement floor.

Fire-plugs, always charged from the city mains, are taken inside the building, with hose, spanner, and jet always attached. In fact, every precaution has been taken to prevent a recurrence of fire. To all open fire-grates throughout the building stone fenders are provided, with iron guards to all dressing-rooms. The warming of the house has been adapted so that the artists who minister to the public amusement shall have the benefit of it. A large apparatus is provided on the basement, level with mezzanine floor, and the hot air rises at the side of the stage, not far from the prompter, causing the draughts and cold air which usually congregate on the stage to be warmed, and so enter the house through the proscenium opening, equalizing the temperature.

The lighting of the house is by a sun-burner in the centre of the ceiling, with outer ring of lights, and covered with crystal decorations, which, together with part of the stage gas work, have been executed by Messrs. Jones & Son, of Covent Garden. Several experiments were tried to adopt a new mode of lighting the float, in accordance with suggestions in our pages. A sunk channel was made with continuous reflector, which answered well so far as the one light was concerned, but the difficulty was how to work the mediums, which, unless they came a considerable height from the stage, would not sufficiently mask the light from the sky border; and to get them to do this effectually, required a height equal to the ordinary reflectors of the old float lights. Time being very short, and the manager urgent that the old principle should be followed out, an improved form of reflector has been constructed, which masks the light all round, and is of less height than usual.

The decorations of the theatre are, as already mentioned by us, by Messrs. Green & King, of Baker-street, London, and were chiefly designed and executed by their artist, Mr. Devilder. The mode of treatment throughout has been in flat oils; the ceiling and proscenium arch being painted upon canvas, and pasted on. The former is divided into eight compartments, with allegorical figures representing comedy, tragedy, opera, ballet, pantomime, spectacle, farce, and melodrama; and medallions of Shakspeare and other dramatists of his date and style. The other ornaments are rather eclectic in character, principally taken from early thirteenth century illuminations and ornament.

The proscenium arch represents the "Seven Ages of Man," by a series of figures painted in outline, with strong black lines and slight shadow, on a pale blue ground, the parts of the arch at springing being filled with spandrils assimilating to the ornament in ceiling.

The box fronts are executed in carton pierre, by Messrs. White & Parlby, of Marylebone, London, from the designs of the architect.

The dress-circle front has a series of twenty-four panels, filled with subjects from the principal of Shakspeare's plays, painted in colours, upon a gold ground, alternating with the heads and heraldic devices of the English kings introduced in the historical plays. The colour of the box linings is a light grey green, perfectly dead, so as to prevent reflection. The hangings of the private boxes are of rose-coloured satin, with gold fleurs-de-lis. The contractor for the work has been Mr. James Dymond, of Bristol, with Messrs. Mann, Kerslake, and Colley, of Bath, as sub-contractors, respectively for the mason's, plumber's, iron and gas work. The general foreman has been Mr. G. Tasker, and the clerk of the works Mr. H. J. Elmes; the carving having been executed by Mr. H. Ezard.

The act-drop and a portion of the scenery have been painted by Messrs. Grieve & Telbin, of Drury-lane, and the remainder by the Messrs. Gordon, and others. The whole cost of the building, not including the site or main walls, which, with few exceptions, have been made available, has been about 7,000*l*.

The whole has been designed by and erected under the superintendence of Mr. Phipps.

CONSTRUCTIONS IN WOOD.

ENGLAND.

WOOD possesses all the qualities to make it a most important building material. The art to use it is called carpentry and joinery. The latter is part of the former, and is limited to the more delicate and skilful shaping of the wood. As far as one may judge from the ancient monuments, the art of joinery was not developed until the thirteenth century. Previously to that period the constructions denote that they were executed only with the saw, the axe, the plane, and jointer: afterwards the chisel and gouge were used in addition.

When man in his primitive state sought shelter from wind and weather it was natural that he would resort to trees, forming the branches into a roof. Gradually he cut the timber; and up to the twelfth century we find that the carpenter timbered the house, and the owner next filled out the space between with thick clay or rubble stone, to the best of his ability. An exception from this were the palaces and mansions of kings and nobles, whose habitations were built of stone since the ninth century.

The Greeks and Egyptians knew the use of wood, and we still see works of the latter; wooden coffins, for instance, in the British Museum.

The Romans were good and clever carpenters, and they had great experience. Some of their writers, like Pliny the elder, display a knowledge of wood in their works which would do credit to a builder of our times.

During the Middle Ages a noble creating spirit

brought architecture to such a high development that even now we go back to those times for examples and information.

Mediæval art received a serious check through the great Reformation, which shook every European state. The blow must have been severe, for only within the last sixty years has it begun to recover and again to step forward, producing happy results.

It is my intention to bring before your notice such monuments as I met with in my researches, in order to illustrate the progress of timber construction.

There is no doubt that an extended history of wood architecture would be a valuable addition to our literature. My notes must only be regarded as an attempt, with the hope that a more able person will before long do justice to the subject.

Much it is to be regretted that many wooden structures have been destroyed, and that even now they disappear gradually more and more to be replaced by masonry; but we must take what we have, and begin at home with England, which above all deserves our best attention.

It appears that the houses in our earliest domestic architecture had but one room, which is evident from the fact that the roof was supported by pillars. The sides were entirely filled out with wood, and the interior was divided by tapestry into apartments. The roofs were thatched, as it is recorded to us in the instance when the roof of the Royal mansion at Kennington was destroyed by fire: it was renewed and covered with straw. Subsequently the thatch was abandoned and replaced by wood, which has been transmitted to us with the name of shingles.

The roofs of the thirteenth century had a considerable pitch, and in many cases they were covered with shingles of stone, tiles, or slates. The open timber framing was generally very plain, and only seldom did it occur that the woodwork was painted. The latter was the case in the chapel built by Henry III., at Windsor, where the wooden roof was painted in imitation of another of stone at Lichfield.

The first attempt at ornamental wainscoting was made under King Henry III., in the twenty-third year of his reign, when he ordered his clerk of works at Windsor to work day and night at wainscoting a chamber in the castle, with boards radiated and coloured, so that nothing might be found reprehensible on that wainscot.

The furniture of this time was limited to tables either fixed or dormant, and resting on trestles, which latter were removed when not in use.

Every article appears to have been made on the spot for its purpose. Of this we find an account of Richard I., during his stay at Portsmouth, having trees sawn into planks and forming them into tables. The seats were also made of planks; and, in fact, the buildings of that time appear not to have had any moveable furniture. There is, however, the coronation chair, which is still preserved in Westminster Abbey. It is an elaborate piece of workmanship for that time. The lions on the lower portion are not in strict accordance with the upper part, and it is possible they may have been added at a later period. Similar specimens may have been in use amongst ecclesiastical officials in churches; but of these none are left to record. This assertion is based upon the fragments which at the present day may be seen in good condition. For instance, the reading-desk at Bury, in Huntingdonshire, which was made in the early part of the fourteenth century; and it is further proved by the interior decoration of several old churches.

Previous to the Reformation, the naves of churches which were occupied by the congregation were usually fitted with fixed seats, divided from each other by wainscoting. The ends of these were panelled or carved, and some are found with straight heads and others with carved poppies. Findon church, Northamptonshire, is one of the oldest and most perfect examples.

The ecclesiastical monuments bear the most prominent signs of the actual development of the age; and we must therefore refer to such remaining structures to guide us for information.

Although the Norman roof offers nothing worthy of imitation, the chancel of Adel Church, Yorkshire, is an example of that period. Next we have the simple roof over the porch of Heckington Church, Lincolnshire, which is a trussed rafter roof, too stiff to be pleasing. Long Staunton Church, in Cambridgeshire, is a similar example, with the addition that the roof is extended over the aisles. The roof covering the nave of Lympenhole Church, Norfolk, exhibits a different construction, much more pleasing than the two preceding ones, the difference being that in Lympenhole Church the braces traverse the collar-beam. Stove Bandolf Church, Norfolk, has a similar roof to the latter, with additional second collar-beam. The old roof of a house at Charney Basset, Berks, retaining its original feature, is of plain but good design: it has seven cants with tie-beams, king-posts, and struts. The king-post is octagonal, with square abacus and base. An example by far more interesting is afforded by the Hall at Stoke, Sey, Shropshire: it has principals which rest upon projecting stone corbels, and these are framed together with collar-beams. In the same building is a staircase of solid timber leading into a room, which is also built of timber. This building is a most perfect remainder, dating from the thirteenth century. In Kent we see apparently the original roof of the ancient manor-house of Soar, with tie-beams and king-posts: the latter have moulded caps. A roof of plain construction is to be seen over the hall in the Priory at Winchester: each pair of principals is supported by a wooden arch, which springs from corbels about 2 feet below the wall plate, with the collar beam at the point of the arch. A rather singular remnant may be seen in Oxfordshire. It is the wooden doorway to a barn, the ornaments of which are all cut in wood.

Under the sway of King Edward I. and King Edward II., and after 1272 to 1377, architecture was much promoted and made great progress; and with the appearance of the Decorated style we notice a feeling for improving the appearance of roofs by carving and moulding the principal timbers. An interesting illustration of this period we have in the church at Wimbotsham, Norfolk. The roof is boarded beneath the timbers, and is divided into panels by small moulded ribs, which have well-carved bosses at their intersections. In the roof over the chancel of St. Mary Magdalen Church, Norfolk, we find the introduction of principal rafters and purlins.

The roof over the south aisle of St. Martin's Church at Leicester, dates from the Early Decorated period; the circular principal of which rests on carved angels, the spandrils filled in with tracery, and the wall plates are all well-moulded. In its detail it is, however, not satisfactory, and produces less good effect than the originals from which it was re-constructed.

The roof of Trinity Chapel, Cirencester Church, Gloucestershire, is very similar to the preceding one. It has principal rafters and intermediate trusses into which the purlins are tenoned, and every part susceptible of enrichment has received it in the highest degree: the short height, however, imparts a depressed appearance on the design.

In 1364, letters patent were granted by Edward II. to take away the wooden shingles from the roof, which needed repair, and to replace the same with stone, slate, or tiles.

A portion of ancient shingle roofing is still in existence under a roof of later date at Igtham, Kent.

In the illuminated manuscripts of this century, we notice carved barge boards, and also in the representation of a projecting wooden bay window.

The houses in Scotland, during the fourteenth century, were mostly of wood, as may be read in the Chronicles by Froissart; and, considering the foregoing, we draw the conclusion that wood architecture was in a great state of perfection at an early period.

Owing to constant improvements and alterations, it is impossible to determine exactly the various periods, because old timbers and productions in wood were used in the construction of new houses. For the same reason it is difficult to say whether examples were new in design or copies from earlier buildings. Such an instance we have in the ceilings of Neworth Castle, which is richly carved, and bears the character of the fourteenth century, although the structure was almost entirely rebuilt towards the close of Queen Elizabeth's reign.

Up to those times the common place of assembly or meeting was in the hall of the houses, which also formed the principal room: part of the hall was screened off at the lower ends by a wooden partition, above which was the gallery. In churches these screens were used for various purposes, and in most instances their lower portion is close panelling with open work at the top.

The oldest piece of screenwork is in Crompton Church, Surrey. It bears a transitional character from the Norman to the Early English period.

Of Early Decorative character we have the one in the north aisle of the choir in Chester Cathedral. The roof, as already mentioned, was generally open timber work, and sometimes richly decorated; as, for instance, at Malvern and Baggiley. We find cases where a stone arch was thrown across the room to support the principals, as at the Mote, in Igtham, Mayfield, &c.

During the fourteenth century glass was introduced into most of the domestic buildings, but only in the upper portion of the openings; whilst the lower one was was still closed with a wooden shutter. Such an example is to be seen in the window of the hall at Marne, in Somerset. With regard to furniture, it is mentioned that during the time of Edward II. a large oak table was bought for use in Westminster Hall, at the price of 1*l.* 13*s.* 4*d.* The celebrated oak table at Windsor was made in 1356; and during that century many luxuries came into use, which may have resulted from the intercourse of this country with France. The luxuries served principally as an interior accommodation of the rooms. In the wardrobes of this period we find some remnants in the shape of lockers or chests: most of these are preserved in churches; but whether they were originally made for them remains an unsettled question.

Chests seem to have been very important furniture in olden times, for they served for the safe keeping of all valuables. The oldest chests known in England are at Climping Church, Sussex, and at Stoke, D'Abernon, Surrey: next follow those at Graveney and Saltwood, in Kent. The latter is richly ornamented with carvings not deeply cut, and decorated with ironwork.

The chests of the Decorated period are mostly panelled, and ornamented with carvings, which are confined to the fronts. A fine example of these is still to be seen at Grimmingham, Norfolk.

The perpendicular style is little different from the former. An interesting specimen is to be seen in the Court of Chancery at Durham, which was made from 1333 to 1345. It is strongly bound with iron; the latter a little ornamented on the top. The inner side of the lid has heraldic paintings, of which the colours are still visible. The roof of St. Andrew's Church, Norwich, is a very pleasing example. Little Welnetham Church, Norfork, although a late specimen, is a very good one of the hammer-beam roof: two intermediate trusses occur between the main ones. An exceedingly plain roof is over the nave of the chapel of St. Mary's Church, Suffolk. Hammer-beam roofs of a steeper pitch are seldom met with. The whole of the timbers are well moulded, and the cornice is very effective.

The engineering feature of this age, such as wind and water mills, are spoken of in Doomsday Book; but we have no specimens to refer to.

About this epoch guilds began to establish themselves, and they were in the habit of building their halls close to churches, owing to their connexion with that establishment. Few of such interesting structures have been preserved. The Town Hall at Ashburton, in Devonshire, is a curious and early building, entirely of timber.

In the timber roof over the nave of Wimbotsham Church, Norfolk, the collar-beams are placed low down, so as to equalize the sides and angles of the polygonal soffit: these are boarded over and divided into panels, by mouldings which have carved bosses at the intersections. These, as well as the mouldings, bear traces of having been richly coloured.

The roof over the chancel of St. Mary Magdalen Church in Pulham, Norfolk, shows a bold construction; and the one over the south aisle of St. Martin's Church, Leicester, is very interesting, and dates probably out of the Early Decorative period. The tie-beam, with the braces, form nearly a semicircular curve. This arch is beautifully moulded, and the spandrils are filled in with tracery. Similar to this is the roof at Sparsholt, in Berkshire. The roof over the chancel in St. Martin's Church, Leicester, has a tie-beam, but no principal rafters: the purlins and ridge are supported by struts, the intermediate spaces having tracery, and the tie-beam is supported by curved braces.

From the end of the fourteenth century we have still the roofs over the nave and transept in Ely Cathedral. The large curved truss in this is of one piece.

The triangular corners are filled out with joists, which firmly combine the trusses with the rafters. The great strength of this roof consists chiefly in the large timbers used, and in the extreme pointed curves, by which the greater part of the thrust is brought upon the struts downwards.

This combination in the Anglo-Norman style has led to clever and bold constructions.

As the most developed must be looked upon, the roof in Westminster Hall, which is 239 feet long, 68 feet wide, and 90 feet high: it is a mag-

nificent example, almost unique: I do not know anything equal to it. The timbers are all well arranged: the roof is formed on the common pitch: the length of the rafters are about three-fourths of the entire span; and to provide against lateral pressure, there are, throughout the length of the hall, principals at about 18 feet distance from each other. These abut against the wall between the windows, and have arch buttresses in the outer wall. Every truss comprehends one large arch, and springs from corbels, 21 feet below the base line of the roof, and at nearly the same height from the floor. The ribs forming the arch are framed into a beam connecting the rafters in the middle of their length. A smaller arch is turned within the larger, springing from the base line of the roof, and supported by two brackets, which rest in the springers of the main arch. Smaller timbers are placed to bring the weight and pressure upon the principals. By this arrangement and by having the springers so far below the top of the wall, a firm abutment and great security have been obtained.

The quality of wood used in this roof was so well selected, that, after withstanding the ravages of four centuries, it remains to this day in perfect condition. The hall was built under William II.

The Preceptory of the Hospitallers at Chibburn, rebuilt towards the end of the fourteenth century, has some interesting specimens of old wood work, such as the partitions, and the lower floor, which is entirely of oak. The beams are moulded, and the planks, which are very small, were planed on the lower side, and had an ornament in red painted on them.

In Castle Neworth, Cumberland, we admire the massive ceiling over the library. The wall-plates, principals, and rafters, have characteristic mouldings of the fourteenth century; and the intersections are dressed with extremely well executed foliage carvings of the same period. The bosses immediately on the crossings of the timbers have been lost or destroyed, but the panels between the rafters are filled with tracery of considerable variety.

Trunch Church, Norfolk, has a hammer-beam roof: the hammer-beams project too far; but the tracery in the spandrils has a most pleasing effect. In the same church are to be seen the remains of a beautifully-carved and coloured screen, also old open seats.

The roof of the church at Worsted is very similar to the one just described; but the nave being wider, and as the hammer-beams do not project so far, it gives a far grander impression.

One of the most beautiful roofs of this period is in Wymondham Church, Norfolk, the carving being exquisitely executed.

Marston Church, in Bedfordshire, retains its old roof, partially coloured, and also a portion of the rood-screen, richly carved and coloured, as well as a few old seats.

The old seats of St. Mary, the Virgin, Wigenhall, Norfolk, have a profusion and a variety of carving.

Burton St. Lazarus, in Leicestershire, has a tie-beam roof, which, though of low pitch, is not without merit.

Next we come to Baggily Hall, Cheshire, which is a very old timber edifice. The only part now remaining is the great hall. The roof is carried upon wooden arches and pillars, standing a few feet from the side walls, and the space is filled in with open trefoils.

At Maxstoke Castle we also find remnants of timber edifices from the fifteenth century in some richly carved doors.

In the walls of an inn at Coventry are wooden windows richly decorated with tracery, which no doubt have come from an earlier and more important building.

The Templars' Hall at Balsall is a wooden structure mantled with brickwork. It is of considerable size, and the interior is divided into nave and aisles, by massive wooden pillars: also worthy of notice is the former timbered hall of the Abbot of Malvern.

Turning our researches into Berkshire, we find in Bisham Abbey, over one wing of the house, a fine timber roof of the time of Edward I., with tie-beams, king-posts, arched braces, and moulded wall-plates.

At Sutton Courtney is a house from the middle of the fourteenth century, at which there remains the original timber roof over the hall. It is very lofty, canted, and supported by king-posts, with struts resting on wooden arches, which rise from stone corbels. The arches and purlins are moulded. The solar also retains its original roof.

The Hall at Penshurst, in Kent, possesses excellent woodwork; amongst which is a richly-carved screen. The roof of the hall is also a fine specimen of timber work: the king-posts and collar-beams are well moulded, and grotesque full-length figures are carved into the wood.

The moat house at Igtham, Kent, is interesting for its wooden doors. The chapel has a wooden barrel ceiling and seats; and considering its condition of perfection it forms one of the most important chapels of that period.

At Gouldhurst, in Kent, is a remarkably fine doorway to a cottage, worked in oak and well moulded.

Wingham has some good timber houses of the time of Edward III., but most appear to have had their origin at a later period.

Broadstoke Priory has retained part of its domestic buildings. In the refectory is the ancient roof.

A timbered house of this period, with barge boards, is found at Salisbury.

In the Close at Winchester, in Hampshire, may be seen a timber hall from the time of Edward II.

Somersetshire retains a singular example in the now termed "Fish House," at Mearne, built during the reign of Edward III. Shrewsbury contains some good timbered houses of the same period: also the small town of Welsby, in Herefordshire. The latter are remarkable for their barge-boards and panelling, in flowing tracery patterns.

At Brecon, in Wales, we have in the old refectory of the Convent of St. Nicholas (at present Christ College) a fine roof left. The principals are cut into foliations, and the wall-plate shows a moulding of Early Decorated character.

The succeeding period, with the beginning of the fifteenth century is marked with a decided advance in the application of wood for various purposes; and such remains as are still in existence we look upon as favourite subjects.*

JOSH. JUSTEN.

THE ALBERT NATIONAL MEMORIAL.

THE Prince Consort Memorial Committee held a meeting on Saturday last, when it was resolved that, provided permission from the proper authorities can be obtained, the designs for the memorial submitted by the seven selected architects shall, for the convenience of members of Parliament, be exhibited in the Royal Gallery at the Houses of Parliament. The proposed exhibition may not take place immediately.

It is not at first sight obvious that "members of Parliament" have any special concern with the design; unless indeed it be proposed to obtain a Parliamentary grant in aid of the sum subscribed by the public. Doubtless, however, the committee fully understand what they are about.

Some esteemed correspondents inquire, not without pertinence, whether or not the designs have yet been seen by the Mansion House Committee, appointed by the public to erect the memorial, and by whom the funds have been collected.

NEW MATERIALS FOR THE LIFE OF JOHN BACON, R.A.

JOHN BACON is a great name in the history of English sculpture. Many statues have been erected in St. Paul's in the sixty and four years that have passed since Bacon's death, but with the two exceptions of Flaxman's Sir Joshua Reynolds and Chantrey's General Gillespie, there are no standing statues in our metropolitan cathedral that can be named in the same breath with Bacon's Dr. Johnson and Bacon's John Howard. They were cheap enough. My father, in his "Life of Bacon," has omitted to mention what they cost: I now supply his omission. For the "Johnson" he received 600*l.*; for the "John Howard" one thousand three hundred guineas, a difference of price which the "Howard" bas-relief will hardly account for: the "Johnson" has no bas-relief.

Let our sculptors contrast the "Johnson" *six hundred pounds* with the sums received by the elder Westmacott, by Chantrey, by Baily, and others. I remember very well when (1841) a suggestion was publicly made that the whole of the money raised for a statue to Sir David Wilkie was too much for a statue, and that a portion of the subscription should be funded for an annual "Wilkie Medal" for excellence in painting. Sir Robert Peel was in the chair when the suggestion was made. Sir Robert appealed to my father, who was near him, "Don't starve the statue," said my father. I think I see once more the smile of full conviction which pervaded the face of our great statesman. The medal suggestion was no more heard of; and the late Mr. Joseph received for the "Wilkie" nearly *three* times the sum that Bacon received for the "Johnson." The smaller sum produced the better statue.

Bacon has had *two* biographers,—the Rev. Richard Cecil, vicar of Bisley, in Surrey, who died in 1810; and my father, who died in 1842. With respect to what Bacon was "as an artist," Cecil's work is valueless; with respect to "what," in the words of his epitaph, "he really was as a Believer in Jesus Christ," his work is of importance. As "a man," Bacon was handled severely by my father, and, from all I can learn, too severely. In the autumn of 1844 I was at Worthing, on the coast of Sussex, with my family. In the same house (5, Bath-buildings), on the drawing-room floor, was lodging a staid, demure, elderly gentleman of the name of Bacon. Who Mr. Bacon was I never asked—certainly it never occurred to me that I was living in the same house with the son of the great sculptor of the Chatham, John Howard, and Johnson monuments: I sincerely wish that I had known who my fellow-lodger was, for most assuredly I should have sought his acquaintance, for the courtesy of his manner and the "new materials" his conversation was sure to supply for a new edition of my father's "Lives." The following interesting letter first made known to me the pleasure and instruction I had missed:—

To Mrs. Peter Cunningham.

"Charnock-place, Winchester,
25th September, 1851.

Dear Madam,—A word dropped by yourself, while I was taking leave, on the subject of the late Mr. Cunningham and my late father, signifying, as I understood you, that they had known each other, induces me to trouble you with this note; as I am quite sure there could be no personal acquaintance that enabled Mr. Cunningham to estimate my father's character. It is now a quarter of a century since my father's name appeared in the 'Family Library.' The writer has given him credit for eminent genius and ability in his profession, but has thrown out very ungenerous insinuations against his character; which, I grant, ought to have been refuted at the time; but I thought that I should only be brought into a profitless paper warfare, and that new statements, as foreign to truth as the first, would be put forth; and I therefore allowed all to pass, without even a remonstrance.

I am willing to believe that the biographer, not knowing my father personally, was satisfied in taking much of his description from the sculptors in the Royal Academy, all of whom, at that time, were actuated by envy and disappointment at my father's celebrity and success in his profession. But for this, no such statement could have been printed for the public eye as that he made an 'audacious proposition to the Government to do all the national monuments at a certain per-centage below the Parliamentary price.' All this I pronounce to be, with much more introduced at the same time, *a gratuitous unqualified falsehood.* I well recollect when the order came to my father to prepare designs for all the public monuments which the House of Commons had voted for five of our naval commanders; which order was, in like manner, sent to the other sculptors who were Royal Academicians. It is true that *two* out of the *five* were adjudged to my father, but quite unexpectedly to him; nor would he have prejudiced his name by 'daring,' as the biographer calls it, to ask for more than his share.

I need not advert to the contempt which is cast over his religious opinions and habits. He was unfairly dealt with in this respect; and if the world were not too ready to join in such scandal, it would be labour spent in vain.

Believe me, &c., J. BACON."

It is impossible to read this letter from a clever son in defence of his father's memory, written five-and-fifty years after his father's death, without a respect and regard for the filial reverence of the writer. What defence of my father, if any, I made, beyond a letter of acknowledgment, courtesy, and compliment, I cannot now remember.

The history of prices in art is instructive. For the Westminster Abbey "Chatham" monument Bacon received *six thousand pounds.* I have seen the agreement, dated 8th March, 1779. The monument was to be erected before the 25th

* Read at Liverpool Architectural Society. To be continued.

December, 1783, and Bacon fulfilled his engagement. This, at the time, was the highest sum ever given for a monument; nor do I believe that it has been since exceeded by any public grant or subscription for a monument *in marble*. Larger sums have since been received by sculptors *in bronze*. The late Matthew Cotes Wyatt had close on fifteen thousand pounds for the West End Wellington; Chantrey had, with money and gratuitously given gun-metal, something like seven thousand pounds for the City Wellington. What did Mr. Foley receive "in all" for his Calcutta Lord Hardinge? Was Bacon's two thousand pounds, minus the much canvassed two and a half per cent., a large sum for the bronze King George III. and the bronze Father Thames in the courtyard of Somerset House? and was not Sir Richard Westmacott's alleged *ten thousand pounds* pay for "the Hyde Park Achilles" the highest sum ever given for the mere reproduction in metal of any statue? The present able Professor of Sculpture in the Royal Academy of Art—Sir Richard Westmacott's son—will perhaps kindly enlighten us on this point.

There are very few busts by Bacon; but the few are fine in conception, and very fine in execution. His King George III., at the Society of Antiquaries, has an indescribable excellence in it,—unlike Nollekens and unlike Chantrey. There are duplicates of his "What George, what Third" equally fine. The "carving" I can compare only with the die-sinking of Simon in the far-famed "Petition Crown" of Charles II.:—that crown—the envy of all collectors of coins. My old friend Joseph Theakstone, of whom I have already made mention in this series of articles for his unequalled skill in making marble look like satin or ermine, wrought under Bacon, and from his conversation while at work in Chantrey's studio, my father derived all he knew from "men" of Bacon as a man.

That Bacon should die worth "sixty thousand pounds," *without* making busts, seems to me inexplicable, and that Flaxman should die worth only "four thousand pounds" (equally unproductive as he was of busts), seems to me incomprehensible. The money amassed by Nollekens and Chantrey, married, but childless (one greedy, the other grasping) I can understand; but I cannot see how Bacon acquired, by sculpture alone, the large sum he was unable to take with him. And here I will observe that the English sculptor who should have amassed the most money from what physicians and lawyers call their "practice," was the elder Westmacott. Sir Richard flourished in the great era of Parliamentary votes for soldiers, seamen, and statesmen, and had *more* than three sculptors' shares of the monuments voted by Parliament. What was Sir Richard Westmacott's property "sworn under" at his death?

"*Si monumentum requiris*" is Sir Christopher Wren's best monument; a like inscription should have served for Guy, the founder of the noble hospital in London which bears his name. There were Guy governors, however, who, when Bacon was alive, thought otherwise; and Bacon, at the cost of one thousand pounds (prices of labour, skilled or otherwise, I like to quote and see quoted) made a monument to Guy, that,—"shouldering God's altar," as it does,—adds nothing to Guy's munificence of soul, or Bacon's fame as one of the greatest sculptors England has produced.

PETER CUNNINGHAM.

LECTURE ON SCULPTURE: ROYAL ACADEMY.

THE subject of the fourth lecture delivered by Professor Westmacott, was the great importance to sculptors of practising their art strictly according to those conditions which enable them to develop its special resources. It was explained that, though painting and sculpture have a common object in addressing themselves to the senses, they have totally distinct means of doing this; the one affecting its purpose through colour, the other through form. In like manner, the mode of using these means differs according to the capabilities afforded by the language belonging to each art. The success of each depends upon the right use of its own means; and the attempt to appropriate what is essentially an element of success in one with the view of assisting the other, must result in weakening, instead of strengthening, its effect. To give positive substantial form to any object in a picture, would inevitably destroy the effect of all other flat parts of the work; because the raised object would not only impede the view of other objects, but it would, of course, carry its own proper lights and shadows, which latter would obtrude themselves in the place of the picture to the detriment of the painted portion; and if the picture should happen to be so placed that the natural light should fall from the right hand, while the painter's simulated light falls from the left, the real shadow of the relieved object would cross those of the picture.

Again, on the other side; treating sculpture—an art strictly confined to form—in the same category as painting, with respect to subjects chosen for representation, and to the arrangement of extended compositions, involves the danger, nay, the certainty, of similar contradictions and anomalies.

The question of colouring and tinting sculpture is not necessarily connected with the present inquiry, which is addressed rather to design and composition. Nor will it be expedient to enter upon the best mode of designing single statues or groups. Being seen all round, these must always produce their own natural effect. They will have true light and shadow wherever they may be placed; differing in this from a picture, inasmuch as the painter, whose composition is independent of natural effects, may arrange his simulated *chiaro 'scuro* in any way he pleases. It is not intended to say that composing a statue or group is not a matter of great importance and difficulty, requiring study, and calling for the feeling and judgment of a true artist; but the object of the remarks here offered is to show how much more is required, in the case of sculptors, in choosing such subjects as shall come within the possibilities of their art when they have to do with such complicated or extended design as may be attempted in *rilievo*.

One of the greatest dangers, in sculpture, is the fascination of the picturesque; by which term is meant here the temptation to arrange a design on the principle of a picture; with a variety of objects, on different planes, with middle distance and background. They are thus induced to introduce accessories, quite forgetting that what the imagination is supplying while they work is absolutely unproduceable in fact, and it is with fact only that a sculptor has to deal. Whatever impression he means to produce upon the spectator must be effected by the only means at his command, the form of the object. It becomes, then, a question of the highest importance to him what subjects allow of formal presentation and what do not.

An artist may sketch in mere outline, in black chalk, pencil, or with pen and ink, a fancy subject, and may clothe it, in imagination, with every fascinating accompaniment; the gorgeous brilliancy of sunrise or sunset, or the lurid effects of night, and storm, and darkness; but this is not yet a work of art: these effects are only supposed by himself, not represented to the sense of others. But if our artist be a painter he may do this. He may at once make his sketch day or night, light or dark, as he pleases. He may enrich his work with all the hues of the rainbow, and force the spectator to participate in his invention and fancy.

But suppose the artist to be a sculptor. Let him have made his pencil sketch, preparatory to the execution of the work itself. Let him try to supply by means of his art what the painter has done by his. How will he succeed with his sunrise or his sunset? How is he to express day or night, light or darkness? Can he render light at all, so as to give any character to a composition? No, and to pretend to do it is extreme folly. A sculptor's sun can only look like a flat disk or counter, and his rays of light, if he should have the boldness to attempt to make rays of light palpable, will assume the form of a carefully arranged bundle of matches, radiating from counter aforesaid. The painter has also another power denied to the sculptor. He can, at least apparently, throw distant objects into perspective. Sculptors have attempted this also by the incomplete devise of making some objects very small compared with others, as if taking one condition of receding lines would supply all that is necessary. The effect of the interposition or air tints is quite as essential here as diminution of size, and perspective without atmosphere is an anomaly in a completed work of art. But every object in sculpture must have or should have its proper form, and how would a sculptor prevent the shadow of any figure falling right across his sun, be it rising or setting, or his clouds, or against the top of a tree meant to be, perhaps, miles off? A work, whether in *basso* or *alto-rilievo*, depends upon its position, as regards positive light, for its effect; and the sculptor should always remember that a shadow, naturally cast, is as strong in colour from a small object as from a larger one, though there may be less of it; so that the shadows thrown from the rays before alluded to would be in their colour as intense as those cast by any foreground object. The doctrine here laid down was enforced by a reference to various interesting examples exhibited on the walls, from Ghiberti, B. Cellini, and others, showing the effect of disregarding this principle, while Mr. Westmacott observed that there scarcely is an instance, if one, in the sculpture of the best schools of Greece where the subject is represented in different planes. This is a valuable fact if any stress is to be laid on the lessons afforded us by the greatest masters of the art.

The sculptor may ask what he is to do when he is called upon to represent buildings in perspective, backgrounds of landscape, and similar subjects. From what has been said it would seem his reply should be a very simple and a very sensible one. If his art cannot do it, as he knows it cannot satisfactorily, let him say so, and refuse to weaken the power he really has by frittering away his time and talent on what never can do him credit. A painter would not accept a commission in which he should be required to represent his foreground groups in relief; and still less would he undertake to expressing the rolling noise of thunder, or the sounds of harmony. The sculptor's sunset, or tempest, with its lurid clouds and pelting rain, are in precisely the same category. They are beyond his art, and he must leave them alone. Though in the case of such works as medals and coins, some modification of the rule might, perhaps, be allowed, even the great skill of some of the medallists of the sixteenth and seventeenth centuries cannot altogether reconcile us to the infringement of a law founded on reason and sound principles.

Having thus shown the conditions by which the sculptor is bound in the exercise of his art, the lecturer said it followed, of course, that there must be a class or character of subject more or less fitted for sculpture. It did not at all imply that sculpture was an art without sufficient force and power because it could not safely adopt the special qualities of another art. On the contrary, using its own means judiciously, and not challenging comparison where none can properly exist, it is an art capable of most powerful appeal to the sense. Nor does the limitation insisted on necessarily make it tame or ineffective, nor does it deprive it even of the element of picturesqueness up to a certain point. This was exhibited in the case of the frieze of the Parthenon, representing the busy crowding, the variety of character, and the lively movement of the various personages engaged in the Panathenaic procession. No work we are acquainted with gives so valuable a lesson for the guidance of the sculptor, in extended design, as this. He will have no reason to think humbly of his art when he sees, as here, how one of the most difficult complicated subjects may be treated by true genius submitting itself at the same time to wholesome laws.

The great principle the sculptor should keep steadily before him is that, as his means are of the simplest,—form only,—so the spirit of his designs should be under that influence. He must remember that the subjects he is to represent by his art can only be effectively prosecuted when they enable him to expend upon them all his own great resources. In the preceding lectures, on form, the value of simplicity and breadth was strongly urged, against the opposite of cutting up the masses by unimportant details and small parts. In selecting subjects for sculpture the same rule should be obeyed, and those should be preferred that will allow of a mode of treatment which will give force to these essentially-valuable qualities; for what applies as an objection to small parts in form, applies equally to introducing too great variety and multiplicity of materials in design. The object the sculptor should try for is, to fix attention at once on his work, and by concentrating and intensifying the motive of his design, to incite all the interest of the spectator. Attempting various effects, and employing means out of the legitimate pale of his art, can only distract the attention, invite unfavourable comment and criticism, and weaken the impression intended to be made.

FALL OF AN ARCHWAY AT LEEDS.—An arch which has just been completed in the basement of a building in Commercial-street, about to be transformed into a bank, has given way, burying two men beneath the ruins. One was taken out dead, and the other lies at the Infirmary in a precarious condition.

THE LATE DUCA DI SERRADIFALCO.

OLD members of the Institute of Architects, or those whose travels extended to Palermo, can scarcely be ignorant of the name of the Duke di Serradifalco, an honorary and corresponding member of the Institute, whose death has recently been recorded.

Domenico lo Faso Pietrasanta; Duca di Serradifalco, e Principe di Sto. Pietro, under the influence of the lessons of Cagnola of Milan, manifested early in life a taste for archæology, which in the course of later years developed itself in the investigation of the architecture of the ancient Greek and Siculo-Norman periods in Sicily. His chief work, in five folio volumes, "*Le Antichità della Sicilia*," was undertaken prior to 1834, in which year the two first volumes were published at Palermo; and the subsequent volumes appeared in the years 1836, 1840, and 1842. The work relates to the remains of Segesta, Selinus, Girgenti, the ancient Agrigentum; Syracuse, Catania, and Taoromenia, and others; each volume comprising from about 100 to 300 pages of letterpress, and about twenty to forty illustrations—some of which are lithographed, but the bulk of them engraved. Amongst the matters of detail which these illustrations present, are many concerning polychromy. These, however, may be serviceable chiefly to those who read the text,—many of the illustrations belonging rather to restoration than to representation of fragments in the broken and half-obliterated state in which they must have been dug up or found. In 1838, or prior to the completion of the work above mentioned, the Duke published a folio volume on the Church of Monreale and other churches of the Siculo-Norman period,—"*Del Duomo di Monreale, e di Altre Chiese Siculo-Normanne*,"—containing eighty-nine pages and twenty-eight lithographs and plates, besides vignettes. This work, along with the illustrations of the churches of Monreale and Cefalu, which illustrations, unfortunately, are wanting the colour, gives plans of many Eastern and Western churches on the same sheet, so that features of the leading examples of different countries can be compared.

The Duke di Serradifalco, during many years, was the head of the Sicilian cabinet; but his opposition to the anti-constitutional measures of the Bourbons in 1812 to 1814, threw him into the different sphere in which his taste for antiquarian pursuits found occupation. In 1848, however, prior to which time we recollect his attendance at a meeting of the Institute, he directed, with Ruggiero Settimo, the insurrectionary movement in Palermo, when he took a seat as an hereditary peer, in the Senate, of which he was chosen president; and he soon afterwards accepted the mission to offer the Sicilian crown to the Duke of Genoa. The result of the Sicilian movement procured him the honour of exile at the hands of Ferdinand II. He took up his residence in Florence, where even subsequently to the liberation of Naples and Sicily, he continued to reside; and, there, he lately died, aged eighty-two years. The Duke di Serradifalco was a member of all the chief academies and societies of Europe, including the Institute of France (Académie des Beaux Arts), the Archæological Institute of Rome, the Lombard Institute, academies of Naples, Palermo and other Italian capitals, the Historic Academy of Sweden, and others. He was also we believe, a doctor of the University of Oxford, and a commander in the French Legion of Honour. He is said to have left a large fortune to his only daughter, who is married to the Marquis de Torrearsa. A lithographed view of his villa at Palermo, heading a letter written presenting one of his volumes to the Institute, which letter is in the copy of the work, may bring back pleasing recollections to some of those we have alluded to, to whom this learned and excellent Italian nobleman showed hospitality and attention.

MARLBOROUGH HOUSE, LONDON.

FOR a long time past works have been going forward in this—so far as the exterior is considered—unsightly palace. Indeed, we are not fortunate in our metropolitan palaces generally, and few things are more disappointing to the stranger who comes "lion hunting" to London than the sight of Buckingham Palace and St. James's; notwithstanding, the former has some good points, seen from the garden, but the parts which are presented to the sight of the public are unsatisfactory. Two or three picturesque peeps at St. James's may also be obtained, but upon the whole, both as regards it as an architectural feature of the metropolis and a place for court ceremonials, it is unsightly and most inconvenient for the purposes to which it is at present applied.

Little can be said in favour of the external appearance of the future residence of the Prince and Princess of Wales, notwithstanding that it was designed by Sir Christopher Wren. Even its best front, which faces the park, is heavy and dull, and the effect has been still further damaged by the removal, at some time, of the sculpture from the niches and some other parts, which we meet with in the old views. A raised terrace next the park screens a garden of considerable extent from the view of passengers that way, and in the grounds there are some very fine trees, which, in the summer-time, have a pleasant look. Even now the birds are singing pleasantly amongst the branches, to an extent which few would think likely so near the bustle of a great city. The whole surface of this garden has been recently drained with care, but the spot has suffered some neglect since the late Queen Dowager's residence here. With skilful and tasteful gardening, and the judicious introduction of fountains, fit pieces of sculpture, and plants and flowers, it may soon be made an agreeable spot. Towards Pall Mall, adjoining Marlborough House, are seen part of St. James's Palace and the German Chapel on one side, and on the other some curious groups of the backs of old houses which front towards the street; these are, however, partly hidden by the new stables, which are of considerable extent, and promise to be good specimens of their kind of construction.

Those who remember Marlborough House when it was occupied by the schools of art and the Vernon pictures, would be surprised at the change which is wrought in the interior. Skilful decorators have been engaged on it; and, as the late lamented Prince Consort planned, and for some time superintended, the arrangements, we have no doubt that, when the furniture and pictures come into their places, the apartments, if not grand or striking, will present an appearance of much elegance and comfort. The painted staircase is spacious; and some of the chief apartments are of good proportions; but in other parts the accommodation needed for so large a household will be found with difficulty. Some of the rooms will need care as to ventilation.

When all is complete, the decoration of this house will form a useful study; and it will be seen that, although various kinds of ornamentation have been used, these are made subservient to the preservation of the general good effect.

The Pall-mall entrance to this house is inconvenient, and even of poorer appearance than the garden frontage. The duchess of the great Duke of Marlborough formed a new entrance, and was busy making the necessary purchase of the adjoining property, when Sir Robert Walpole, wishing to vex her, stepped in and bought the leases she was looking after. Respecting Marlborough House Pennant says,—"To the east of St. James's Palace, in the reign of Queen Anne, was built Marlborough House, at the expense of the public. It appears by one of the views of St. James's, published before the existence of this house, that it was built in part of the Royal Gardens, granted for that purpose by her Majesty. The present duke [Pennant writes in 1793] added an upper story, and improved the ground floor, which originally wanted a great room. This national compliment cost no less than 40,000*l*."

As regards the site, Pennant's account is corroborated by other authorities, who say that the mansion of the famous John Churchill was built on ground "which had been used for keeping pheasants, guinea-hens, partridges, and other fowl, and on that piece of ground taken out of St. James's Park then in possession of Henry Boyle, one of her Majesty's principal Secretaries of State." But as regards the building of the house the Duchess of Marlborough gives an account very different from Pennant. She says, "The next grant of which by my Lord Godolphin's means I obtained the premises of the Queen [Anne], after the Queen Dowager's death [Catherine, Queen of Charles II.], was the ground in St. James's Park, upon which my house stands. This has been valued by my enemies at 10,000*l*.,—how justly, let any one determine who will consider that a certain rent is paid for it to the Exchequer, that the grant was at first but for fifty years, and that the building has cost between 40,000*l*. and 50,000*l*., of which the Queen never paid one shilling, though many people have been made to believe otherwise."

In 1817 Marlborough House was purchased by the Crown for the Princess Charlotte and Prince Leopold, the present King of the Belgians, and after the death of William IV. was the town residence of the Dowager Queen Adelaide. In 1850 the mansion was settled on the Prince of Wales, on his attaining his eighteenth year, and meanwhile the building was granted, as we have already said, to the Department of Practical Art.

We do not meet with many historical associations in connexion with this place worth mention. The Great Duke, however, died here in 1722, and a pompous funeral procession issued from the plain, ill-fashioned gateway. Afterwards the duchess, in bed as usual, received the Mayor and Corporation of London when they came to thank her for the present of a fat buck. On such occasions the rather querulous lady loved to talk of her neighbour George the king, at St. James's Palace. It is asserted that Wren was employed to design this building for the purpose of mortifying Vanbrugh. It cannot be said, however, that the result was satisfactory.

At one time the Prince Regent had an idea of connecting St. James's Palace with Marlborough House and Carlton House, for the purpose of forming a gallery of Royal and other eminent personages. This plan, it is reported, gave place to some other proposed by Mr. Nash.

OTTAWA (CANADA), WITH ITS PARLIAMENT BUILDINGS.

A VIEW has been published, which gives a good idea of the magnitude and importance of the Parliament Buildings, now in progress of construction in the new capital of the Canadas; the selection of which, it will be remembered, was made by the Queen on its being jointly referred to her Majesty by the colonial legislature. The foundation-stone was laid with great ceremony by his Royal Highness the Prince of Wales on the occasion of his visit to the British North American provinces in the year 1860. The works, although stopped in the winter of 1861, have progressed considerably since their commencement; the masonry of the Government offices on the eastern and western blocks of buildings being now completed, excepting the towers. The Parliament Houses, or central building, with the legislative halls, cannot be reported in so forward a state; but it is said, should building operations be commenced vigorously in the spring, that the edifices will be ready for the occupation of the Canadian Government, with the various departmental suites of offices connected therewith, early in next year; so that the perambulating system hitherto adopted, with the accompanying heavy expenditure, it is hoped will be terminated with this last removal to Ottawa. There seems no longer any doubt but the decision of her Majesty will be carried out in good faith by her loyal Canadian subjects; all opposition and conflicting interests having now effectually died out on this long vexed question between the colonists.

The grounds will be laid out, having raised terraces, and walls terminated with drinking fountains, forming the quadrangle, in the centre of which it is proposed to place a statue of her Majesty; the whole to be inclosed with dwarf boundary walls and ornamental wrought-iron railing. The heating of the buildings will be effected by means of steam pipe coils throughout; the system being that generally known as the vault system. These vaults, with the cold air ducts and the various ramifications for ventilation, communicating with the external atmosphere, terminating in the retaining walls facing the river, have been constructed at great cost to meet the necessities of the climate.

The works are being carried out by Mr. McGreevy and Messrs. Jones, Haycock, & Co., contractors, under the direction of the architects, Messrs. Stent & Laver, and Messrs. Fuller & Jones.

THE PRINCE CONSORT MEMORIAL, HASTINGS.

IN April last a premium was offered by a committee, consisting of the mayor, Dr. Cross, and several other influential gentlemen of Hastings, for the best design of a memorial of H.R.H. the Prince Consort. Thirty-seven designs were sent in. After they had been exhibited, one by Mr. Edward A. Heffer, Liverpool (a pupil of the late Mr. John Thomas), was selected, the committee appointing him to carry out the work of erection at once. This he is now doing.

The accompanying engraving represents the north-west view of the chosen design, which takes the form of a clock tower, 65 feet in height. The style is Perpendicular Gothic.

The memorial, now considerably advanced, is

THE PRINCE CONSORT MEMORIAL, HASTINGS.—Mr. Edward A. Heffer, Architect.

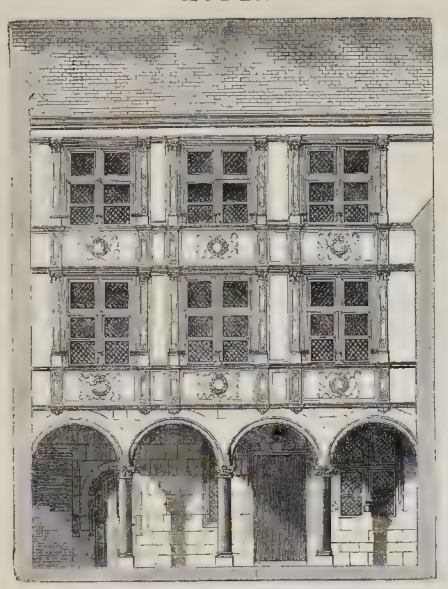
situate at the Priory, at the junction of seven streets. The borough arms will be carved upon a shield in panel above the doorway; "Albert the Good" being inscribed in bold raised letters on ribands.

A polished red granite drinking-basin will be fixed in a panel on the east side of the tower.

The capitals of the octagonal shafts at the angles of basement will be richly carved with oak, vine, and other leaves.

The statue, of Portland stone, will represent the Prince Consort in the robes of a Knight of the Garter, and will be supported by an octagon pedestal of elaborate design.

The cornice below the clock chamber, 2 feet 5 inches deep, will be supported by eight carved corbels, and the capitals of angle columns, the caps being 9 inches in diameter at necking, and carved.

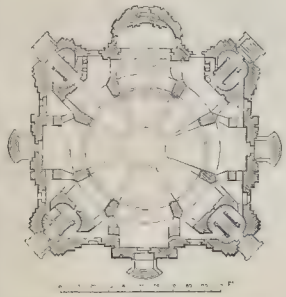


The dials, 4 feet 6 inches in diameter, are intended to be illuminated at night. The panels below will be filled in with the arms of his royal highness.

The bell-turret, with louvres of stone, rises above the clock chamber, and is surmounted by spire and vane, the latter having the royal initial "A" pierced through, and gilded.

The staircase, of forty-four steps, is of Yorkshire stone; the rest, excepting the statue, entirely of Bath stone. The door is of oak: the ironwork is wrought and painted. The diameter at base is 15 feet; the height, as already mentioned, 65 feet.

The contractors are Mr. Edwin Stirling, of Liverpool, and Messrs. Cowley & Pattenden, of Hastings.



MODERN STYLES OF ARCHITECTURE.*

THE INTENDED PUBLIC OFFICES.

Correspondents are expressing their astonishnt at the slow progress made with the works for intended public offices at Whitehall, and the ence of information on the subject. No one ows what is proposed, or *when* it will be done. e, "An Official," writes—"The public look to , Mr. *Builder*, to enlighten them on the subject, to press on the works, that the rents now paid the country for insufficient, shattered, and ly-situated offices, may stop. Is Mr. Scott crastinating in hopes of Lord Palmerston's ng "out" sooner or later? or does he set his life inst his lordship's? The architect's heart not be in the work!"

THE LATE MR. CHARLES WILSON, ARCHITECT, GLASGOW.

At the last meeting of the Glasgow Architecal Society, Mr. Salmon gave some particulars of life of Mr. Charles Wilson, late President of t Association. He said,—The eminent position ich Mr. Wilson occupied as an architect, not y in this city, but in Scotland, would of itself e insured, in the contemplation of his decease, liveliest interest. But when to his eminence an architect we add the unassuming kindness his disposition, the willingness with which he ered into every proposal for the elevation of hitecture, and the prominent part which he k in the establishment of the various architecal societies of Glasgow, we truly feel the greats of the loss which, in his death, the profession sustained. So far as I have learned, Mr. lson commenced his studies as an architect in office of the late Mr. David Hamilton, someere about the year 1827 or 1828. His progress a student may be gathered from the fact that in or three years after serving his apprenticeship commencing business for himself, he had uired sufficient talents and information to alify him for undertaking some of the most imtant works in this city and neighbourhood. e Lunatic Asylum, with so many marks of ture thought and knowledge in its composition, one of his earliest works, having been comnced about the year 1842. Following this, in id succession, when his youth is considered, we d him engaged in the erection of Lewis Castle, sgow Academy, Shandon House, the Southern cropolis, St. Peter's and St. Stephen's Free urches, Royal Bank Buildings, Buchanan-eet; Nelson Institution, Paisley; West End rk, with its stairs and terraces; Faculty Hall, een's Rooms, Free Church College and College urch, Rutherglen Town Hall, and Eastwood rish Church, not yet finished. Besides this , however, which embraces only a part of . Wilson's more important works, we know t he erected in all parts of the country a very at number of churches and first-class mansions, ry one of which exhibits some mark of his hly-cultivated taste and good advancement sthetic feeling and constructive skill. With ard to the merits which may be justly claimed his works individually, this is scarcely the e to refer. The memory of our departed bror has, for the time, too strong a hold upon our ctions as a friend to permit our thinking or aking of him in almost any other light. His tle manners, his readiness to help and advise, entire freedom from professional jealousy or le, and his other amiable qualities enlist our pathies far too deeply to permit us, with the so recent, to take up with sufficient calmness cooler work of critical animadversion. Let it fice in the meantime that I remind you that talents, naturally of high order, had been cultated and refined by great research and unusual ustry;—that to readiness of conception and ility of hand, he joined a correctness of taste ich has imparted a decidedly pleasing aspect to great majority of his works;—and that, as a eral reflection, we cannot but allow, in one en away so comparatively young, that there e been few architects whose productions will ter stand the investigations of the critic. Mr. lson does not seem to have been wed too exclu-ly to any one style; though, if there was a bias, was probably in favour of Free Roman Italian. this style we find some of his best works, such he Faculty Hall, the Queen's Rooms, and the e College. On the other hand, however, we d him with equal success producing the Gothic rches of St. Stephen's and St. Peter's, and t Scotch baronial edifice, the Rutherglen Town-. The younger members of the profession now ent may advantageously take a lesson as well from his great success in the profession, as from the equally great industry by which it was accomplished. Without a metropolis to encourage his energies, or titled friendship to open the doors of patronage, we find our deceased brother, year after year, rearing new trophies of his skill, trophies—as they should do—increasing as much in number as in excellence, and indicating by no means faintly, what a still higher position he would have attained had he lived to develope the fuller maturity of his talents.

PROPOSED DESIGN FOR THE BENEVOLENT ASYLUM, DUNEDIN, OTAGO, NEW ZEALAND.

The design selected is by Mr. R. A. Lawson, architect, Dunedin. It is Late Tudor in style, to be built with red bricks and stone dressings. The wing to be presently erected is to cost 2,000*l.*; the whole building complete, 8,000*l.* The wing is to accommodate fifty persons; the whole building, 150, with suitable offices, yards, and accommodation.

The site overlooks Dunedin Harbour and town, and is a Government grant to the institution.

ALDEN'S TYPE SETTING AND DISTRIBUTING MACHINE.

The Americans seem determined to supersede the present mode of type setting and distributing. Another new machine is described in the *Scottish American Journal* of New York. This machine is said to be superior to Mitchell's, Young's, or any other. Eighty machines have already been sold,—the *New York Herald* and the *New York Times* each ordering twelve, and several other New York papers having it now in use. The type setting and distributing are both carried on by one machine, and can be both worked at one and the same time. Ordinary types can be adapted to the machine by merely being nicked in a particular way, and the proper types are said to be cheaper than ordinary types. The machine is said to almost do away with proof reading. The cheapening and improving of papers and books is contemplated by our go-ahead cousins rather than the throwing of compositors out of work; and indeed, if a really practicable machine be got, the whole history of machinery proves that the number of compositors employed may largely increase instead of being diminished. Alden's machine is said to do the work of twelve compositors by means of two; and all the different characters and spaces required in both book and newspaper work can be set up or distributed by the machine. The general appearance of it is that of a large semicircular table with horizontal wheels in the centre, surrounded by radiating grooves and other apparatus, with key-boards at the straight end of the table, which seems to admit of the compositor being comfortably seated.

MAPS OF METROPOLITAN RAILWAYS.

Maps have been published by Mr. Sandford, of Charing-cross, and Messrs. Vacher, of Parliament-street, showing the various proposed railway and other plans brought before Parliament in the present Session; also the railways sanctioned and in operation. Mr. Sandford's lines are marked on a plan of London, showing all the town; Messrs. Vacher's on a skeleton map, showing only the leading streets. They must interest a large number of persons. Public attention is now awakened to the damage with which the metropolis is recklessly threatened, and it may be hoped that careful consideration will be given to the various schemes, so that a satisfactory result as a whole may be obtained. An officer of the Board of Trade has been instructed to inquire into the various schemes and report on them, and this report will be brought before the House. A committee for the purpose would have been better.

FRANCE.

One of the most interesting modern edifices, of Paris, in an historical point of view, the barracks of the Rue de Tournon, is undergoing a thorough repair externally and internally. This mansion was built in the seventeenth century by Concino-Concini, who, coming into France with Marie de Medicis, was all-powerful after the death of Henry IV.; and became, as Voltaire has remarked, a minister without knowing the laws of the kingdom, and a marshal of France without ever having drawn a sword. At that period the "Hôtel de Tournon" was the most sumptuous residence in Paris; thus, in April, 1617, when it was given up to pillage after the death of Concini, who had been assassinated at the Louvre by the king's order, 200,000 crowns' worth of jewels were found in it. Falling then into the hands of the new favourite, M. de Luynes, it was, from its proximity to the Luxembourg, inhabited by Louis XIII., who wished to be near his mother. Under Louis XIV. this residence was used as a house of reception for foreign extraordinary ambassadors during the three first days which followed their reception. Before being presented to the king they alighted at the Folie-Rambouillet, a country seat then situate *extra muros*, and of which some vestiges remain in the Rue de Charenton: after the official introduction they were conducted to the Hôtel de Tournon, with all the court ceremonies and the *cortége* of welcome in those times. Thus there were lodged from time to time many notable personages and representatives, such as the ambassadors of the king of Siam, of the Czar of Moscow, those of the Order of Malta, &c. In the time of Louis XV., Mancini-Mazarini, Duc de Nevernay, obtained this residence in exchange for the Hôtel de Pont Chartrain, and died there. Under the Empire it was occupied by the Councillors of State controlling the national domains. At the restoration, it was given to the Duchess Dowager of Orleans, widow of Philippe-Egalité. In 1830 it was converted into barracks for the Municipal Guard.

The French administration, convinced that the cheap transport of merchandise can only be effected by water conveyance, have started in all parts of France, we learn from French journals, works of importance to ameliorate all the navigable channels of communication; and those lines in contact with the capital have received every attention. Among these we may mention the great canal uniting the Seine with the Rhine, from Strasbourg to Havre, and consequently between Mulhouse and America—a most important commercial enterprise. The works of this canal, which is principally formed by the canalisation of the Seine and the Marne, in the fraction lying in the communes of Saint-Maurice and Charenton, have met with delays, occasioned by the presence, at the junction of this part with the Seine, of a subaqueous boulder, of formidable dimensions, which it was necessary to remove by breaking it into small fragments before the piles could be driven: at length this obstacle was removed and the concrete foundation was enabled to be laid for the last lock of the canal. The height to which the waters of the Seine have now risen has prevented the works from making further progress.

In order to facilitate the execution of this canal through the midst of the several islands in the river Marne, above the Pont du Charenton, it has been deemed necessary to throw into it the portion below the bridge of the smaller arm of the stream. As to its upper part, through the village of Saint-Maurice it was proposed to fill it up, but that could not be done on account of the several mills worked by it; therefore it has been left untouched as far as the lower part of the Moulin Saint-Maurice, the point where it turns to the left into the Marne by passing under the canal; and the rest has been filled in. An aqueduct here carries the canal over the river.

This fraction of the Seine and Rhine canal forms a portion of the section comprised between Charenton and Dizy, near Epernay. The surveys for another section between Vitry-le-François and Saint-Dizier have been partly approved, and the first lot was contracted for last summer.

On the Haute Seine, between Paris and Montereau, twelve weirs furnished with sluices are being constructed, in order to substitute a regular navigation on a constant level of water to that intermittent service, by numerous locks, which has subsisted for a great many years. Three of these barrages are completed, and the remaining nine are far advanced. On the Yonne eleven similar works are to be established, in order to continue as far as La Roche, the point of affluence of the Burgundy canal, the system of navigation adopted in the Haute Seine.

In the Lower Seine, between Paris and Rouen, the works of the Andresy dam are terminated: those of the Marlot supply canal are being actively pushed forward; and below Rouen, the prolongation of the *digues* of the Basse Seine, between Tancarville and Larogue, has been attended with satisfactory results.

Considerable works have also been undertaken to improve the state of existing canals in France. They are now being carried on at the Canal du Centre, that from Nantes to Brest, those of L'Ille

to Rance, Blavet, the Ardennes, Calais, the Somme, Les Etangs, and from Arles to Bouc. They consist principally in deepening, widening, &c. Indeed, it would appear that all the grand aquatic lines of communication in France are likely to be now brought to perfection by the application of all modern improvements; and to this end considerable sums of money are to be devoted.

COMPETITIONS.

Freemasons' Hall.—Sir: Last week your journal contained an advertisement offering premiums for designs for the improvement of the Freemasons' property in Great Queen-street, Lincoln's-inn-fields, for which I felt disposed to become a competitor, on the assumption that the architect of the best design was to superintend the work.

But, to my great surprise, I found on inquiry that the architect would have to be satisfied with the premium offered, as the committee have no power to employ any one but the massive officer known as the "Grand Superintendent of Works;" in proof of which I was referred to the following extract, taken from folio 39 of the "Book of Constitutions:"—

"The Grand Superintendent of Works is to advise with the board of general purposes on all plans of buildings or edifices undertaken by the Grand Lodge, and furnish estimates; he is to *superintend their construction*, and see that they are conformable to the plans as approved. He is, at the first meeting of the board of general purposes in every year, to report on the state of repair of the edifices of the Grand Lodge, and make such further reports from time to time as he may deem expedient."

I would, in conclusion, state that the office of "Grand Superintendent of Works" is filled by an architect of considerable ability and standing in the profession; and that the "Book of Constitutions" contains the laws by which the Masonic body is governed.

A. B.

Hall, Tunbridge Wells.—The shareholders of the new Public Hall, at Tunbridge Wells, have selected, from many others, the design of Mr. Jas. Wilson, F.S.A., of Bath. The building is to cost 6,000*l.*

Florence Cathedral Façade.—The first three premiums have been withheld. The three minor prizes have been given, in order of merit, the first to No. 42, the design of Signor Carlo del Conte Lorenzo Cappi, of Turin; the second to No. 25, by Signor Mariano Falcini, of Florence; the third to No. 38, by M. Wilhelm Peterson, of Denmark. The designs numbered 28, 29, 34, 22, 31, 37, have obtained honourable mention, and the judges await the consent of the architects to make their names public. The judges consider the competitive prizes as failures; but they promise to do their utmost to promote a future competition for the purpose of obtaining a worthy design for the completion of the Duomo.

PROVINCIAL NEWS.

Hertford.—The New Waterworks at Hertford have been opened. They have been completed at a cost within the amount of the original estimate. Mr. Gravatt and Mr. Bailey, the engineers; Mr. Bugbird, the contractor; and Mr. Horne, the maker of the steam engine, were present, with members of the Corporation, at the opening. The engine-house is at Port-hill. The reservoir contains a depth of between nine and ten feet of water, contrasting pleasantly with the river water, which for so many years has been supplied to the town. The experiments made with the hydrants at various points of the town, according to the local *Mercury*, were satisfactory.

Sedgley (Staffordshire).—A temperance hall has been erected here. The building is intended, when fully completed, to combine, in addition to a large room, accommodation for a ragged school, library and class-rooms for the purposes of a Mechanics' Institute and a Working Men's Club. At present, only the lecture-hall is completed, but a room on the ground floor for ragged schools will soon be ready for use. The erection of the remaining portion of the building is to be deferred until the necessary funds can be raised. The architect of the building, which, so far as the works have gone, is of plain construction, is Mr. W. Bourne, of Dudley, and the contractor is Mr. John Hilton. The site is a piece of land adjoining Townsend House, facing the Wolverhampton and Sedgley Turnpike-road. The now vacant space in front of the hall will be occupied by a building proposed to be used as a Working Men's Club. Some spare land at the back of the hall will be available as a recreation ground.

Bristol.—A lofty chimney-stalk has been run up in the rear of Redcliff-street, for Messrs. Baker & Sons, the extensive millers and corn-factors. The firm have also erected for their steam flour-mills a massive block of buildings which now forms one of the prominent objects on the banks of the harbour. The structure is built on an area of 83 feet by 57 feet; and in order to get a foundation, the builders had to sink 27 feet below the water level, and consequently the edifice rests on a foundation of concrete 27 feet deep. It has been built of Hanham stone, and runs up to a height of 85 feet, the walls being about 3 feet thick. The large warehouses are capable of receiving and storing 10,000 quarters of corn; and running through each story are huge beams, secured at each end by stout iron bars. Through the centre of the structure the massive chimney-stalk has been reared to a height of 130 feet. It is built nearly square, the base being 11 feet by 11 feet 6 inches, and the top 10 feet 6 inches square. Round the summit a freestone facing has been fixed by iron bars and stanchions, and the surface is capable of seating eighteen persons. The first 30 feet of brickwork are 2 feet 3 inches thick, and for the remaining 100 feet the brickwork is 2 feet thick. The architect was Mr. Hirst, and Mr. John Harry acted as foreman of the works.

Swansea.—The scheme to provide a large public hall for Swansea has virtually succeeded, according to the *Cambrian*. The committee have already received 2,400*l.*, or rather have allotted 2,400 shares of 1*l.* each, and the remaining portion has been promised. The transfer of the ground is being legally prepared, and some five or six plans of the building have been received. Most of the designs, it is said, fulfil the requisite conditions, viz., a large room capable of containing about 2,000 persons, with refreshment rooms, orchestra, &c., complete. The cost being limited to 3,000*l.*, of course no very great architectural display has been aimed at.

SCHOOL-BUILDING NEWS.

Loughton (Essex).—These schools, with teacher's residence, of ornamental and pictorial character, in Early English, are to be carried out at once, at a cost of about 1,300*l.* Mr. Thomas Henry Watson is the architect. Enlarged schools have long been wanted in this now populous neighbourhood.

Peckham. — The Collyer's Memorial Schools, Peckham, are now roofed. The architect is Mr. J. G. Stapelton, jun. The contract for the works was taken by Mr. Thomas Rudkin, builder. The school is a parallelogram, 65 feet by 32 feet, proposed to be divided by a movable partition; at one end there is a raised platform at a level of 3 feet from the floor, surmounted by a brick niche. At the back of the school there are an infant school, two class-rooms, and a waiting-room between. One side of the school fronts to the high road. In the centre of this front there is a transept with two porches, one on each side. The details are worked in stone, and red and black bricks.

Wheathamstead (Herts).—The national schools have been opened. The Dean and Chapter of Westminster, lords of the manor, granted the piece of waste ground called Bury-green, adjacent to the rectory and the church, for the purpose of building the schools thereon; and it was resolved to make the building to accommodate 200 children, with residence for a master and mistress. The estimate of Mr. Browning, of Stamford, architect, amounted to 1,000*l.*; and a contract was entered into with Mr. E. Young, of St. Alban's, builder, who has completed his contract. The building is faced with black flintwork, contrasted with white Arlsey bricks. Extra charges beyond the contract raised the sum to 1,200*l.*

Stafford.—Two additions have been made to the Grammar-school building recently erected near the Newport-road. The first consists of cloisters erected at the west end, which will afford a place for shelter in wet weather. At the back of the school, with an entrance from the cloisters, a temporary chapel has been erected. It consists in the framework of iron pillars, and is lined with wood outside and inside to a certain line, above which canvas forms a sort of panel between the ribs. The space between the inner and outer skins of the building is to prevent the rapid radiation of heat. Outside, the building is not very attractive. All the fittings are of deal, stained. The chapel and its fittings were designed by Mr. Robinson, architect.

Southampton.—The Peninsular and Oriental Company's new schools, at the junction of Albert-road with Anglesea-terrace, are now completed, and consist of schools, class-rooms, recreation-grounds, &c., for children, with residence for the master and mistress, and reading-room and library for the *employés* of the company. The building is of Domestic Gothic character, and is built of red bricks, with black mortar joints, Bath stone dressings, coloured brick cornices, and string courses. It is inclosed by an ornamental iron fence, with white brick piers and stone moulded caps. The boys' and girls' schools are situate at the two extremities of the building, each being 65 feet by 30 feet, and having open timber roof of light design. Connected with the girls' school is an infant school, 40 feet by 20 feet; also a class-room for pupil teachers. The master's house is situate between the schools, having ready access with either, and also with the reading-room, 40 feet by 20 feet, situate on the first floor, and approached by a staircase from the principal entrance, connected with which is the library; also, a lavatory and other offices. Each school has a separate entrance, with cloak-rooms and lavatories attached, distinct from the principal entrance under the tower, giving access to the house and reading-room. The porch has stone moulded arches, and shafts supported on carved masked heads, representing art, science, trade, and navigation, and is paved with encaustic tiles, from the Architectural Pottery Company, Poole. The whole has been executed by the contractor, Mr. S. Stevens, from a design by Mr. W. H. Mitchell; the superintendence of the work having been intrusted to Mr. D. Geddes. The building is heated by hot water, and lighted with gas, the arrangements having been made by Mr. Geddes, and the work executed respectively by Messrs. Kent & Dain and Mr. George Hornsey. The clock has been supplied by Mr. A. Pegler, and the ground in front laid out, turfed, and planted, by Mr. A. Oakley.

Manchester.—St. Margaret's Church Schools, Whalley Range, erected in Cornbrook-street, Chorlton-road, have been opened. The two schools can be thrown into one. They were built from the plans of Mr. W. W. Whitaker, of Manchester, and are intended for Divine service on the Sunday, as well as for educational purposes during the week. The boys' room forms the nave, and the girls' the transept. There are also two class-rooms, and a third room, which will be used as the library and vestry. At the upper end of the building is a good-sized chancel, in which is a stained window, the gift of Mrs. H. B. Jackson and her daughters, from the design and workmanship of Mr. Edmundson, of Manchester.

STAINED GLASS.

East Dereham Church.—A memorial window to his father and mother has been erected in this church by Captain H. Gillett Gridley. The subject of the window, which is in the south side of the chancel, is the "Te Deum." In the tracery are the figures of St. Withburgha, to whom the church is dedicated, St. Augustine, St. Edmund the Martyr, St. Witham of the Wood, St. Thomas of Canterbury, St. Woolstan, St. Ethelberga, and St. John the Baptist. The inscription below is on freestone, inserted into the wall, the letters being deeply incised and filled in with coloured cement. The work was done by Messrs. Heaton, Butler, & Bayne.

Dartford Church (Kent).—The chancel of this church has recently been restored by Mr. Blomfield, and the large east window filled with stained glass by Messrs. Heaton, Butler, & Bayne. It has five lights, and the Crucifixion occupies the three centre ones. Around this are the beatitudes illustrated by the following subjects:—Blessed are the Poor in Spirit; Angels appearing to the Shepherds; "They that mourn;" the Holy Women at the Tomb; "the Meek;" Nicodemus "Hunger and Thirst;" the Adoration of the Magi; "the Merciful;" the Good Samaritan "the Persecuted;" Peter released from Prison "the Pure in Heart;" the Annunciation. The ornamental parts of the window are richly coloured, and on white grounds. The back grounds of the subjects are a subdued grey blue. The reredos, also by Heaton, Butler, & Bayne, is alabaster, incised with emblems of the Evangelists, and with a cross in coloured marbles in the centre.

Southwater Church.—A stained glass window has been placed in the middle compartment of the last or chancel window of this church by the incumbent, the Rev. A. H. Bridges; and it is hoped that, with assistance, the entire window may be converted into stained glass. The part already done is commemorative of the institution of the Last Supper, and the Crucifixion of our Saviour; the work has been intrusted to the same artist that executed the front window.

Wilmslow Church.—Messrs. Lavers & Barraud, ys the *Manchester Courier*, have on view a five-ht stained-glass memorial window for Wilmslow urch. The centre light represents our Saviour; d the other subjects are Joseph and Mary; St. hn, with the emblem of the eagle; St. Agnes, th the lamb; and the dispute with the doctors. e panels and canopies are filled with foliated nament. By the side is shown a small window Eccles church, representing in an emblematic le the text, "The righteous shall flourish like a m-tree."

CHURCH-BUILDING NEWS.

Ipswich.—Some important alterations to St. ry's Tower Church are in progress. The chancel he only portion of the present structure which l be allowed to remain, and even that will be siderably improved at the points of junction h the other portions of the church, by the noval of some semi-arches on each side, and by reconstruction of the principal arch dividing chancel from the nave. In all other parts of the lding, changes, restorations, and improvements l be made of such an extensive character that n they are entirely completed the church will almost renewed. All the windows in the north south aisles will be renewed in the Decorated le of English architecture, and the walls will rebuilt in hammered flint and stone in alter-e squares. The tower will be rebuilt, carried ew feet higher, and surmounted by a spire feet high. In the interior, except the columns pointed arches which separate the nave from aisles, nothing will remain in the body of the rch as at present. The pews will be replaced benches, and the present roof will be renewed ak. The design of the roof is of the Decorated od, and it is divided into compartments by beams which stride the nave and rest upon ed stone corbels on each side. The edges of e principal timbers and of all the beams are cut mouldings of an elaborate character; and d the roof of the clerestory, just below the lows, runs an oak cornice of considerable h and bearing an elaborate pattern. This cor-will be one of the most noteworthy features he church. These extensive alterations will mmenced immediately, and will occupy about years. The new designs are by Mr. R. M. son, architect, and Mr. Robert Smith will be uilder.

Idershott.—A new church for the accommoda-of the troops is fast approaching completion. imensions are 140 feet by 70 feet, and it is lated to seat 1,200 persons. It is constructed ick, with Caen stone dressings, and the cost ection is estimated at 16,000*l.* The architect . Hardwick, of London, and the builders are rs. Myers & Sons.

uth Collingham.—With reference to the allu-n our last to the necessity there was for the mittee to take the work into their own hands, nsequence of the bankruptcy of the builder, Fox; Mr. J. H. Hakewill writes,—"I think it justice to Mr. Fox to say that the works almost entirely completed before this neces-ccurred; and they have been, on the whole, executed."

ulton (Somerset).—The church here has been ed. The whole aspect of the building has changed, and, under the direction of Mr. n, it has assumed an appearance more in ng with what a parish church should be. nterior has been redecorated, the old pews ed, and open seats provided. A new chan-d organ chapel take the place of the old , and the gallery is now devoted to the modation of worshippers. The chancel is ratively small. It is paved with Minton's stic tiles, and the steps are of Kilkenny e. The chancel has an open-timbered roof, rted by six arches. The chancel has not yet completed, and it is intended to illuminate eredos in a manner which will harmonise he stained window above it, and the other ws in the church. The chancel was origi-lighted by a window of stained glass, of a imple pattern. This has been removed and at the opposite end, although its effect is by the gallery. The east window of the has been provided by the vicar and his , and was done by Messrs. Harwood, of . It is a three-light window, the lower presenting the sufferings of Christ, depict-e Crucifixion, the Entombment, and Resur-, with many minor figures. The upper represents the Ascension and Glorifica-the Son. There are many other subjects vices introduced. On the north side of the chancel is a small stained glass window, by Mr. Bell, of Bristol, representing the Nativity and Presentation. The window was presented by young men who had been educated in the Paulton schools, and the contributions were sent from all parts of the kingdom. Three stained windows have been placed in the north side of the building. These windows represent six of the Apostles—St. Paul, St. Peter, St. Luke, St. John, St. Mark, and St. Matthew; and it is hoped to provide three windows for the south side, which will represent the remaining six Apostles. These windows were presented by Mr. Hill, Mr. Joseph Hill, Mr. Evans, and Mr. Thomas Hill. One is a memorial window. The organ is placed in the chapel on the south side of the chancel, and it has been redecorated, and some carved work added. The pulpit is of freestone, octagonal in shape. The work, with the other carving, was given to Mr. Clarke, of Wells, but he died before it was completed, and the task was finished by his brother. Mr. Durke, of Chew Stoke, was the general contractor; the mason's work being executed by Mr. Hinks, of Paulton, and the iron-work by Mr. Singer, of Frome. The estimated expenditure is about 1,000*l.*, a portion of which is still to be provided for.

Yarkhill.—The parish church of Yarkhill, about six miles from Hereford, having undergone a restoration, at an outlay of 1,000*l.*, under the superintendence of Messrs. Ainslie & Blashill, of London, architects, has been re-opened for divine service by the Bishop of the Diocese. The builders were Messrs. Niblett & King, of Gloucester. New open seats have been provided, and accommodation for 216 persons, being sixty-one additional seats, one-half free. On each side of the communion-table is an oak abbot's chair. These, the pulpit, and the reading-desk, are made out of some very fine old oak, at least 600 years old, taken from the ancient church at Coaley, which Mr. Niblett restored some years ago. The style in which the alterations have been carried out is consistent with that of the latter part of the thirteenth century. The work is generally plain and massive, the ornaments being obtained chiefly by chamfered piercings in the woodwork, and by carved corbels and terminations to the label mouldings; these were executed by Mr. Henry Frith, of Gloucester.

MEMS. OF THE MOMENT.

An Arch Compliment.—For the decoration of the central arch of Lendal Bridge, York, the head of an angel has been needed; and delay ensued in consequence of the difficulty of obtaining a model which sufficiently came up to the idea of what the head of an angel must be. A model was sent from London, but the contractors did not like it, and asked leave to "wait a little longer." The other day the solution of the difficulty flashed upon them. They called in Mr. Tweedy, of York, and sent him a photograph of the Princess Alexandra to model from. The work is now complete, ready for casting, and seems to please everybody. A lucky thought, Messrs. Hawks & Crawshay!

"The Norwich Gates."—A subscription has been commenced in Norfolk to purchase the "Norwich Gates," which formed a prominent object in the International Exhibition, in order that they may be presented to the Prince of Wales, and placed at the entrance of Sandringham-park. General Knollys, accepting the gift for the Prince, says,—"Such a mark of loyalty and respect from a county which his Royal Highness considers himself fortunate to belong to, in regard to his property, cannot but tend to cement the bond which already exists between the Prince of Wales as a landed proprietor and his neighbours and the inhabitants generally of the same county."

Bust of the Princess Alexandra.—Mrs. Thorneycroft, of Wilton-place, Belgrave-square, has just completed an excellent bust of the Princess Alexandra, for which her Royal Highness lately gave sittings to Mrs. Thorneycroft. This bust, which is the more interesting as being the only work of art for which the Princess has sat in England, displays both vigour and delicacy. The right to the reproduction of the bust in Parian has been accorded, with her Majesty's gracious permission, to the Art-Union of London.

St. Paul's Cathedral.—The suggestion made in our pages and elsewhere, that the dome should be illuminated on the 10th inst. is to be carried out by means of Professor Pepper and the electric light. An enterprising firm in the "Yard" will, at their own expense, light up the west end of the Cathedral by similar means.

Fittings on the Line of Procession.—Intending occupants on the 7th should turn up the red calico and see what carries the seats. The "district surveyors," on whom the *Times* calls for protection, have no power in the matter. The decoration of London Bridge promises to be very effective. Of this, however, hereafter.

ALBERT MEMORIALS.

Bath.—The Albert Memorial Fund was to be closed on the 28th of February. The sum collected it is hoped will be sufficient for erecting the additional building to the Bath United Hospital.

Yeovil.—The inhabitants of Yeovil subscribed last year nearly 500*l.* towards the erection of a memorial of the Prince Consort. The subscribers decided that it should be in the form of a stained-glass window, which should be fixed at the west end of St. John's Church. The gentlemen to whom the carrying out of the wishes of the subscribers was deputed, have succeeded in obtaining a handsome window fixed over the new western door. The work has been executed by Messrs. Hardman. The following are its inscriptions:—"To the Memory of the Prince Consort Albert, this Window was set up by the inhabitants of Yeovil, A.D. 1862." "Whatsoever things were true, whatsoever things were just, whatsoever things were pure, whatsoever things were lovely or of good report, he thought on those things, and had grace to perform them.—Phil. iv. 8." There is also a tiled floor, by Minton, immediately underneath the window, in the centre of which are displayed the Arms of the Prince.

SANITARY CONDITION OF GIBRALTAR.

We observe from the *Gibraltar Chronicle* that this subject is exciting local attention. The editor, in a leading article, commends it to the attention of his readers as one of literally vital interest. A city with a death-rate of 31 per 1,000, and the inhabitants of which are not engaged in occupations which necessarily shorten life, must be a very dirty one. And Gibraltar is, in truth, a dirty place, with many disease-producing nuisances, and with an atmosphere which is often foul, and seldom so clean as it should be. With a considerable population closely packed on one side of a steep and high rock, and with houses constructed on the Moorish-Spanish system of the *patio*, thorough and satisfactory ventilation must always be difficult, and, indeed, impossible. Still a great deal might be done, the doing of which would, as a matter of absolute certainty, reduce the death-rates of future years. Attention is especially pointed to what might be done in improving the water-supply, and trapping and ventilating the drains.

THE METROPOLITAN SEWAGE AND THE ST. OLAVE'S DISTRICT BOARD OF WORKS, SOUTHWARK.

The following important resolution was *unanimously* agreed to at the meeting of the Board, on Tuesday, the 3rd inst.:—

"That this Board, recognizing the fact that the sewage of the metropolis is the property of the ratepayers, and is of enormous value as a source of agricultural manure, desire to press upon the Metropolitan Board of Works the importance of the mode in which it is dealt with.

The evidence taken before the select committee of the House of Commons upon town sewage having established that the greatest results follow from its moderate application over an extended area of land, the Metropolitan Board of Works should, in the opinion of this Board, contemplate and provide for its future utilization in that manner, or both the return to the ratepayers and the advantage to agriculture would, according to that evidence, be jeopardized or lost."

And that a copy of this resolution be presented to the Metropolitan Board of Works by our representative; and that copies be also sent to the various local boards or vestries of the metropolis, requesting their co-operation in this important social question.

THAMES EMBANKMENT COMMISSION.

The Commissioners appointed to

"consider plans for making a communication between the embankment at Blackfriars Bridge and the Mansion House, by means of a new street in a north-easterly direction from the termination of the embankment roadway near Blackfriars Bridge, or of an extension of the embankment to the eastward of Blackfriars Bridge, or otherwise; and also plans for uniting the intended embankment at Westminster Bridge with the existing embankment at Millbank, and also to consider the advantages and cost of the different plans that may appear to them to be calculated to relieve the over-crowding of existing thoroughfares, and to conduce to the convenience of the public and the embellishment of the metropolis,"

have made their report. At the close of it they thus recapitulate its several recommendations:—

"1. That the road from Blackfriars Bridge to the Mansion House, as proposed by the Commission of 1861, be carried into effect.

2. That it is not desirable to enlarge the embankment in front of the Houses of Parliament.

3. That the space between the Victoria Tower and a parallel line with Wood-street be opened out, an embankment to this extent of the river formed, and a row of houses of first-class character erected at right angles with the river, and looking upon the open space between them and the Palace, Millbank-street being widened and improved.

4. That all the houses in front of the Chapter-house and Chapter residences be removed, as shown by the plan of Mr. G. G. Scott, attached to this report.

5. That the approach from Victoria-street to the Houses of Parliament and law courts be carried through the inclosed ground to the north-east of St. Margaret's Church.

6. That the plan for widening King-street be carried into effect."

The estimates of the various improvements recommended are previously stated thus:—

"New street to the Mansion House and Blackfriars Bridge, 460,015*l.* net.

Widening and improving Millbank-street and the road beyond, 157,986*l.* net.

Improvements in New Palace-yard and Abingdon-street, 214,182*l.* net.

Widening King-street and improving the southern approach, 78,552*l.* net.

These estimates show the ultimate cost of the various improvements; the first outlay will be much larger, as will be seen in the evidence and reports.

With regard to the mode of defraying the cost of these several improvements, we are of opinion that the removal of the houses adjoining the Abbey, and of Abingdon-street, as well as the purchase of the wharfs and houses south of the Victoria Tower, and the embankment of the river, being for the convenience, embellishment, and safety of that national edifice, the palace of the Imperial Legislature, as well as the approach to the Houses of Parliament from Victoria-street, ought to be a charge upon the Imperial Treasury; but that the other recommendations of our report, viz., the new street from Blackfriars Bridge to the Mansion House, and the widening of King-street and Millbank-street, may fairly be considered metropolitan charges, as they are required for the accommodation of the metropolitan traffic."

The report is signed William Cubitt, Joshua Jebb, John Thwaites, Douglas Galton, Edward Barstal, Henry A. Hunt, John Robinson McClean, William Tite. Henry Kingscote, Secretary.

SIR,—I have read with perfect astonishment this day the report signed by Mr. Tite and other commissioners, respecting the approaches to the Houses of Parliament and Westminster Abbey, &c., wherein they recommend, instead of pulling down the island of houses at the end of Whitehall, that Old King-street shall be widened, so as to give a second street from Whitehall southwards. Now, in every improvement commission that we have heard of, and in the plans of all the architects who competed for the new Public Offices in 1857, it was taken as a leading fact that this island of houses should be removed, so as to give a fine view of the Abbey from Whitehall, and a good frontage to the new offices to be erected. It need hardly be pointed out that, as now proposed by these commissioners, the new public offices will look upon the old decayed and dirty houses in King-street, the smoke of whose chimneys will of course be very agreeable to those members of the civil service who will occupy the upper stories of the new buildings. It seems to me, nothing can be more petty, and at the same time more preposterous, than this project, and I for one trust that, before any action takes place in the matter, it will be treated by the House of Commons and the public as it richly deserves.

A BUILDER.

BAZAAR BRIDGES.

As though actuated by spasmodic uneasiness from long forbearance of privation of free intercourse in a city which is becoming every year more populous and wider in extent; architects, engineers, and surveyors have by a common impulse projected and published no less than twenty-four schemes for railways, and others for bridges, within the bills of mortality.

The commentaries of the press on the congested condition of traffic and the frequent allusions to the subject in the *Builder*, have exercised no small influence on the public mind in these particulars; therefore, now that so many schemes have been launched "*ad un tratto*," the restraining power of printing monitors has become not only a necessity, but a duty.

There can be no question but that the majority of lately-projected railways from all sides and through the heart of the metropolis, will prove a relief to travellers and an incalculable benefit to commerce at large; but there are some strong and palpable points of objection to several of them which have been resisted by residents of the quarters threatened with subversion and mutilation, by the remonstrances of Parliament, and by the leading journal of England.

As intercommunication by rail has now become an irrepressible necessity, so in the plethoric condition of London increased facilities for free traverse of the river can no longer be delayed. Often has the *Builder* referred to the vital importance of throwing open the existing toll bridges free to the public. Now, it appears that several additional toll-bridges are to be built, while as yet there is no movement towards that emancipation and easement which our social condition stands so much in need of.

The liberation from toll of *one bridge only* (Waterloo) would be a greater boon to the multitude than all these projected novelties summed together. Take the numbers who cross the two bridges at the extreme ends of the metropolis: compare these with the few stragglers who daily cross Waterloo Bridge, in the very heart of population and commerce: they will not be one for every hundred. This proves to demonstration that, by however short an approach the way may lead to business or home, the community will not frequent it; but that they will rather waste time and labour in taking a circuit of two or more miles; besides that the imposition of ever so small a charge, even one halfpenny, has the effect of depressing, depopulating, and reducing a whole quarter (and that the most vicinal and important one) to comparative desuetude. What may be the value to the State of only one hour per diem abated from the active occupation of say 200,000 daily passengers by a bridge?

The traversers may not see it in this light, and it may be said that they are the best judges of the value of their own time and labour. But this is not a just test, for the industry of the people constitutes the wealth of the nation; and it is the first duty of the Legislature to strike off any fetters that may appear to restrict the commercialist, the artisan, mechanic, or even the wanderer. The resuscitation and immediate improvement of the wide and now uninviting district of Southwark and East Lambeth would soon reimburse one hundredfold, in a national sense, the remission of some 5,000*l.* a year which is now collected *in mites reluctantly paid*. This is not a joint-stock, but a State question. It is by the Strand, four miles from Westminster to London Bridge, and yet in this space there is but one free bridge (Blackfriars)! No other kingdom, no other capital of the universe, exhibits anything analogous to this absurd system of disseverance.

It may be permitted with great respect to remark, as touching the bazaar bridge shown in the *Builder*, that however meritorious the design, or however remunerative as a paying project, such a structure on any part of our noble river must prove an eyesore that will pervert the beauty of landscape in the country, and obscure and mar the effect of architecture in the city. As an instance, take the Waterworks Bridge at Putney, and that is but a miniature tube or trunk as compared with the two ranges of stalls designed by Mr. Alcock for the purpose of clearing the expenses of foot passengers! Such a structure would present a continuous trunk of at least 14 feet diametrical depth, right across the field of vision. It is hardly necessary to say that this would shut off the varied views of river banks, of spires, or of buildings, as a drop curtain. But take it as pictured: there are to be, say seventy-six stalls on either side: each compartment might afford space for a newsvender, or petty fruiterer: it might pay 10*l.* a year,—or the whole (if let), 1,520*l.* a year. Would this pay? Taken seriously, however, it is not likely that 152 stall-keepers could be found as secure tenants for such a rental, having to confront the weather of our variable climate, *without a fire*, as well as the continuous stream of traffic which such a free causeway would be sure to attract. Whether there is a requirement for the location of so many petty dealers or higglers on the highway is a matter that could be more properly decided by one of the Guildhall magistrates.

The deformity of tubular bridges generally is the great objection to their adoption in the metropolis, where the correlative position and aspect of structures ought always to be taken into account, and the too close propinquity of even the best models is highly objectionable; but the obtrusion of a barrier like the bazaar bridge must impose upon any location a fixed deformity. Old London Bridge, if any of the present generation can remember it, typifies pretty fairly what the bridge of chaffering on the footway might be.

QUONDAM.

"LONDON ARCHITECTURAL SOCIETY."

THE "DINING ARCHITECTURAL CLUB."

A SECOND volume of the London Architectural Society's Essays was published in 1810. The preface tells us it was the society's intention to engrave a selection of designs, but the great expense of the undertaking had deterred them, and they contented themselves with the publication of Mr. Aiken's interesting comparison of the Grecian Dorics, in imperial folio, price 1*l.* 5*s.*, with seven plates.

The second volume contains the following essays:—"On Modern Theories of Taste," by Joseph Woods, jun.; "On Bridge Building," by James Savage; and "On Foundations," by James Elmes. Like vol. I. it contains four plates. The two volumes are not scarce, and are often to be seen moderately priced in sale catalogues.

Can any of your readers inform me if the Dining Architectural Club ever published a volume of essays? It was proposed by them that their members should occasionally furnish the society with essays on subjects of architectural interest, or on some branch of antiquity connected with domestic economy, or the fine arts; and that when a sufficient number of these essays to form a volume had been read, a committee should be appointed to arrange them for publication.

The society met on the 1st day of November, the anniversary of the birthday of Sir Christopher Wren, and dined together at the Freemasons' Tavern; likewise, on the first Tuesdays of the five following months. Among the names of the members were Edward Cresy, Goldicutt, Joseph Gwilt, Thomas Jeans, David Laing, A. Pugin, William Purser, J. Sanders, and G. L. Taylor, architect. I have their card,—a clever etching representing a group of ancient Classic and Gothic buildings, together with a copy of an address read before them at the first meeting of their third session, 1821, by John Britton, their honorary secretary and treasurer.

C. J. B.

THE PNEUMATIC DESPATCH.

ON Thursday, 26th ult., I was called upon by a friend of mine to ask me to go with him to view the "Pneumatic Despatch." I did so; and finding that he was bent upon a trial trip through the tube, I resolved to accompany him, having in my mind that it was almost tantamount to taking my place in the breech of a cannon, and being shot out straight to some "butt" at the opposite end. My first inquiry when I arrived at the station was as to the "buffer" which should protect me from being dashed to pieces on my arrival: this I found by the engineer also to be pneumatic; and satisfied on that head I felt no hesitation to proceed.

On entering the building which inclosed the terminus, and was approached by some descending steps, I had noticed the sloping aperture of the tube: it suggested the idea of a huge iron serpent, the mouth of which was open to receive what it might be presented to its maw; and two small trucks, one for occasional "tourists," and another for luggage, or letter-bags. In a few moments the mail-cart arrived, and its contents were deposited in one of them. This was no sooner done than both were gorged by this metallic leviathan, which immediately shut its upper jaw, and I only heard the whizz of the great fanner that was propelling this double "bolus" on its way.

In about three or four minutes the trucks were heard on their return; and just before their arrival, the monster jaw was again uplifted, and disgorged the now empty receptacles.

It was now our turn to become the food of physic, of this insatiate cormorant; and it seemed to be in effect the latter. My friend stepped into the iron-cradle or truck, lying down and placing his feet towards the head of the carriage, I followed, putting myself in the opposite direction, so that we lay head to foot (a most convenient position for kicking each other's brains out

had any). We were then threadled down by a light cord, the ends of which we were desired to hold in our hands, a most ingenious and simple contrivance adapted to the journey we had to go.

Gently we departed, and in a second or two exchanged remarks on (to our surprise) the *divergence* of the passage from a straight line, and before many more seconds there arose a roar and rumble, the speed increasing, and the passage winding now right, now left, now descending, now rising as if the monster were put to pain in his bowels, and was resolved that, if we could not *see*, we should *feel* it was no light matter to become the proxy of "Her Majesty's Leather Mail."

Well, arrived at our destination at Camden Town, knowing the worst that would befal us, we desired to return as soon as possible, thinking the sooner it was over the better. The officials signalled, and off we set to retraverse the tortuous and rough gullet of this new "Boa *Districtor*," the hurricane which bore us along increasing more and more until within earshot of the station, when the mouth opened at our approach, and we were peacefully restored to "the upper air."

J. T.

PEALS FOR LIVERPOOL.

IN a late number, Haydn Wilson has a letter on the want of peals of bells in various churches in London; written, as I suppose, with a view of inducing architects and others to provide those necessary adjuncts to a church, which, as he justly says, is incomplete without them. Perhaps you would also remind intending builders of churches in Liverpool and neighbourhood, that we are also short of "steeple music," there being only three peals in all Liverpool; and the want might be supplied in any new churches to be built. It certainly does seem very strange that out of about sixty churches there are only these three peals, while there are many towers capable of containing peals of six, eight, or even ten, without in any way being detrimental to the stability of the building.

The people of Liverpool are always ready to come forward with their money for building a new church; and I think if architects and builders were to call their attention to the necessity of having a peal of bells, their efforts would be seconded, and the means provided; as it is probably more from want of thought than apathy in the matter.

MUSIC.

THE PROPOSED BRIDGE AT LUDGATE HILL.

THE great number of new bridges now erecting, or in contemplation, in the metropolis, cannot fail to have been noticed by the most casual observer. You, as editor of the leading architectural journal, have already noticed not only their number, but in many cases their unsightliness.

I would particularly enlist your attention and your aid in the matter of the new railway-bridge, which must, in due course, span the bottom of Ludgate-hill.

A few letters have appeared upon this subject; but their writers do not grapple with the evil, which you, as well as myself, must see will accrue, unless great care be taken with regard to a bridge on the spot in question.

The real point, I think, is, that as a bridge there is inevitable, and that *once there, it is there for ever*, it should be pressed upon the promoters of the scheme, that they should put up a really good structure, worthy of the situation. The small extra cost of such a work would be a mere bagatelle in the entire undertaking. The view of St. Paul's Cathedral, as approached from the West, is fine,—almost beyond comparison,—and is one of the most splendid effects in London.

Is it not, therefore, possible to erect a bridge—as there must be one—worthy of the site? It should be a real work of art; and, I think, of stone. It need not be *very* elaborate.

It might span the entire roadway and paths, and be so treated above, as to be an ornament to the spot, and form a fine foreground to the cathedral beyond.

Surely, when railway companies have so much granted to them, it is not too much to ask them, *for once*, to erect a really fine work, at one particular point. When a line is carried by huge girders over some twenty back streets in Walworth, no one cares very much; but it is or should be a matter of interest to every one, if there is any chance of spoiling, perhaps, the finest and most artistic street view in London. I am sure, sir, I do not go too far when I express my belief that these sentiments, or such as these, must be yours in common with all who take any interest and pride in the appearance and adornment of London.

At all events, I must beg you to pardon the zeal of a

CONSTANT READER OF "THE BUILDER."

*** Is the bridge inevitable? It ought not to be there at all.

REBUILDING OF TUAM CATHEDRAL.

SIR,—My attention has been drawn to a correspondence which has appeared in the columns of your paper relative to Tuam Cathedral. Without at all entering into the controversy whether the building now used for cathedral purposes is an ancient one, or merely a modern building formed out of materials belonging to some ancient structure, I beg to state that there is no intention of taking it down. On the contrary, with the view to the preserving of the windows, piscina, &c., &c., it is intended only to remove the tower,—an ultra disproportioned pile, raised in 1688,—and, by building a suitable western gable, to preserve the present cathedral in its integrity, so that all that any antiquarian can desire will be accomplished, and the church, in addition to a beautiful cathedral, will possess a splendid room for ecclesiastical purposes, which may be also used as a chapel of ease for extraordinary parochial services.

CHAS. H. SEYMOUR, M.A.,
Provost of Tuam, and Hon. Secretary to the Building Committee for Restoration of Tuam Cathedral.

ARTESIAN WELLS IN SOUTH AFRICA.

VIEWED in connexion with what I sincerely hope may now be called the *late* drought in the Northern Section of the colony of the Cape, the question of ARTESIAN WELLS, both in the Cis- and Trans-Gariepine territories, becomes a matter of increasing interest. Dr. Livingstone was the first to call attention to the practicability of these deep wells in certain favourable localities; and little doubt can be entertained that such wells would be successful and a great boon in some parts of South Africa.

Arid Damara and Namaqua land, and the Kalahari, destined some day, I hope, to send, despite their drought, a considerable quantity of alpaca wool and mineral products into the market of the world, seem excluded from the idea that artesian wells can ever be practicable in them; but in the neighbourhood of the Quathlamba, Drakensberg, Megaliesberg, and other tolerably well-watered mountain ranges north and south of the Orange River, there is every reason to believe such wells could be made.

In one of the late numbers of *Chambers's Journal* an article, entitled "The Home of the Gazelle," asserts that, south of the Atlas mountains, in the Algerian Sahára, the French have, within the last few years, made a series of successful artesian borings, much to the astonishment of the Arabs. As the author of the above article derived his knowledge of this fact from private information merely, I should be under great obligation to any of your scientific readers who could, in correspondence with me, substantiate the assertion from French colonial documents. Such information would materially assist in the solution of a question of no little concern to the emigrant English and Dutch, and the native tribes.

JAMES WILSON.

2, Market-terrace, St. Leonard's-on-Sea.

STREET IMPROVEMENTS IN BRADFORD.

No town in England, probably, more needs street improvement than Bradford; the crooked turns and jutting corners of which are a disgrace to the chief town in the worsted manufacture. It is said to want a "back-bone," and well it may; or, at least, if it has one, "rickets" of the worst description must have crooked it out of all similitude to what it ought to be. That any scheme for the street improvement of Bradford should be projected, therefore, is an auspicious circumstance; and this, it appears, is actually the case. A scheme has been brought forward by the corporation; and Mr. Ranger has just been sent to Bradford by Sir George Grey, at the request of the local board of health, in order to institute a preliminary inquiry on the subject. At this inquiry Mr. C. Gott, the borough surveyor, Mr. Lockwood, architect, and others were examined. The surveyor did not give any explicit estimate of the cost of the proposed improvements, but entered into details as to the plans which had been prepared for the widening and improvement of Market-street and other thoroughfares. Mr. Lockwood, in his evidence, said:—It is a great peculiarity of Bradford that there are many lines of street, as in the case of Lower Cheapside, and also of Darley-street, the ends of which abut on buildings. I am reminded of one instance in which a vehicle and horse entered the window of Mr. McCroben; and another in which a carriage and pair entered the adjoining yard, and were stopped at the bottom of a flight of steps. I think it exceedingly important that Market-street should be widened and extended as proposed. This is the only mode by which you can obtain what may be called a "back-bone" for the town. By this you will open up a line of communication from one side of the town to the other, and also relieve the thoroughfares by which you cross the town. If this improvement cost 100,000*l.* it would be well laid out, though still an imperfect one.—The mayor concurred entirely in the evidence of Mr. Lockwood; and agreed with him that it is an imperfect scheme, and that, if he had the power, the scheme should be more comprehensive; but so far as it went it was a good one.

The local *Observer*, in a leading article on the subject, states that the estimate handed in to the Home Secretary is 70,000*l.*; and thinks that this estimate may be under the mark; but adds that, surely this will not deter Bradford from following out a plan which, as far as it goes, is good. Of course there are objectors to it: these, however, while affecting to desire a more complete and thorough improvement scheme, are believed to be really bent on preventing any scheme at all from being carried out.

As being connected with the improvement of Bradford, we may here add that a majority of the subscribers to the Oastler monument have decided by ballot in favour of Bradford, from among other towns that were competing for the honour of giving a site for this monument.

CLERKS OF WORKS AND BUILDERS' CLERKS.

SIR,—In answer to your correspondent, "S. W.," I would remark that the words to which he objects were not used by me in the paper lately read at the Architectural Association.

In the course, however, of a desultory conversation which ensued after reading my paper, some one threw a slur upon the class of builders' clerks which I thought unmerited; and in answering this observation at the conclusion of the discussion, I mentioned what I presume is alluded to by "S. W.," that I should much prefer generally to meet a builder's moneying clerk than the ordinary run of clerks of works in cases of measurement and valuation of works.

Far be it from me to disparage the clerk of works who really understands his business. I am myself indebted for a large part of the instruction I received during my articles to such a one. But I can only repeat that I find too frequently in clerks of works, as they are, young men placed on a building to learn, or old men who take the situation because they cannot satisfactorily fulfil the duties (often more remunerative) of first-class builders' foremen; and who, being in such situation, where they ought to represent the architect, find it more to their interest, from time to time, to take the part of the client or of the builder.

The clerk of works may *have had* more experience than the builder's clerk, but the latter *has* more practice than the former, since he is not confined to one building at a time for his present information. Hence I have found, (and I believe that other profes ional men will back my impression), that a question from a moneying clerk will often throw more light upon a subject than several answers to questions put to a clerk of works.

THOS. M. RICKMAN.

EVERGREENS IN DECORATION.

WE may hope the forthcoming event of the Prince of Wales's wedding will furnish many examples where temporary decoration has been successfully accomplished with inexpensive materials. In many instances this has been anything but well done on former occasions: even the illuminations present too often sameness, bordering, I might almost say, on meanness; stars and crowns succeeding each other with scarcely any diversity. In the decoration of public rooms I would suggest a more liberal display of evergreens than has hitherto been used in the greater number of town houses. Mouldings, gildings, as well as drapery of all kinds, are much relieved by a judicious admixture of foliage. A few bunches of evergreens tell more than flags or a profusion of coloured and white calico. Certainly there are rooms not adapted for wreaths of evergreen, as oak panelled ones. These, of course, show off light drapery to advantage; but in all rooms where the walls and roof are of a light colour, a series of festoons of ivy, or something of that kind, neatly and carefully arranged, present a more cheerful appearance than can be well imagined by all but those who have seen it used. While a plain cornice or angle may be wreathed with flat boughs of common laurel partially overlying each other, the stiffness of the leaf-stalk of the evergreen enables it to retain its freshness some time. Nevertheless, when it can be done, let the branches point downwards rather than the reverse way. All evergreens, we may remark, are not alike useful. Those which wither soon are not suitable, and some have an unsightly appearance on the reverse side.

These ought to be avoided. The best we have seen to form a continuous rope of festoon work are box, ivy, phillyrea, laurestina, alaterius, arbutus, and some others, and Irish yew for stiff upright work. Most of these could be had in tolerable quantity, and would add a richness to the other decoration not to be gained by anything else. J. R.

Books Received.

VARIORUM.

"Crime and Criminals: Is the Jail the only Preventive? By A. Pulling, Esq., Barrister-at-Law. London: Stevens & Haynes. 1863." The principle of the suggestions contained in this tractate is, that certainty of punishment, or of ultimate discomfiture, is a more effectual preventive against crime than any amount of risk; that this certainty would be in a great degree insured if the penalties for crime were made more directly to attach on the property, as well of actual offenders as of those without whose aid or connivance crime could not be carried on with any hope of advantage; and that the chance of escape for criminals would be less if we had a more effective Register of Offenders, and greater surveillance over them when discharged from custody. Some of the suggestions formed the subject of a paper read by the author, before the Law Amendment Society, in December last. Such suggestions as these are well worthy of grave consideration, although there would, we fear, be both complexity and difficulty, as well as often much hardship and suffering to the innocent, in strictly carrying out such a system for the prevention of crime. If the jails were made much more repulsive to the criminal, in the systematic way whereby the workhouses are, and rightly, too, in the main, made repugnant to the feelings of the guiltless poor, a very efficient preventive of crime would thus alone be readily and cheaply secured. As it is, the relative superiority and attractiveness of prisons above workhouses is most injurious. To such an extent does the abominable sympathy for criminals rather than for paupers extend, that if such an order as that lately carried out by the Poor-law Guardians of a northern town, as to doucing in cold and wintry water, clothed or unclothed, every poor wretch who sought the refuge and the tender mercies of the workhouse, man, woman, and child, were ventured on in any of our jails, we do believe that those who ordered so cruel a punishment to the criminals would be dismissed the Government service. When hanging was abolished for so many crimes, corporal punishment ought to have been in many instances substituted, at least in cases of criminal personal violence. Whether it be right or wrong to flog British soldiers who are not criminals for mere breach of discipline, it cannot be far wrong so to punish British garotters and women kickers. By the way, the outbreaks of garotting *at specific times only* is a notable circumstance. The reason why garotting has not been a gradual process, one year with another, but suddenly manifests itself, as it has done on two distinct and separate occasions, ought to be inquired into.——"The Decimal System, as applied to the Weights and Measures of Great Britain. By H. Taylor. Groombridge. 1851." Why a pamphlet of so old a date has been sent to us for review we can only explain by the fact that some of our own remarks on the absurd confusion in which our metrical system is involved have been extensively quoted, and must have been noticed by the author of this well-written and thoughtful pamphlet, who appears to have been an old pioneer in the way of metrological improvement. ——"Report of the Weather for 1862. By Thomas Plant. Birmingham: Smith, Union-street, and railway stations." These meteorological reports originated in a series inserted in the *Birmingham Journal*, *Ariss's Gazette*, and other local papers. They are useful records. In the present report Mr. Plant gives a "caution to architects, builders, &c.," as to the "immense destruction of new and unsubstantially built property" during the gales of the past year; an ugly list of which he gives together in detail, such as we have ourselves given peacemeal, as the occasion required, in the *Builder*.——"The Cotton Famine and the Steam Plough. By John Giles. London: Stevenson, Paternoster-row. 1863." Our readers will recollect of Mr. Giles in the *Builder*. He urges his views ably, though a little eccentrically, in the present little pamphlet; denouncing the military oligarchy of India as an obstacle to agriculture and general progress; and the newspaper press, as the chief instrument of modern governmental despotism (was *Giles's Sydney Review* a newspaper, by the way?); and rightly says:—

"It is of the utmost importance to all the legitimate interests of the British empire that *agriculture*, the supplier of the first elements of every species of property, and the abundance of whose products sets, necessarily, a limit to the expansion of every other branch of industry, and which also defines the consuming capabilities of the great bulk of society, should be possessed of *an efficient industrial system*, and one whose expansive capabilities are equal to the demand made on it by the various branches of manufacturing industry; without the establishment of any systems of social servitude. What the steam-engine has done in *commerce* and *manufacture* it can do in *agriculture*; and by its aid fresh fields for capital enterprise, of unlimited extent and variety, will be opened up, which are now shut up from access to the capitalist through the absence of a reliable and efficient system of industrial power. It is not surprising, therefore, that the requirements of manufacture and commerce, stimulated as they are by the steam-engine, should be short supplied, as well as a limit set to the profitable embarcation of capital in them.

It is only necessary, therefore, to furnish an efficient instrument of agricultural labour to the British capitalist, in order at once to place the manufacturing interests of the country beyond the possibility of short supplies, and at the same time to open up fresh fields of unlimited wealth and enterprise in the development of the vast and now useless agricultural resources of the British dependencies."

——"The Canadian Naturalist and Geologist, and Proceedings of the Natural History Society of Montreal. Vol. VII., December, 1862. No. 6. Montreal: Dawson. London: Bailliere." This appears to be a very useful periodical to all interested in minerals, mines, and geological progress. The present issue contains a long paper on the Acton Copper Mine and various others.——The new number of the *Gentleman's Magazine* contains, amongst other interesting matters, a continuation of the correspondence on "Buildings of the Tenth Century."——The *Art-Journal* for March is a capital number, the steel engravings alone being worth more than its cost. The Illustrated Catalogue of the International Exhibition is continued, with notes on the Raw Materials used by Artists, by Professor Archer. The Cavaliere Migliarini, Mr. Dafforne, Mr. T. Wright, and others, contribute articles.——Laxton's "Builder's Price-Book for 1863," is the forty-third edition of that work,—no small testimonial. The decisions under the Metropolitan Building Act in the Superior Courts are inserted in this edition.

Miscellanea.

SURVEY OF WEST DERBY, LANCASHIRE.—The Local Board of Health have accepted the tender of Messrs. Gotto & Beesley, of Westminster, to make the survey and plans of this district for the purposes of the Local Government Act. The district comprises 6,000 acres and 3,000 houses, and will be shown on two plans—a general plan to a scale of 2 feet to the mile, and a detailed plan to a scale of 10 feet to the mile. The work is to be completed in twelve months.

ANTIQUITIES IN SYRIA AND CYPRUS.—The French Government has caused recent operations and inquiries as to ancient history and relics to be made in Syria and Cyprus, and the results have been published. The island of Cyprus, a most interesting field of inquiry, has not been altogether neglected by our own countrymen. So long ago as 1849, Commander Leycester, R.N., made a surveying excursion in the island, and brought away many copies of inscriptions. Three of these are in an unknown character, which may be called the Cypriote: many others were in Greek. In a recent volume of the Transactions of the Royal Society of Literature, some of the inscriptions are published by Mr. Hogg from Commander Leycester's copies. The Cypriote characters seem to bear some resemblance to the Lycian.

THE CARRIAGE ROAD THROUGH HYDE PARK.—In reply to a question put in the House of Commons by Viscount Enfield, Mr. Cowper said some time since (it may be well to note), that he had long felt that the want of communication between the populous districts of Bayswater and Paddington on the north of the Park, and South Kensington and Chelsea on the south, did absolutely require a public road to unite those districts. He felt it was only a question of time as to when that road would be given, the urgency of it was so great. He was prepared now to say, that it was his intention, when the repairs were completed on the Serpentine bridge, which was being asphalted, in order to prevent the wet percolating through the stonework, to renew the public road in the same direction in which it passed last year. The surface of the road had not been changed. It would be necessary to put up the same kind of fence as was used in the other parts of the park. The road would then be open to cabs and carriages, but not to omnibuses or carts or other heavy traffic.

LIGHTING NEW YORK CHURCHES.—Trinity Church (the principal Episcopal church in New York) is soon to be lighted with gas, instead of candles, as heretofore. Orders have been sent to this country for appropriate fixtures. Two standards, 14 feet high and each bearing forty burners, are to be provided for the chancel, while the rest of the church will be lighted by circles of jets around each column.

BURFORD'S PANORAMA.—In consequence of the decease of the late Mr. Burford, and the termination of the lease of the premises, the present proprietor announces the last season of the panoramas, during which it is intended to reproduce some of the most popular of the late Mr. Burford's works. The capital picture of Rome has consequently been re-opened, and will be followed by Athens, and others at short intervals.

FALL OF SHOP PREMISES.—At Hereford some workmen have been engaged in putting in shop-fronts, and altering the interior, &c., of premises facing Gomond-street. The whole of the interior of the house in question, however, has fallen completely in. The chimney-stack in the centre also fell to the ground. The cause of the accident is believed to have been the removal of supports, which, according to the local *Times*, had been taken away according to the orders either of the builder or the architect.

SANITARY REPORT ON PRESTON.—The report of the borough engineer, Mr. J. Newton, C.E., on the sewerage, improvements, and mortality of the borough of Preston for 1862, has been printed for the corporation. The upper main has been the chief sewerage work for the year, during which, also, 1213 houses have been drained by the local board of health, and 556 by owners. The mortality, however, is still no less that 28·43 per thousand. There were 2,411 deaths and 3,522 births. For the 25 years from 1838 to 1862 inclusive, the mortality was 29·59 per thousand. Infant mortality constitutes a dreadful item in the black list: 49 per cent., or almost one-half of those born, die within five years after birth; 32 per cent. under one year. The factory labour of mothers, who neglect their infants in consequence, leaving them to the charge of miserable hirelings, who probably often feed themselves on the food designed for the infants, is well known to have been one of the chief causes of this dreadful mortality at Preston.

TOWN SEWAGE: RUGBY. — As to whether sewage will pay to apply as a dressing to land, Mr. Campbell, of Rugby, says:—"If water or liquid sewage can be distributed, as has been stated, at a cost of less than a farthing per ton, it ought, under ordinary circumstances, to be remunerative. At Rugby the receiving-tank and engine-house cost 450*l.*; the engine, 300*l.*: instead of 2,350*l.* for laying iron pipes, &c., over 400 acres of land, which it did actually cost, allow 250*l.* for leading it to 100 acres of land; total, 1,000*l.* Population of Rugby, 6,700, connected with sewerage—say 25 gallons of water per head per diem, including rainfall—gives about 750 tons per diem, which at ½*d.* per ton for 300 days—equals 468*l.* per annum; cost of working engine, repairs, &c., &c.—say 250*l.*,—leaves 218*l.* for interest on 1,000*l* 750 tons per diem will give for 300 days 225,000 tons, or 2,250 tons for each acre of the 100. I would expect from this an increased produce of about 10 tons to the acre, which at 10*s.* per ton equals 5*l.*"

THE RAILWAY BRIDGE AT BLACKFRIARS.—At the half-yearly meeting of the London, Chatham, and Dover Railway Company, held last week, Sir M. Peto, M.P., denied an allegation made by Mr. Hartridge that the bridge had been long enough in the possession of the contractors to have had it half completed. With all the engineering talent in the kingdom, he said, and all the force of their own firm combined, the bridge could not have been completed in twelve weeks. The contractors had not had the plans from the City approved more than four months He could give them the assurance that the bridge would be completed and ready for opening with four lines of rails in May of next year. Some misapprehension existed as to the cost of the structure. The cost of it, with two lines, would be 120,000*l.*; but if two more were added, making a double line, it would probably amount to 180,000*l.* The tunnel near Sydenham, 2,200 yards in length, was nearly completed, and they would be in possession of the whole by the 1st of July. They were now in possession of all the land required at Blackfriars Bridge, with the exception of 180 yards, which they would have next week, and there would be no difficulty in completing the line to Blackfriars, including the goods station there, by the 1st of September.

DRINKING FOUNTAIN MOVEMENT.—The authorities at Northampton have accepted an offer, made by Mr. Samuel Isaac, to erect a fountain and lamp, at his own expense, in the centre of the market square. The design is not yet settled.

LEAKAGE OF A RESERVOIR AT SHEFFIELD. — A leakage in the embankment of Dunford Bridge reservoir, says the *Sheffield Independent*, has been discovered. It has arisen from a sinking of the puddle beneath the pipes. Mr. Bateman, the engineer, has taken steps to prevent the extension of the mischief, and to remedy it as soon as possible.

CAN WORK BE DONE WITHOUT BEER?—Paul Bartlett is employed as a labourer at Tudhall Iron Works, Durham, says a correspondent of the *Mining Journal*, and has been a teetotaller fourteen years. His employment consists in wheeling iron to the furnaces. He works nine hours per day, and five days per week. He wheels 24 tons of iron each day, 4 cwt. at a time. The distance traversed is nearly nine miles per day. He thus walks 45 miles per week of five days, wheeling in the same time 120 tons of iron. During the fourteen years, Paul has driven his barrow, with its 4 cwt. of iron, not less than 630 miles, and has wheeled in the same time 87,360 tons. He can on a "pinch" place a ton weight on his barrow and wheel it several yards.

VENTILATING A CELLAR.—"E. C.," in the "Scientific American," says:—In my sitting-room, immediately over the cellar, I have a small cast-iron, air-tight, wood-burning stove, with 3½ feet of 6-inch pipe connected through a thimble with the chimney-flue at about 1 foot from the stove. I have made a ⊤-connection with the stove pipe with pipe of the same size, passing through the floor, and reaching to within 1 foot of the cellar floor. At the top of this pipe, close to the connexion with the stove pipe, there is a valve which regulates the draft of cool air taken from the cellar. The opening in the floor is ½ inch larger than the pipe. The vacuum produced in the cellar by the draught in the chimney-flue draws air down from the chamber through the space around the pipe in the floor. My cellar, which was before damp, is now as dry and pleasant as any room in my house. Formerly, articles placed in my cellar soon became mouldy, and were spoiled for want of ventilation.

FREE LECTURES, BRISTOL SCHOOL OF ART.—On Thursday, 26th ult., Mr. Hammersley delivered his fourth lecture of the afternoon series, on "Art Literature," and in the course of his remarks the lecturer endeavoured to excite in his pupils a love of art reading, that so hand and head might proceed in harmonious progression—the industry of both having a far higher influence than that of mere occupation in tending to the elevation of the whole character. He has since delivered a lecture on "Cement and Manufactures," forming a sequence to his former discourse on "Ornament." In this lecture the application of the principles then laid down was shown as subservient to the comforts and elegancies of life, when judiciously adapted to the various manufactures, without which our houses could not be furnished nor our clothing prepared. From noticing what the practice of the ancients was in this matter, the lecturer went on to point out our duty in relation to the subject, showing that acquiescence in a prevailing taste or fashion was no guarantee for the correctness of that fashion, and that commercial success was no proof of its being right.

OFFORD-ROAD LITERARY INSTITUTE, ISLINGTON.—Among the numerous institutes in the northern parts of the metropolis this one is entitled to special notice, if we are to judge from its recently published programme. A new session commenced on Wednesday evening last, by a lecture "On Art, especially the Artistic Side of Christianity," by the president of the institute, the Rev. John Pulsford, author of a devotional work, titled, "Quiet Hours." The course for the forthcoming quarter also includes a lecture by Mr. John Bennett, on "The Watch, What to make, and How to make it;" an essay by Mr. Gunn on "Church Music and Architecture in their Relation to Public Devotion," to be followed by a discussion among the members; also an original scientific paper on "Light and Colour under different Aspects," by Mr. Bradley; besides a concert of sacred and secular music. It is by attending such institutions and listening to and discussing such subjects as these that both old and young may become mentally improved, and the fine arts and music properly appreciated. If all our towns and villages had their "literary institutes," the inhabitants would have something better to occupy their minds with than local gossip or village scandal.

CHEAP TELEGRAPHIC GOSSIP. — The Electric Telegraphic Company propose to establish a wire communication between individual and individual, at any distance apart, in the metropolis, so that they may gossip, or comfort each other, *ad libitum*, for 15*l.* a year.

A PAPER COFFEE-CUP.—Some ingenious German, says a contemporary, has invented a paper cup, which will completely hold a draught of the hottest liquid, and can be bought for a farthing. By means of this invention the good people of Berlin take up and drink at their ease, as they go along the railroad, the cups of coffee which comfort-loving Englishmen find it impossible to swallow without scalding their throats.

PROPOSED NEW THEATRE, FOR BIRKENHEAD.—At a preliminary meeting held in Birkenhead, it was unanimously resolved that a limited liability company be formed for the purpose of erecting a theatre on a piece of land situate in Grange-lane, near to Charing-cross. Plans and estimates were laid before the meeting, which were approved of,—the estimated cost of land and building, which will be unusually convenient and complete, holding 1,400 persons, not to exceed 8,000*l.*

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—At the society's rooms, in Conduit-street, Dr. C. Dresser delivered an interesting lecture "On applied Art as exemplified in the International Exhibition, 1862." The lecturer went to show that an object might be said to be in good taste in view of several considerations—first, through being perfectly adapted for the purpose intended; secondly, through the thoughts and associations it awakens; thirdly, through the abstract beauty of its forms and colours. The lecture was illustrated by a numerous collection of objects of Japanese and Chinese manufacture, and also by a series of sketches prepared by the lecturer.

DISCOVERY OF A SCULPTURED BULL AT BURGHEAD.—Considerable interest has been excited among local antiquarians, says the *Banffshire Journal*, by an important archæological discovery, made the other day at Burghead, where there has been brought to light another curiously sculptured bull. One of the workmen engaged in excavating the south pier for railway purposes came upon a sculptured stone, which unfortunately did not attract attention until it had been partially destroyed. As a work of art, it falls short of any of the bulls hitherto discovered; while the task of deciphering is rendered somewhat difficult by the loss of the head. The only other two bulls now known to exist, though others are spoken of, are in possession of Mr. George Anderson, Inverness, and Mr. Thomas Milne, Elgin.

BOOK FORM OF "NAPIER'S BONES" FOR EASY CALCULATION. — An ingenious application of Napier's rods or bones to paper and the pocket-book form, has been invented by Mr. R. Dunlop, accountant to the Copper Miners' Company, at Cwm-Avon, Taibach, Glamorganshire, and published, with provisional protection for the invention (Whittington, printer, Post-office, Neath), under the name of "Dunlop's Calculator (No. 1), for performing multiplication and division." By its use the results of calculation from 1-32nd of any weight, number, or measure, to upwards of 99,999, can readily be obtained, for prices varying from 1-32nd of a penny to twenty shillings and upwards. This convenient and curious ready-reckoner must be a useful assistant in warehouses, shops, and sale-yards, especially for fractional calculation.

PUBLIC WORKS AT CHATHAM. — The public works now in progress at Chatham, as well as those intended to be carried out at that garrison during the next financial year, will involve an outlay of close upon 20,000*l.* The most important of the works contemplated is the erection of a gymnasium, the cost of which will be upwards of 5,000*l.*, exclusive of site. The Army Sanitary Commissioners have recommended the erection of such a building at all our large garrisons. The additional buildings now in course of erection include a bakery, in which the bread required for the troops will be baked; a brewery, barrack-rooms, officers' quarters, and other buildings. The various blocks of buildings occupy a portion of the Government land on the outskirts of the garrison. The hospitals for the wives and children of the troops at Chatham, now in progress, will involve an outlay of upwards of 3,000*l.* The estimated expense of re-appropriating Fort Pitt as a hospital for the entire garrison on the removal of the medical school and invalid depôt to Netley Hospital, is 1,000*l.* Upwards of 6,000*l.* will also be required to enable the Royal Engineers to carry on their works during the present year.

"THE HOLINESS OF BEAUTY."—We understand that his Royal Highness the Prince of Wales has been pleased to accept a copy of Mr. Cave Thomas's thoughtful work, "The Holiness of Beauty," reviewed in our pages some time since.

PALL-MALL.—The Marquis of Ailesbury has built a fine ball-room adjoining his residence in Pall-mall (Mr. T. H. Wyatt, architect), and it is proposed to open it on the occasion of the Prince of Wales's marriage, on the 10th inst., with a ball. The floor is laid with Arrowsmith's solid parquetery.

METROPOLITAN ASSOCIATION OF MEDICAL OFFICERS OF HEALTH.—At a meeting held on the 21st ult., at Richmond-terrace, Whitehall, a communication was read from the Secretary of the Epidemiological Society, respecting the proper registration of sickness amongst paupers. Mr. Chadwick then made a proposal in reference to an application to Parliament on the sanitary requirements of public schools. Dr. Murchison read a paper on continued fever, which led to a discussion which was adjourned.

THE LIVERPOOL LABOURERS' DWELLING COMPANY.—At the annual meeting of this company the directors' seventh annual report stated that the average number of houses unoccupied during the year continued larger than they would wish, though not exceeding the average of former years. The directors recommended that a dividend of 3½ per cent. be paid. The chairman said the question might be raised whether it was desirable to continue the company in its present form; or whether they should wind it up. The report was received and adopted. Mr. Muir, of Glasgow, gave some details of the successful experiment of cooking depôts at Glasgow, by Mr. Corbet. A dinner, consisting of a basin of soup, a plate of meat and potatoes, and another plate of plum-pudding, could there be had for fourpence half-penny. The system was doing great good. In Manchester four similar establishments had been started, and they were all successful. Mr. Muir said a duke and duchess had dined and spent a day at the Glasgow establishment, and they expressed their high approval of the general arrangements, the duchess stating that she had had an excellent dinner.

NORWICH SCHOOL OF ART.—The annual *soirée* of the students of this school has taken place in the local Free Library, and was well attended. The school-rooms in the Library were hung with pictures. The chairman said the entire results of the examination could not be known at present, but it appeared that the school had earned thirty-two medals, which was a far greater number than it had ever had before; the greatest preceding number being twenty or twenty-one. But as no school could take more than thirty medals, two would have to be dropped. He then read the names of the medallists, and distributed the prizes. Mr. Keith, in responding to a vote of thanks, congratulated the city on the improvement that was apparent in the school, and expressed a hope that in future the citizens would take greater interest in it. Looking at the population of Norwich, and the many objects of art-interest it contained, he thought the committee ought to be able, after all the trouble they took, to obtain a subscription list of more than 100*l.* a year. He thought it a reflection on the city that it had not taken a greater interest in the school of art.

UNHEALTHY STATE OF EDINBURGH CASTLE.—The report of the commission on barracks and hospitals states that the situation of the barracks at Edinburgh Castle is an exposed, though a healthy one, but the barracks themselves are not amongst the most healthy in Scotland. The mortality in them during the last five years has been 14 per 1,000 per annum; a death-rate considerably above the army average for Scotland for the same five years, which has been 9 3 per 1,000, and much greater than in the other barracks in the city and neighbourhood. The annual mortality from chest diseases and fevers has in Edinburgh Castle been in the ratio of 10 per 1,000 strength. At Piershill Barracks, about two miles distant, it has been under 3 per 1,000, and at Leith Fort about 2½ per 1,000 strength. The greater part of the troops are in the "New Barrack," which is styled a very unfavourable specimen of barrack architecture and arrangement. The means of ventilation afforded by the construction are quite inadequate for the number of inmates. The overcrowding throughout the building is excessive. The improvements suggested by the commissioners are a reduction in the number of inmates; shafts and remodelled grates; removal of ash-pits, and improvement of the washhouses. The commission also recommend various improvements in the hospital.

MR. JAMES DREDGE.—The death of this gentleman, so long known as the inventor of the suspension bridge system which bears his name, recently occurred at his residence, Gothic Cottage, Sion-hill, Bath, after a long illness.

BLASTING POWDER. — Some improvements in the manufacture of blasting powder have been patented by Messrs. Killow & Short, of Delabole; according to which the ingredients used are nitrate of potash, chlorate of potash, nitrate of soda, sawdust, tan, and sulphur. Sometimes they dispense with the potash, and they sometimes substitute turf or peat for the sawdust, or for both sawdust and tan.

LAMBETH BRIDGE. — At the ordinary half-yearly meeting of the Lambeth Bridge company, the directors reported that with their bridge and the proposed new express omnibus the distance from Pimlico to the City will be considerably lessened, and that the receipts enabled the directors to recommend a dividend at the rate of 9 per cent. per annum for the three months. The report of Mr. Barlow, the engineer, was satisfactory.

ACCIDENT ON THE METROPOLITAN RAILWAY. A train which left Farringdon-street, by some unhappy mistake in the working of the points, was sent on to the wrong or western line while the train from Paddington was coming in to the Farringdon-street station, and met it going out near the Clerkenwell Sessions-house. The trains were fortunately running at a slow pace, but several passengers were severely shaken, and others were cut about the face, but no person was killed.

PETROLEUM UNDER A NEW ASPECT. — Not only, it seems, is petroleum destined to be one of the cheapest and most brilliant agents for illuminating purposes, but there are many more applications to which it is suited. It is considered to be a superior lubricator, a powerful heating agent, and an economical and effective substitute for turpentine, benzine, naphtha, &c.: it is used for the manufacture of candles and soap; and it has just been discovered, it is said, that it produces a beautiful varnish, at one half the cost of manufacturing the varnish now generally used. This result, it seems, has been obtained at a refinery at Birkenhead, and the requirements for this cheap article are expected to be very large.

RAILWAY TRAFFIC RETURNS.—The traffic receipts of railways in the United Kingdom amounted for the week ending the 14th of February, on 10,588 miles, to 496,778*l.*, and for the corresponding week of last year, on 10,217 miles, to 457,824*l.*, showing an increase of 371 miles, and of 38,954*l.* in the receipts. The increase on the Great Eastern amounted to 2,698*l.*; on the Great Northern, to 1,082*l.*; on the Great Western, to 2,894*l.*; on the London and North-Western, to 5,569*l.*; on the London, Brighton, and South Coast, to 2,175*l.*; on the London and South-Western, to 1,811*l.*; on the Midland, to 2,330*l.*; on the North-Eastern, to 2,452*l.*; and on the South-Eastern, to 2,062*l.* There was a decrease of 175*l.* on the Great Southern and Western.

THE POLYTECHNIC, REGENT STREET. — On Monday evening Professor Pepper gave a lecture for the first time, entitled "Burning to Death and Saving from Death," illustrating it in his usual agreeable and effective manner. As a close to some well-meant and valuable observations, a young lady, in ample white robes, prepared with the patent incombustible starch, walked with impunity up and down through flames, emulating the Mediæval lady on the plough-shares. The "Spectre Drama," which holds its place, is the most extraordinary illusion ever seen. The images produced by mirrors look more solid and real than the living man standing beside them. Mr. Lionel Brough gives a very entertaining version of "Cinderella," illustrated by dissolving views; the whole forming a wonderful shilling's-worth.

THE LARK NAVIGATION. — The river Lark seems likely to be again pressed into the service of the people of Bury St. Edmund's. The idea has originated from the employment of a peculiar class of steamboat on the Grand Junction and other canals, by means of which a cargo of 50 tons may be carried between seven and eight miles per hour, the depth required being no more than 4 feet. These boats could take in coal at Newcastle and bring it up to Bury at a cost with which no other means of transit could compete, effecting a difference of 4s. per ton in the price of coal. The project, it seems, will very shortly be before the public. A survey of the river has been made for the purpose; and we understand that Mr. Burns, the engineer, employed at present upon the town sewage, has given his opinion that there is no difficulty in obtaining 10 feet of water, if necessary, near the railway station.

PAPIER MACHE CHURCH.—According to the *Critic*, it is said, that in Bergen, a town of Prussia, there is an elegant church, capable of holding 1,000 persons, constructed entirely—statues and all—of papier maché.

A NEW THEATRE IN LONDON.—Arrangements are now in active progress for the construction of a new theatre in the metropolis, the site chosen for which is in the Haymarket, nearly opposite the Haymarket Theatre, and being the ground on which stood the Anglesey Tavern and the livery yard and stables attached.

CITY SUB-WAY.—The Bill authorising the Metropolitan Board of Works to make a new street from Chatham-place to the Mansion House contains a clause, providing that the Board may make under the new street a sub-way, and permit it to be used for the purpose of laying down gas or waterpipes or telegraph wires, "or for any other works or purpose."

INAUGURATION OF THE WEDGWOOD STATUE.—The statue by Mr. G. Davies, of Wedgwood the Potter, at Stoke-upon-Trent, has been inaugurated in presence of a large concourse of people from all parts of the Potteries and North Staffordshire. The Earl of Harrowby, K.G., delivered the inaugural address.

"RECENT ARCHITECTURE IN BIRMINGHAM."—The writer of the article under the above title is glad to find that the elegant building, designed by Mr. Naden, at the corner of Bishopsgate-street, is of brick and stone work, and that the effects are not produced merely on the surface by means of painted stucco. The artificial colouring of the columns and other portions of the work, combined with information from a seemingly reliable source, had led the writer to believe that Mr. Naden's design was open to the objections urged. He is further informed that the preparation used on the stone work, &c., is the invention of Mr. J. W. Ingram, of Birmingham, by whom it has been elsewhere applied for some time.

PUBLIC PARK FOR ASHTON-UNDER-LYNE.—At a recent meeting of the Ashton borough relief committee, the question of providing manual labour for the male adults, in the place of attending educational classes, was discussed, as the latter mode of employment was becoming very irksome to the men. It was suggested that a public park having been long talked of, a deputation should wait upon Lord Stamford to ask him to grant a piece of land for such a purpose, the first sod of which should be cut on the 10th of March, the wedding-day of the Prince of Wales. The suggestion was very favourably received; and ultimately a deputation was appointed to wait upon Lord Stamford's agents to request his lordship to make the desired grant.

ANTIQUARIAN DISCOVERY AT TARSUS.—A correspondent of the *Levant Herald*, writing from Tarsus on the 24th ult., says:—"A very interesting piece of antique sculpture has just been brought to light in the course of some excavations now in progress close to this town. It is a large and splendidly-carved sarcophagus, of white marble, containing a skeleton in a state of excellent preservation, with a funeral stone lamp at its feet. The sides and top of the sarcophagus are thickly covered with beautifully-chiselled hieroglyphics and bas-reliefs of deities, the whole as fine in their outlines as if cut a week ago. Unhappily, our local archæological lore is too scanty to enable us to obtain any reliable clue to the age or connexions of this fine remnant of antiquity; but it is pronounced by the few who do pretend to a smattering of hieroglyphic skill to be at least 3,000 years old. A speculative enthusiast has offered 1,000 liras for it as it stands, but his offer has been refused by the finder."

THE MONTROSE WATERWORKS.—At the Royal Scottish Society of Arts, in Edinburgh, a paper was recently read on this subject by Mr. John Reid. The town is now supplied from the Northesk river by pumping; but the water is first filtered through the strata adjoining into a well which was sunk for the purpose 20 feet, when fine pure water was got in abundance, there being a steady delivery of nearly 180,000 gallons per day before a driftway or conduit was extended towards the river from the bottom of the well, which latter was enlarged to 25 feet diameter, with driftway 3 feet high, 2 feet wide, and 80 yards in length. A gain of nearly one gallon per minute for each yard in length of the drift was got after reaching 50 or 60 yards from the well. The cost of the new and extensive waterworks at Kinnaber was 8,242*l.* The town was first supplied, in 1857, from this source, and the supply continues to be satisfactory.

THE EGLINTON STATUE.—Mr. Matthew Noble has received the commission for executing a colossal bronze of the late Earl of Eglinton, for the town of Ayr.

TENDERS.

For brick sewer in Bow-road and pipe sewers on the British Land Company's estate at Bow. Plans, &c., by the company's surveyor:—

Taylor & Wright	£760 0 0
Ennor	586 0 0
Pound	550 0 0
Hayward	550 0 0
Porter	542 4 0
Kent	515 0 0
Rogers	469 10 0
Horn	455 0 0
Pearce	454 0 0
Brock (accepted)	452 15 10

For forming the roads, yards, &c., at the Stepney Union Workhouse, Bromley, Middlesex. Mr. Henry Jarvis, architect:—

Parker	£845 0 0
Rutty	793 0 0

TO CORRESPONDENTS.

Iron Girders.—W. J. M. writes,—Will any of your readers inform me where a simple formula may be obtained for calculating the strength of "wrought-iron girders," and for determining the resection? Most of the works which treat on this subject contain formulæ for "cast-iron;" but I have searched in vain for the particulars I require.

R. W.—K. A. J.—F. S.—H. H. C. (declined).—J. T.—F. H. & F.—F. T. M.—W. C. T.—J. T.—C. H. S.—C. J. P.—W. S.—Italy (the magistrates will know their claim to the plans. Lawyers differ as to the right).—T. R. S. (letter having appeared elsewhere, has been cancelled). Circular Communications (correspondents who forward communications that have been sent to other journals also, are requested to state the fact).—J. T. L. (It is not a question of support for the roof. A central row of columns in a church would be unsatisfactory). F. B. W—R. R. (already referred to). T. N. R. Veritas.—G. B. N—H. M.—J. D.—J. D. S. (next week).—A. T.—Messrs. T.—J. H.—J. G. H—J. W. I.—T. N.—R. T. S.

We are compelled to decline pointing out books, and giving addresses

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender; not necessarily for publication.

NOTE.—*The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.*

Advertisements cannot be received for the current week's issue later than FIVE o'clock, p.m., *on Thursday.*

☞ *NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent Garden. All other Communications should be addressed to the "Editor," and* NOT *to the "Publisher."*

Just published, Part I. in 8vo. price 5s. sewed,

A DICTIONARY of CHEMISTRY, and the Allied Branches of other Sciences; founded on that of the late Dr. Ure. By HENRY WATTS, B.A. F.C.S. To be continued monthly, and completed in 10 parts, forming three volumes.

ART-JOURNAL for MARCH (Price 2s. 6d.)
The Engravings on Steel are:—"Hagar and Ishmael," by J. C. Armytage, after the painting by J. Clark; "Ulysses deriding Polyphemus," by E. Goodall, after J. M. W. Turner; and "The Monument to Percy Bysshe Shelley," by G. Stodart, from the sculpture by H. Weekes, A.R.A. The literary contributions include:—"The Revival of the Fine Arts in the Eighteenth and Nineteenth Centuries," by the Cavaliere M. A. Migliarini; "Reform of the Patent Laws;" "International Exhibition—France v. England;" "British Artists—Joseph Clark," by James Dafforne, illustrated; "Horace Vernet," "History of Caricature and Grotesque in Art," by Thomas Wright, illustrated; "Armorial Insignia of the Prince and Princess of Wales, illustrated; "Notes on the Raw Materials used by Artists," by Professor Archer. This, the twelfth portion of the Illustrated Catalogue, comprises—Worcester and Parian Porcelain, Works in Ormolu, French and English Clocks, Embroidery and Bookbinding, Lace, Silver Work, Cast-iron and Bronze Chandeliers, Cabinet, Sideboard, Bedroom Furniture, &c. &c.
London: JAMES S. VIRTUE, 26, Ivy-lane.

Now ready, 12mo. strongly bound, price 4s. (postage 4d.)

THE BUILDER'S and CONTRACTOR'S PRICE BOOK. (Lockwood's, formerly Weale's) for 1863, revised by G. R. BURNELL, Esq. C.E. This book is the universally recognized arbitrator in the settlement of disputed accounts. The present edition has been thoroughly revised. Nothing is printed from stereotype plates, as is the case with some books of the kind, errors are not perpetuated, and the opportunity is taken in every reprint to introduce current prices.
London: LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

KELLY'S PRACTICAL BUILDERS' PRICE-BOOK; or, Safe Guide to the Valuation of all kinds of Artificers' Work; with the Modern Practice of Measuring, and an Abstract of the New Building Act for regulating the Construction of Buildings. Revised and Corrected by New Calculations upon the present Value of Materials and Labour. Arranged by an Architect of eminence, assisted by several experienced Measuring Surveyors. Illustrated and exemplified by nine Engravings and numerous Wood-cuts. Royal 8vo. price 8s. neatly bound.
London: published by T. KELLY, Paternoster-row; SIMPKIN and MARSHALL; and may be had of all Booksellers.
Of whom may be had, New Editions in Quarto, of the following Practical Architects' Works:—

1. PETER NICHOLSON'S PRACTICAL CARPENTRY, JOINERY, and CABINET-MAKING. Revised by TREDGOLD: being a new and complete System of Lines, for the Use of Workmen; founded on Geometrical and Mechanical Principles. Ten parts at 2s. or in boards, 20s.; containing upwards of 120 Steel Plates, and numerous Woodcut Diagrams.

2. PETER NICHOLSON'S PRACTICAL MASONRY, BRICKLAYING, and PLASTERING (revised by TREDGOLD), both plain and ornamental; containing a new and complete System of Lines for Stone Cutting, for the Use of Workmen; the Formation of Mortars, Cements, Concrete, to which is added a variety of new designs for Mantel Pieces, Tombs, Gravestones for Cemeteries, &c. &c.; and a description of the various materials employed. Ten Parts at 2s. or in boards, 20s.; containing upwards of Ninety Steel Plates and Numerous Woodcuts.

3. TREDGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS of ARCHITECTURE: containing plain and simple Rules for Drawing and Executing them in the purest style; including an historical Description of Gothic Architecture. Illustrated by upwards of One Hundred Steel Engravings, executed by Artists of first-rate talent, including numerous Diagrams, &c. Twelve parts at 2s.; or in boards, 30s.

4. DESIGNS for COTTAGE and VILLA ARCHITECTURE: containing Plans, Elevations, Sections, Perspective Views, and Details, for the Erection of Cottages and Villas. By S. H. BROOKS, Architect. Beautifully engraved on steel, with Directions for Building, and the estimated Cost of each Edifice. Twelve parts at 2s.; or in boards, 30s.

5. DESIGNS for PUBLIC BUILDINGS, consisting of Plans, Elevations, Sections, Perspective Views and Details of Churches, Chapels, Schools, Almshouses, Gas Works, Markets, and other buildings for public purposes. By S. H. BROOKS, Architect. Beautifully engraved on steel. Ten Parts, at 2s. or 25s. boards.

6. THE HOUSE DECORATOR and PAINTER'S GUIDE: containing a series of Designs for Decorating Apartments with taste, and suited to the various styles of Architecture. By H. W. and A. ARROWSMITH, House Decorators to her Majesty. Ten Parts, at 2s.; or in boards, 25s.

7. THE HOUSE PAINTER, or DECORATOR'S COMPANION: containing a complete Treatise on the Art of House Painting, Graining, and Marbling; including the Origin of Colour, the Laws of Harmonious Colouring, the Manufacture of Pigments, Oils, Varnishes, &c. By W. M. HIGGINS, Esq. Accompanied by actual Specimens of Hand Brush Graining and Marbling. Ten Parts, at 2s.; or in boards, 25s.

THE ENGINEERS' and MECHANICS' ENCYCLOPÆDIA, a new and enlarged edition, comprehending Practical Illustrations of the Machinery and Processes employed in every description of Manufacture of the British Empire. Illustrated by upwards of 2,000 Wood Engravings. By LUKE HERBERT, Civil Engineer, &c. The rapid progress of Mechanical Science has developed many of the important facts since the first publication, in 1836, of the Encyclopædia. The Inventions and discoveries recently made have engaged the sedulous attention of the Editor; for, as the value of each was tested by experiment, a description was accordingly prepared. By the selection of new articles, and care in the revision of old ones, this edition has now become systematically enriched; so that it may be received as fully and faithfully expressing "the existing state of Engineering and Mechanism, adapted to the wants of Practical Men." In two large 8vo volumes, cloth lettered, price 30s.

Forty-third Edition, price 4s. bound in cloth,

LAXTON'S PRICE BOOK for 1863, for ARCHITECTS, ENGINEERS, BUILDERS, CONTRACTORS, SURVEYORS, &c. (established 1816), containing with a variety of new and useful matter, more than 34,000 Prices, embracing all the various trades connected with the operations of the Architect, Engineer, Builder, Contractor, and Surveyor; together with 5,000 useful and important Memoranda relating to the same. Also, full Descriptions of various Stones for Building, from the Quarries of England, Scotland, and Wales. Instructions for Estimating and Contracting. Calculations and Sketches of Cast and Wrought Iron Girders, Columns, &c. &c. The whole carefully revised and corrected to date of publication.
SIMPKIN, MARSHALL, & CO. Stationers' Hall-court, E.C. and all Booksellers in Town and Country.

HERALDRY, HISTORICAL and POPULAR.
By C. BOUTELL, M.A.
750 Illustrations. Price 10s. 6d.
London: WINSOR & NEWTON; and all Booksellers, Artists' Colourmen, &c.

BUILDER'S PRICE LIST BOOK, 1863. Price 2s. 6d.
